In the meantime, expensive equipment is employed; for instance, the cost of equipment used on all railways last year exceeded \$1 for each passenger carried; and as a train piles up mileage very fast, whether fully or only lightly patronized, the large expense involved is a fixture which must be grimly viewed. A particular knowledge of the physical features and conditions of the line, also the fitness of motive power for the service required, must be reckoned in dealing with the season's train service arrangements, and suitable equipment for all requirements must be figured on with much care, and requisitioned a year or more ahead, or at the critical time it will not be available. Naturally, it is far from desirable to have more equipment than required of an unsuitable class, an expense and deterioration which must be rigidly guarded against.

When, with other duties in the provision for and care of the travelling public, a passenger department must provide hotels and restaurants on wheels, and give service, too, in these cramped quarters equal to high class hotels, another specialty is introduced into the work which requires little comment on my part as to its difficulties, cares and triumphs, so that this is the only mention I will make of the sleeping, parlor and dining car service, where courtesy of employees, when cheerfully and helpfully given, shines like a precious gem and makes a traveller happy that his choice led him in such pleasant ways.

Passenger work must be different in different sections of the country. For instance, different methods must be employed in Canada, and especially in Western Canada, from, say, New England. In Massachusetts the population is 419 to the square mile, in Manitoba, the most densely populated province of

Western Canada, 6; in Alberta, 1½, and British Columbia, 1. It is apparent that the railway passenger revenue must be drawn to a considerable extent in Western Canada from the through passenger and new settler, whereas in Massachusetts the local traffic alone is very large. In the latter case the business originates at home and needs to be properly taken care of only, while in Canada we must go far afield, even across the seas, to secure sufficient business to cover the expense of operation of our trains, and the handsomely equipped services, the equal of any in America, which are provided for the public here, are only possible through procuring the greater part of our business from remote districts and countries.

In this connection, and as further illustrating the need of effective colonization work and attracting through business, Lieutenant Butler (later General Sir Wm. Butler), in his record of a journey in 1869-70, between Winnipeg and the Rockies, over the trail which the G.T.P. so closely skirts, in recording his thoughts in camp near Portage la Prairie, says:—"Between this little camp fire and the giant mountains to which my steps were turned, there stood in that long 1,200 miles but six houses. On the same day as I read this I saw a train of eight coaches leave the station at Winnipeg with its human freight for points along the self same trail, and this is a matter of daily occurrence on three railways now."

Needless to say, the passenger department must obtain the fullest co-operation of the transportation and mechanical departments, or it can only succeed to a certain degree in developing traffic. In train schedules and ensuring the on time habit for trains, the cleanliness and upkeep of cars and stations, the proper attitude of employees to the travelling public, all mean service and good returns as contrasted with slovenliness and failure without this active co-operation. In my observations, during many years in railway service, I am convinced that next to inefficiency of the traffic department itself, this lack of co-operation on the part of the transportation department is the most frequent cause of failure for that particular line to stand out prominently above other lines designated as railways, but with no particular features to commend them. This is, of course, deplorable and bears very seriously on the possible revenue of such a company.

Do you realize that failures on the part of any department of the railway to please the exacting traveller invariably lead to the injury of the passenger department in the results which it strives to obtain? A complaint for any cause drifts into the general passenger department, which must endeavor to perpetually smooth over the faults of others as well as its own, and its contact with the public is not always pleasant, however necessary. As a matter of fact, we frequently deplore that we do not receive enough complaints.

We do not render thanks for praise, but we invariably do to anyone who will offer us intelligent comment, criticism or complaint respecting our service, fully realizing the value of it and enabling us to remedy some defect, possibly so slight that it was not apparent to us. My experience has convinced me that good service is always cheaper in every way than only fair or poor service. Good service makes friends who are willing to tell their friends about it, the most valuable advertising results we can procure, and at the least cost; new friends are made in an endless chain. Poor service has the effect of making the once patron look around for another route, and he will not be slow in telling others of his preference.

The results achieved by the passenger department do not all directly contribute to the passenger revenue of a railway. No one has been able to accurately estimate the great benefit to the freight revenue from the large expenditure in advertising and publicity disbursed and charged to the passenger department

revenue, nor has any claim been made by the railways on the government for the peopling of the lands with tax payers, the greatest of all national undertakings, for which the passenger department of a railway is responsible.

Under the Railway Act of Canada, transportation companies are permitted to give special fares and concessions to land settlers, agricultural exhibition managers, exhibitors and commercial travellers. The ultimate results are reaped by the freight department, owing to the settlement of the land, the improvement of crops and the additional sale and distribution of merchandise and supplies.

Effective advertising and good passenger service to the public has influenced the shipper and merchant to forward his merchandise by the same route as he travels. He finds that the route affording comfortable travelling conditions through smooth track and careful train handling does not damage his freight and leaves it in good saleable condition on delivery, as contrasted with the other line, which makes an expense in repairing damage to his goods, besides detracting from their appearance, freshness and other marketable qualities.

Frequent comparison of the two great branches of the traffic is made, and I am often asked if there is not a great similarity in the work of the freight and passenger departments of a railway. Speaking from an experience of twenty-five years, slightly more than half of which was spent in the freight department, possibly some remarks in this connection will be interesting. The freight department may be fairly compared to the wholesale mercantile warehouse, while the passenger department is the department store. The freight department is a seller of the wholesale merchandise branch of transportation, the passenger of the retail, and with this difference the similarity fairly ends. The freight department has the problem of developing and securing traffic which does not move of itself, and where certain fixed principles apply, the results being certain and quick, and in money revenue to the railway usually much greater in bulk than the passenger receipts.

The passenger department, on the other hand, has a new problem to consider in every community, in fact, frequently finds one in every passenger carried, whose prejudices and convenience, no matter how varied and generally fickle, must be carefully taken into consideration at every turn. A passenger has a mind and legs, freight has neither. A new train may be put on to develop and increase travel, but it takes at least six months or longer to demonstrate whether it is a success or otherwise. It may not suit the communities served just right, but a passenger department must take the responsibility for its enterprise and will be judged accordingly, both by the public and the executive heads of the line. Freight business can be handled by the service necessary from day to day. Passenger service must be maintained regularly under all circumstances, whether there be business or not. In fact, there are so many differences in the principles of conducting these respective departments, and so very few of a similar nature, that I am convinced that there is not a more striking likeness between these brothers than there is say, between the passenger and any other department of railway operation. In other words, they are both concerned in selling transportation, but the nature of their goods is so different that the similarity must cease with that general basis.

You have all heard, however, that the freight business is the backbone of a railway's revenue. Let us look into this. The revenue per train mile of all Canadian railways last year yielded for passenger \$1.35, and \$2.38 per mile for freight. The earnings of all trains were \$2.10 per train mile, and the cost of operation \$1.46. It is unfortunate that it is impracticable to separate the abso-

lute cost of operation of freight and passenger trains. The passenger train mileage was 37,000,000, freight 52,500,000. The value of passenger rolling stock used was \$36,000,000, of freight, \$95,000,000, or, roughly speaking, about one-fourth passenger, three-quarters freight. The cost of maintenance and renewals of cars amounted to 9½¢ per passenger, and 16½¢ for freight per train mile. It cost \$250,000 more to pay loss and damage claims for freight than the entire expenditure in advertising conducted by all Canadian lines.

Considering the roomy and expensive terminals necessary for receiving and delivering freight; the long crossing and other sidings necessary at each station, chiefly for freight purposes, also their upkeep; the large staff necessary in all principal terminal and transfer offices to handle freight business, as contrasted with the two or three ticket sellers at the same points; the large number of yard engines and crews for freight service, as contrasted with one or two for passenger service in even the largest yards; the larger use of the railway and greater liability to interruption of traffic with slowly moving as contrasted with express trains; additional crews and fuel necessary to move trains an equal distance to passenger trains and other minor considerations, and it will be readily seen that the earnings per mile of passenger and freight trains respectively are not at all out of proportion to the net results.

I hope, as the result of these few remarks, thorough co-operation with the work of the passenger department will be given, and its fitness allowed for a worthy place in each and every railway family in this great country. Lack of co-operation between departments, or the failure of any unit in the railway organization, is a disaster to the company we serve and a crime towards the country in which we live.

The foregoing paper was read before the Western Canada Railway Club recently.

Railway Conquests of the World.—F.

A. Talbot, who wrote a recently published volume, "The Working of a Great Canadian Railway," has written another one, "Railway Conquests of the World." The latter deals with the romance of railway building, and when it is considered that there are now 700,000 miles of railways in the world, the author had ample material to work upon. Some of the difficulties of the early periods of railway building in the British Isles, the continent of Europe, and in the United States, are graphically told, and there are given such feats as the boring of the Gothard tunnel in Switzerland, the holy railway to Mecca, the highest line in the world, the Cape to Cairo Ry., the building of railways through the Rocky Mountains, the toy railways of Wales and Central Africa. In fact, Mr. Talbot has gathered together in one volume the most important features in the construction of railways in every part of the world, and tells of them in a most interesting manner. The volume is one of the Conquests of Science Series, issued by W. Heinemann, 21 Bedford st., London, Eng., and sold in Canada through the Methodist Book and Publishing House, at \$1.50.

The Canadian Fish and Cold Storage Co., Prince Rupert, has awarded contracts for the construction of three steam trawlers in Selby, Eng., at an approximate cost of \$40,000 each. The dimensions will be, length, between perpendiculars, 118 ft., beam 22 ft., depth of hold 12½ ft. Each vessel will be equipped with triple expansion engines, supplied with steam by Scotch boilers, and they will have a speed of about 10 knots. They are being built to special specification and in excess of classification requirements, 100 A1 at Lloyds. Two of them are to sail from England in Sept., and the third, with the possible addition of a fourth one, in October.

Orders by Board of Railway Commissioners.

Beginning with June, 1904, we have published in each issue summaries of orders passed by the Board of Railway Commissioners, so that subscribers who have filed our paper have a continuous record of the Board's proceedings. No other paper has done this.

The dates given of orders, immediately following the numbers are those on which the hearings took place, and not those on which the orders were issued. In many cases orders are not issued for a considerable time after the dates assigned to them.

16548. May 20.—Authorizing C.P.R. to rebuild bridge 94.8, Moose Jaw subdivision, Sask., and rescinding order 15687, Dec. 27, 1911, giving similar authority.

16549, 16550. May 20.—Recommending to the Governor-in-council agreements between Canadian Northern Ry. and Midland Ry. of Manitoba (G.N.R.) for operation as joint section from International boundary to Woodward Ave., Winnipeg, and authorizing such operation for 30 days, when, if not approved by Governor-in-council, operation shall cease.

16551. May 20.—Approving location of Central Ry. of Canada from C.P.R. near McAlpine station, mileage 7.2, to G.T.R. near South Indian station, mileage 38.165, Russell county, Ont.

16552. May 21.—Authorizing J. Battle, Thorold, Ont., to build chute under G.T.R. Stuart St. station yard, Hamilton.

16553. May 20.—Ordering G.T.R. by Aug. 1 to install electric bell at crossing of con. 3, Stamford tp., Ont., 20% to be paid from the railway grade crossing fund.

16554. May 20.—Approving Kettle Valley Ry. location from mileage 4.80 to 38.99, west of Penticton, B.C.

16555. May 20.—Authorizing Vancouver and Lulu Island Ry. (C.P.R.) to build second track across 11 roads and streets in Point Grey municipality, B.C.

16556. May 17.—Dismissing application of Canadian Press, Ltd., requiring Great North West and Western Union Telegraph Cos. to provide special press service tolls similar to C.P.R. and ordering C.P.R., G.N.W. and Western Union Telegraph Cos. to restore rate of 25c per 100 words for press specials in Maritime Provinces, effective by June 17.

16557. May 21.—Authorizing G.T.R., Georgian Bay and Seaboard Ry. (C.P.R.) and C.N. Ontario Ry. to operate over interlocking plant at Atherley Jct. without previously stopping, interlocker being completed.

16558. May 20.—Approving express collection and delivery limits for Grand Falls, N.B.

16559. May 20.—Ordering G.T. Pacific Branch Lines Co. to place crossing on E. D. Sworder's property, Balcarres, Sask., in proper condition for tram traffic by June 30, under penalty of \$25 a day.

16560. May 21.—Authorizing C.P.R. to divert Government road, mileage 9.92, on Waldo branch, B.C.

16561. May 20.—Authorizing C.P.R. to rebuild bridges 66.77, 19.7 and 6, Cartier and Havelock subdivisions, and Orford Mountain branch, Eastern Division.

16562. May 21.—Authorizing James Bay and Eastern Ry. (C.N.R.) to build bridge across River a l'Ours, Ashuapmouchouan tp., Que.

16563. May 20.—Approving location of C.N. Quebec Ry. station and baggage room at Sixteen Island Lake, Que.

16564, 16565. May 21.—Approving revised location of C.N. Ontario Ry. Toronto-Ottawa line, west of Newburgh, and authorizing it to cross public road between lots 20 and 21, con. 2, Thorah tp.

16566. May 21.—Authorizing G.T. Pacific Branch Lines Co. and C.P.R. to operate over interlocker at crossing of former's Melville-Regina branch and latter's Bulyea branch.

16567. May 21.—Authorizing C.N. Ontario Ry. to build bridge over Otter Creek, mileage 204 from Toronto.

16568. May 22.—Ordering C.P.R. to instal within 90 days electric bell at main trail near Hesperus, Alta., 20% to be paid from railway grade crossing fund.

16569. May 15.—Approving diversion and crossings of C.P.R. in Purdue rural municipality, 346, Sask.

16570. May 22.—General order re fire prevention on railways.

16571. May 21.—Authorizing Port Arthur and Fort William Electric Ry. to operate over C.P.R. crossing at Pacific avenue, Fort William, Ont.

16572. May 21.—Approving plan A for subway under C.P.R. at 9th avenue east, Calgary, Alta.

16573. May 21.—Authorizing C.P.R. to cross 25 highways with its Swift Current northwesterly branch, and approving location, mileage 78.00 to 111.14.

16574. May 21.—Authorizing C.P.R. to build extension to spur for Dominion Gypsum Co., Winnipeg.

16575. May 22.—General order re forged steel wheels on tender trucks.

16576. May 22.—Authorizing C.P.R. to build cement foot subway at George street, Smiths Falls, Ont.

16577. Mar. 8.—Ordering C.N. Ontario Ry. to erect and maintain a flag station at eastern extremity of Deaf and Dumb Institute grounds near Belleville, Ont.

16578. May 23.—Approving agreement between Bell Telephone Co. and Algoma Steel Co., Sault Ste. Marie, Ont.

16579. May 22.—Authorizing G.T.R. to use jointly with C.P.R., spur to Toronto Furniture Co., Toronto.

16580. May 23.—Authorizing C.P.R. to build second main track across five highways on its Kenora subdivision.

16581. May 23.—Authorizing C.P.R. to build spur for Western Foundry and Machine Co., Saskatoon, Sask.

16582. May 22.—Authorizing Dominion Atlantic Ry. to build its North Mountain branch across highways between Centreville and Weston, N.B.

16583, 16584. May 23.—Authorizing C.N. Ontario Ry. to build bridge over Riviere des Milles Isles, mileage 37.9 from Hawkesbury, Ont., and to cross three highways in Bristol tp., Que.

16585. May 9.—Authorizing C.N. Ontario Ry. to connect temporarily with siding of Canada Cooperaage Co. Smiths Falls.

16586. May 23.—Approving C.N. Ontario Ry. revised location in Ross and Westmeath tps., mileage 69.15 to 71.08 from Ottawa.

16587. May 22.—Authorizing C.N. Ontario Ry. to build spur for Shevlin Clarke Lumber Co., Fort Frances.

16588. May 23.—Authorizing St. Cuthbert parish, Que., to build highway across C.P.R. two miles east of St. Cuthbert.

16589. May 20.—Approving G.T. Pacific Ry. location through Port William, Ont., in accordance with agreement between the city and C.P.R., and rescinding order 8493, Oct. 6th, 1909, in the same connection.

16590. May 27.—Authorizing G.T.R. and C.P.R. to operate over interlocker at Nipissing Jct. without previously coming to a stop.

16591. May 27.—Approving Toronto Eastern Ry. revised location through Whitby and Whitby East tps., Ont.

16592. May 23.—Authorizing G.T. Pacific Ry. to build farm type of crossing over C.P.R. near dock in Vancouver, B.C.

16593. May 27.—Approving C.N. Ontario Ry. revised location through Gibbons and Crerar tps., mileage 267.2 to 271.4 from Ottawa.

16594. May 27.—Approving C.N. Quebec Ry. location through Two Mountains and Terrebonne counties, mileage 16.71 to 33.04.

16595 to 16597. May 27, 23.—Approving Canadian Northern Ry. location through tps. 39-42, r. 1, w. 3 m., to tp. 27 w. 2 m., mileage 0 to 26.56 and location of its Alsask southeasterly line through tps. 25-26, r. 15-20, w. 3 m., mileage 49.59 to 85.24; and authorizing it to cross C.P.R. Calgary-Edmonton branch with its Strathcona-Camrose branch in n.w. ¼ sec. 16, tp. 52, r. 24, w. 4 m., Alta., interlocker to be installed.

16598, 16599. May 23, 27.—Authorizing Campbellford, Lake Ontario and Western Ry. (C.P.R.) to connect with Ontario and Quebec Ry. (C.P.R.) at Glen Tay, and approving revised location at Glen Tay to mileage 2.08.

16600. May 23.—Authorizing C.P.R. to build three additional tracks across Wolever Ave. and public lane in Winnipeg.

16601. May 27.—Approving C.P.R. revised location from mileage 0 at Bassano for 35.38 miles, sec. 3, tp. 25 and 22, w. 4 m., Alta.

16602. May 23.—Authorizing C.P.R. to take certain Toronto belt line lands in connection with diversions of St. Clair Ave. and Scarlett Rd., Toronto.

16603. May 27.—Dismissing Bell Telephone Co.'s application re crossing C.P.R. and G.T.R., Brock Ave., Toronto.

16604. May 27.—Authorizing C.N. Ontario Ry. to cross public road on lot 21, r. 2, Clarendon tp., Que.

16605. May 28.—Authorizing Alberta Central Ry. (C.P.R.) to divert trail at Rocky Mountain House by overhead bridge.

16606. May 28.—Authorizing Esquimalt and Nanaimo Ry. to build bridge 4.5 near Victoria, B.C.

16607. May 27.—Dismissing application of Campbellford, Lake Ontario and Western Ry. (C.P.R.) for crossing of G.T.R. at mileage 70.74 from Glen Tay, Ont.

16608, 16609. May 27.—Authorizing C.P.R. to build spurs for W. Bannerman Co.'s ballast pit at mileage 2, Ignace subdivision, Ont., and for E. Hogg, near Agassiz, B.C.

16610. May 28.—Authorizing C.N. Ontario

Ry. to cross temporarily concession road in Georgina tp., by agreement with township.

16611. May 28.—Authorizing C.P.R. to connect with G.T.R., take certain lands and divert lanes, etc., near Clarence Sq., Toronto, in connection with freight terminal enlargement.

16612. May 27.—Extending to July 1 time for completion of C.P.R. spur in West Oxford tp., Ont., as authorized by order 15542, Nov. 22, 1911.

16613. May 28.—Further extending to Dec. 1 C.P.R. Telegraph Tolls, C.R.C. 5.

16614 to 16617. May 28.—Authorizing C.P.R. to build two spurs for H. S. Gree, Kildonan parish, near Winnipeg, Man.; Canada Sand-Lime Pressed Brick Co., Symes Rd., Toronto.; British Columbia Brass, Ltd., New Westminster, B.C., and Argenteuil Granite Co., Chatham tp., Que.

16618. May 27.—Authorizing G.T. Pacific Ry. and Midland Ry. of Manitoba to operate trains without stopping over interlocker parish lot 55, St. Boniface, Man.

16619 to 16624. May 28.—Extending to Dec. 1 G.N.W., G.T.F., C.N.R. White Pass and Yukon and North American Telegraph and Bell Telephone Companies' tariff of tolls authorized by former orders or acts 7-8, Edward VII, chap. 61.

16625. May 29.—Extending to July 1, time for completion of fencing Great Northern Ry. from m.p. 63 to 77, as directed by order 16131, Mar. 13.

16626. May 23.—Ordering Canadian Northern Ry. to install improved type of electric bell at Bay Bridge Rd., Belleville, Ont.

16627. May 28.—Authorizing Vancouver, Victoria and Eastern Ry. (G.N.R.) to build dock and warehouse at Burrard Inlet, B.C., and rescinding order 15093, Oct. 16, 1911, to the same effect.

16628. May 29.—Approving C.N. Ontario Ry. revised location through Clarendon tp., Que., mileage 55 to 58 from Ottawa.

16629. May 29.—Authorizing Canadian Northern Ry. to divert public road on its Swift Current extension, Sask.

16630 to 16632. May 30.—Approving C.P.R. plans of bridge 61.51, Woodstock subdivision, N.B., and authorizing it to rebuild bridges 58.59, Cartier subdivision, Ont., and 57.1, Cascade subdivision, B.C.

16633. May 29.—Authorizing G.T.R. to rebuild bridge carrying highway in Caradoc tp., Ont.

16634 to 16636. May 30.—Dismissing application of city of Hamilton, Ont., to continue Lottridge St. across Toronto, Hamilton and Buffalo Ry., Hamilton Radial Ry. and G.T.R.

16637. May 29.—Relieving Great Northern Ry. from erecting and maintaining fences from International boundary to Brandon, Man.

16638. May 29.—Authorizing Essex Terminal Ry. and Michigan Central Rd. to operate trains over crossing at Windsor, Ont., without stopping.

16639. May 29.—Extending to July 1, time for installing derrails by G.T.R. at Toronto Suburban Ry. crossing, Keele St. and St. Clair Ave., as ordered by order 16411, Apr. 19.

16640. May 28.—Authorizing city of Lethbridge, Alta., to build crossing over C.P.R. at 13th St., for one year, watchmen to be employed by city.

16641. May 29.—Extending to Aug. 31 time for completion of highway diversion and crossing of C.P.R. at Foam Lake by Saskatchewan Government as authorized by order 15770, Jan. 11.

16642. May 29.—Authorizing G.T.R. to build additional track across Bedford St., Brantford, Ont.

16643. May 30.—Authorizing Quebec Ry., Light, Heat and Power Co. to build spur for Beupre Sand Co., Ste. Anne de Beupre, Que.

16644. May 29.—Authorizing Michigan Central Rd. to build spur for Dominion Cannery, Ltd., Niagara-on-the-Lake, Ont.

16645. May 29.—Approving location of Vancouver, Victoria and Eastern Ry. (G.N.R.) station at White Rock, B.C.

16646. May 28.—Authorizing C.N. Ontario Ry. to connect with C.P.R. at Meadowsdale, Nipissing District, for six months for construction purposes only.

16647. May 30.—Approving location of C.P.R. Kerrobert northeasterly branch from mileage 20 to 36.08, Sask.

16648. Apr. 23.—Approving location of C.P.R. freight shed at Saskatoon, Sask.

16649, 16650. May 29.—Authorizing Kettle Valley Ry. to cross highway at mileage 10.5, northwest of Penticton, and to cross six highways in Summerland municipality, B.C.

16651. June 1.—Authorizing C.P.R. to build three spurs for Union Stock Yards Co., Toronto.

16652. May 30.—Relieving Vancouver, Victoria and Eastern Ry. (G.N.R.) from erecting fences along certain portion of its line.

16653. May 31.—Authorizing city of Ham-

ilton, Ont., to build subway under G.T.R. near Sherman Inlet (Birch Ave.).

16654. May 29.—Authorizing G.T. Pacific Ry. to build branch into secs. 18 and 7, tp. 53, r. 23, w. 4 m.

16655. May 31.—Authorizing C.N. Ontario Ry. to build spur from its joint section of C.P.R. spur in Parry Sound for Canada Chemical Co.'s smelter.

16656. May 31.—Extending to Oct. 1 time for installation of interlocker by C.N. Ontario Ry. at crossing of C.P.R. and G.T.R. near Ottawa, authorized by order 11386, Aug. 6, 1910.

16657, 16658. May 30, 31.—Authorizing Campbellford, Lake Ontario and Western Ry. (C.P.R.) to cross C.N. Ontario Ry. in lot 27, con. 2, Pickering tp., and Pointe Anne Ry. Co. (Canada Cement Co.), in lot 15, con. 1, Thurlow tp., interlocking plants to be installed.

16659. May 30.—Approving location of Campbellford, Lake Ontario and Western Ry. (C.P.R.) from mileage 72 to 75.45, Ont.

16660. May 27.—Ordering C.P.R. to file within 90 days, plan showing location of junctions with Canadian Northern Ry., and interlocking signalling system to govern train movements.

16661 to 16663. May 31.—Dismissing C.P.R. applications to build its Lambton to Weston branch across certain highways in York and Etobicoke tps., and to connect with Toronto to Owen Sound line near Toronto, and to build branch from its Toronto to London line to connect with Toronto to Owen Sound line near Toronto.

16664. May 30.—Authorizing C.P.R. to take certain lands in St. Andrew's ward, Montreal.

16665. May 31.—Ordering that C.P.R. crossing at Dovercourt Rd., Toronto, be protected by day and night watchman, one-half wages to be paid by city of Toronto and one-half by C.P.R.

16666. June 4.—Authorizing G.T. Pacific Ry. to open for traffic its line from mileage 100 to 164 west of Prince Rupert, B.C., speed of trains limited to 25 miles an hour.

16667. May 31.—Ordering C.P.R. to install standard gates at crossing in Hartland, N. B., within 60 days, to be operated between 7 a.m. and 6 p.m. daily, 20% of cost to be paid from railway grade crossing fund.

16668. June 1.—Authorizing Vancouver, Westminster and Yukon Ry. and C.P.R. to operate trains over crossing at Burrard Inlet, Vancouver, B.C., without stopping.

16669, 16670. May 30.—Approving location of Campbellford, Lake Ontario and Western Ry. (C.P.R.) from mileage 106.7 to 123 from Glen Tay, and authorizing it to cross Thurlow Ry. by overhead bridge to Canada Cement Co.

16671. June 1.—Ordering G.T.R. to compensate existing landowners on either side of Ferguson Ave., Hamilton, Ont., who were owners prior to establishment of Cannon St. yard, or who have option of purchasing same outright.

16672. June 5.—Authorizing C.P.R. to open for traffic its double track from St. Martin's Jct. to St. Therese, Que., 7.22 miles.

16673. June 4.—Authorizing G.T. Pacific Ry. to build two spurs for Alsip Brick and Supply Co., Edmonton, Alta.

16674. June 7.—Authorizing G.T. Pacific Ry. to cross and divert highway at mileage 58.3, Alberta.

16675, 16676. June 7, 4.—Authorizing G.T. Pacific Branch Lines Co. to cross two highways on its Biggar-Calgary branch, and to divert road from mileage 36.4 to 36.8 on its Regina-Moose Jaw branch.

16677. June 5.—Authorizing G.T. Pacific Ry. to cross highway at mileage 193.5, r. 6, Cassiar District, B.C.

16678. June 4.—Approving location and plans of G.T. Pacific Branch Lines Co.'s station at Bardo, on its Tofield-Calgary branch.

16679. June 5.—Authorizing G.T.R. to build siding for Canada Brick Co., near Montreal.

16680. June 6.—Authorizing G.T.R. to rebuild bridge 4.90, District 16, near Watford, Ont.

16681. May 30.—Authorizing G.T.R. to build two additional tracks across Bay St., Kingston Ont.

16682, 16683. June 4.—Authorizing G.T.R. to build sidings for Bronson Co., Ottawa, and Dominion Flour Mills Co., Montreal.

16684. June 8.—Extending to July 15, time for completion of transfer track, between Brandon, Saskatchewan and Hudson Bay Ry. (G.N.R.) and Canadian Northern Ry. at Minto, Man., as authorized by order 16501, May 10.

16685. June 4.—Extending to Nov. 30, time for construction by C.P.R. of spur to ballast pit near Marquette, Man., as authorized by order 16289, Apr. 10.

16686, 16687. June 7, 6.—Authorizing

C.P.R. to build spurs for F. H. Wiley, Winnipeg, Man., and Hub Roofing and Cornice Works Co., Saskatoon, Sask.

16688. June 8.—Approving location of C.P.R. station at Yahk, B.C.

16689. June 5.—Authorizing C.P.R. to build spur for National Portland Cement Co. near Hanover, Ont.

16690. June 8.—Authorizing C.P.R. to rebuild bridges 86.1 and 57.9, Havelock and London subdivisions, Ont.

16691. May 4.—Authorizing C.P.R. to build spur for Winnipeg Supply Co., Winnipeg.

16692. June 6.—Authorizing C.P.R. to rebuild bridge 113.5, Cascade subdivision, B. C.

16693. June 4.—Authorizing C.N. Ontario Ry. to cross two highways in Ross tp.

16694, 16695. June 4, 7.—Authorizing Campbellford, Lake Ontario and Western Ry. (C.P.R.) to take portion of C.N. Ontario Ry. right of way at mileage 79.5, Sidney tp., and approving revised location from mileage 140.63 to 147.89 from Glen Tay.

16696. June 7.—Approving C.N. Ontario revised location through unsurveyed territory, Thunder Bay District, mileage 142.8 to 148.4 from Port Arthur.

16697, 16698. June 4, 6.—Authorizing Canadian Northern Ry. to cross with its Swift Current branch 23 highways in Saskatchewan, and with its Macleod-Calgary branch, 24 highways in Alberta.

16699. May 31.—Authorizing city of Hamilton, Ont., to carry Dunsmuir road across Toronto, Hamilton and Buffalo Ry. spur.

16700, 16701. June 1, 4.—Authorizing Edmonton Radial Ry. to cross G.T. Pacific Ry. at Spruce Ave., Edmonton, Alta., and at intersection of 21st St. with Short and Nelson Aves; half interlockers to be installed.

16702. June 7.—Ordering Great Northern Ry. to fence its right of way from Elko, B. C., to international boundary, with exception of where it skirts the Kootenay River, etc.

16703. June 7.—Authorizing Alberta Government to build highway across C.P.R. on north boundary of n.e. ¼ sec. 3, tp. 39, r. 27, w. 4 m.

16704. May 31.—Authorizing Montreal Tramways Co. to rebuild bridge over C.P.R. near Blue Bonnets, Que.

16705. June 5.—Ordering that provision of order 16479, May 10, re classification of gramophones, etc., be put into effect not later than July 15. This order is given in full on another page.

16706. June 5.—Authorizing Peterboro' Radial Ry. to cross C.P.R. and G.T.R. at Park St., Peterboro', Ont.

16707. June 4.—Amending order 16453, of May 6, by substituting 40,000 lbs. for 30,000 lbs. Order 16453 is given in full on another page.

16708. May 31.—Ordering Toronto, Hamilton and Buffalo Ry. to protect Walnut St. crossing, Hamilton, Ont., by day and night watchman; gate question reserved.

16709. June 5.—Recommending to Governor-in-Council agreement between Atlantic Quebec and Western Ry. and Quebec Oriental Ry. for joint shops at New Carlisle, Que.

16710. June 4.—Approving revised rule relating to baggage of excess size as follows:—Commencing July 1, for any piece of baggage of any class, except immigrant baggage checked at port of lading, and whips in canvas or leather cases, the greatest dimension of which exceeds 45 ins., there will be an additional charge for each additional inch equal to the charge for 5 lbs. of excess baggage.

16711. June 7.—Authorizing G.T.R. to build additional team tracks along and across Esplanade St., Toronto.

16712. June 8.—Authorizing C.N. Ontario Ry. to cross public road on lot 11, r. 2, Clarendon tp., Que.

16713. June 8.—Authorizing C.P.R. to open for traffic its double track from mileage 92.4 to 105.7, at Carberry, Man.

16714 to 16717. June 6, 7.—Authorizing C.P.R. to build spur for T. D. Robinson and Sons, Winnipeg; M. Rumely Co., Saskatoon, Sask.; International Harvester Co., Lethbridge, Alta., and Harbor Commissioners, at Bureau Wharf, Three Rivers, Que.

16718. June 8.—Authorizing C.P.R. to cross Saskatchewan Ave., Edmonton, Alta., overhead, and Hardisty Ave., at grade.

16719. June 1.—Approving location of Lake Erie and Northern Ry., from Grand River to Colborne St., Brantford, Ont.

16720. June 10.—Approving change in location of C.P.R. at Vancouver, B.C.

16721. June 10.—Authorizing C.N. Ontario Ry. to open for traffic its line from Trenton to Deseronto and rescinding orders 15211, Oct. 28, 1911, and 15940, Feb. 13, covering same territory in two sections.

16722. June 14.—Ordering G.T.R. to re-

locate loading siding and to erect fruit shed east of Vineland station, Ont.

16723. June 11.—Approving Algoma Eastern Ry. location across Little Current channel, Ont., between mileage 79.80 and 80.69.

16724. June 4.—Approving G.T. Pacific Ry. plans for freight shed at mission terminals, Fort William, Ont.

16725. June 11.—Approving Georgian Bay and Seaboard Ry. (C.P.R.) plan for interlocker in swing bridge over Trent canal, mileage 44, Ont.

16726. June 13.—Approving Kettle Valley Ry. plan for 250 ft. deck span over Trout Creek, near Pentteton, B.C.

16727. June 8.—Authorizing G.T. Pacific Branch Lines Co. to open for traffic its Tofield-Calgary branch from Red Deer, mileage 83.5, to Trough, mileage 121.4, Alta.

16728. June 10.—Authorizing G.T.R. to build bridges 189, Northern Division, and 77, Ottawa Division, Ont., and approving stress sheets.

16729, 16730. June 10.—Relieving Vancouver, Victoria and Eastern Ry. from erecting fences from Blaine to Brownsville, B.C.

16731. June 11.—Extending to July 15, time for C.N.R. to put tracks at Saskatoon, Sask., in good shape.

16732 to 16735. June 11, 10.—Ordering Dominion Atlantic Ry. within 60 days to install improved electric bells at four street crossings in Windsor, N.S., 20% of cost to be paid from railway grade crossing fund.

16736, 16737. June 11, 13.—Approving C.N. Ontario Ry. revised location through Torbolton and Fitzroy tps., Ont., mileage 27 to 37.01 from Ottawa; and through Fitzroy, Onslow and Bristol tps., Que., mileage 36 to 40 from Ottawa.

16738, 16739. June 14, 12.—Authorizing C.N. Ontario Ry. to build across Leamy Creek, Nepean tp., and approving revised location through Barron and White tps., Nipissing district.

16740. June 14.—Authorizing Canadian Northern Ry. to cross with its Vonda northerly line, 11 highways in Saskatchewan.

16741. June 14.—Authorizing G.T. Pacific Ry. to build across highway at mileage 194.8, Cassiar district, B.C.

16742. June 13.—Approving location of G.T.R. new station at Stratford, Ont.

16743. June 14.—Authorizing Campbellford, Lake Ontario and Western Ry. (C.P.R.) to cross two highways in East Whitby tp., Ont.

16744. June 13.—Authorizing C.P.R. to build additional track across highway at mileage 107.38, on Cascade subdivision, B.C.

16745, 16746. June 12, 14.—Authorizing C.P.R. to rebuild bridges 17 and 17.9, Swift Current subdivision, Sask., and relieving it from further protecting crossing of Main St., Walton, Ont.

16747. June 15.—Ordering Central Vermont Ry. to extend its siding at Stone, Que.

16748. June 17.—Authorizing G.T.R. to build two sidings across William St., Kingston, Ont.

16749. June 8.—Authorizing C.P.R. to take lands at Leaside Jct., for new station site, and approving location of site.

16750 to 16754. June 13, 11, 14.—Authorizing C.P.R. to build spurs for Alaska Bedding Co., Regina, Sask.; J. McDiarmid Co., Calgary, Alta.; American Lumber Co., Sumas Jct., B.C.; Canadian Sardine Co., Chamcook station, N.B., and Saskatoon Lumber Co., Saskatoon, Sask.

16755. June 14.—Authorizing C.P.R. to build two additional tracks across road allowance at mileage 176.57, Calgary subdivision, Alta.

16756. June 14.—Rescinding order 16713, June 8, and authorizing C.P.R. to open for traffic its double track from mileage 98 at Melbourne to Carberry, Man., mileage 106.

16757. June 10.—Extending to July 15, time for C.P.R. to complete fencing on its Moose Jaw southwesterly branch, ordered by 15864, Feb. 1.

16758. June 15.—Authorizing Campbellford, Lake Ontario and Western Ry. (C.P.R.) to cross 12 highways in Bedford and Hinchinbrooke tps., Ont.

16759, 16760. June 8, 15.—Authorizing C.P.R. to build bridge 0.3 over Saskatchewan River, Calgary subdivision, Alta., and to rebuild bridge 124.4, Muskoka subdivision, Ont.

16761, 16762. June 13, 17.—Authorizing C.P.R. to build additional track across highway at Westminster Jct., New Westminster, and at Kyle St., Port Moody, B.C.

16763, 16764. June 14.—Approving changes in location of C.P.R. stations at Plaisance, Que., and Hammond, Ont.

16765 to 16768. June 15, 13, 10.—Authorizing G.T.R. to build spurs for British Canadian Cannery, Cobourg, Ont.; Dain Manufacturing Co., Humberstone tp., Ont.; London Concrete Machinery Co., London, Ont., and Alaska Feather and Down Co., Montreal.

16769. June 11.—Authorizing G.T.R. to rebuild bridge at milepost 20.56, district 22, Waterloo tp., Ont.

16770, 16771. June 13, 15.—Authorizing G.T. Pacific Ry. to cross two highways in Cassiar and Coast districts, B.C.

16772, 16773. June 8, 15.—Authorizing G.T. Pacific Branch Lines Co. to build station at Prongua on its Cutknife branch, Sask., and approving location of station at Rowatt, Sask.

16774. June 13.—Authorizing G.T. Pacific Ry. to cross highway at mileage 90.5, North Alberta district.

16775. June 17.—Authorizing G.T. Pacific Branch Lines Co. to take possession of C.P.R. land for right of way of its Tofteld-Calgary branch.

16776, 16777. June 10, 17.—Authorizing Algoma Eastern Ry. to build swing bridge at Little Current, between Goat and Manitoulin islands, and to connect with C.P.R. Sault branch and Canadian Copper Co.'s spur, Drury tp., Ont.

16778. June 11.—Authorizing Algoma Central and Hudson Bay Ry. to cross highway between Cathcart St. and Wilde Ave., Tagona, Ont.

16779. June 11.—Approving C.P.R. plans of subway at Jasper Ave., and bridges at McKay and Victoria Aves., Edmonton, Alta.

16780, 16781. June 10, 15.—Authorizing C.N. Ontario Ry. to cross eight highways in Ross and Westmeath tps., and to cross Nicholas Creek, Marlborough tp.

16782, 16783. June 17, 13.—Authorizing Canadian Northern Ry. to cross with its Alsask southerly extension, 13 highways, and with its Swift Current extension, six highways in Saskatchewan.

16784. June 8.—Approving British Yukon Ry. bylaw 12, authorizing O. L. Dickenson, President, to prepare and issue tariffs.

16785. June 15.—Approving clearances for Vancouver, Victoria and Eastern Ry. dock and warehouse at Burrard Inlet, B.C.

16786. June 14.—Authorizing Toronto, Hamilton and Buffalo Ry. to build spur for G. Frid Co., Hamilton, Ont.

16787. June 10.—Authorizing Vancouver-Nanaimo Coal Co. to use bridge across Esquimalt and Nanaimo Ry., Mountain district, Vancouver Island, B.C.

16788, 16789, June 15.—Authorizing C.P.R. to build spurs for Gorman, Clancy and Grindley, Edmonton, Alta., and O. Lemaire, Cabane Ronde, Que.

16790. June 10.—Authorizing C.P.R. to change location of tracks and make alterations in bridges across Mountain, Aqueduct and Guy Sts., Montreal.

16791. June 13.—Authorizing G.T.R. to build siding for Dominion Cannery, Simcoe, Ont.

16792. June 15.—Authorizing C.N. Ontario Ry. to cross McCawley's Creek, Nepean tp.

16793. June 17.—Authorizing Canadian Northern Ry. to build bridge on land of T. Tall, Rosebud Creek, Alta., within 30 days.

16794. June 17.—Amending order 16061, Mar. 2, re newspaper rates from Winnipeg to Calgary, by striking out "minimum charge 10c." at end of par. 2 of clause (b), to points not over 300 miles distant.

16795. June 19.—Appointing F. Blois, mayor, New Carlisle, Que., and D. W. Mill, Q. L.S., as arbitrators between Quebec Oriental Ry. and L. J. Riopel, re payment for lands.

16796. June 18.—Authorizing Essex Terminal Ry. to open for freight traffic its line through Windsor, Sandwich West tp., and Sandwich, Ont.

16797. June 18.—Amending order 16706, June 5, which authorized Peterboro Radial Ry. to cross C.P.R. and G.T.R. at Park St., Peterboro', Ont.

16798. June 19.—Extending to Oct. 31, time for completion by Toronto Eastern Ry. of spur to Durham Rubber Co., Bowmanville, Ont.

Great Northern Railway Lines in Canada.

Port Arthur and Fort William, Ont.—Press reports are again current that the company has survey parties in the field locating lines to Port Arthur and Fort William, Ont., from the International boundary.

Brandon, Saskatchewan and Hudson Bay Ry.—The Board of Railway Commissioners has directed the company to build transfer tracks to connect with the Canadian Northern Ry. at Minto, Man.

Montana-Swift Current-Edmonton—A press report from Swift Current, Sask., states that G.N.R. engineers are making

a survey for a line from the International boundary, north of Plentywood, Mont., passing through Swift Current, to Edmonton, Alta.

Vancouver, Victoria and Eastern Ry. and Navigation Co.—L. W. Hill, Chairman, G.N.R., on the occasion of his recent visit to Vancouver, B.C., is reported to have stated that the construction of the line across the Hope Mountains would be started just as soon as the question of the route had been disposed of by the Board of Railway Commissioners. The company was ready to build its own line, or to work jointly with the Kettle Valley Lines.

It is reported that the company proposes to establish car shops in the vicinity of Coquitlam, B.C. A new station is to be built at once at New Westminster.

Vancouver Terminals.—J. D. Mason, Chicago, Ill., and A. Stewart, of the G.N.R. engineering staff, Seattle, Wash., were in Vancouver, early in June, looking over the work in progress at the site of the new terminals, False Creek.

The work is being pushed along rapidly, and L. W. Hill is reported to have stated on his recent visit that as soon as sufficient filling had been done on the site of the proposed union station near the foot of Park Lane, the building of the station would be started, and that the cost of the building would be over \$500,000.

Victoria and Sidney Ry.—L. W. Hill had an interview with the Premier at Victoria, B.C., June 7, at which it is reported that the question of the sale of the V. and S. Ry. to the Canadian Northern Pacific Ry. was discussed. (June, pg. 296.)

The Central Railway of Canada's Bond Issue.

At a recent meeting of bondholders of the Central Ry. of Canada, in London, Eng., called to deal with the proposed release of the land grant subsidy comprised in the trust deed from the security on the bonds being converted into bonds guaranteed by the Dominion, Ontario or Quebec governments; and the modification of the conditions under which the proceeds of the bonds are to be applied by the trustees, C. N. Armstrong, who presided, stated that owing to there not being a quorum present, no business could be done. He said that the whole object of the company was to get the bondholders' opinion as to whether they would prefer to get the bonds guaranteed by the Dominion Government or get what was expected in place of the bonds they now held. Ninety-five per cent. of those he had been able to see, or those he had heard from, were entirely in favor of exchanging the bond, worth, say 95%, for a bond which would be worth at least par. There were only four bondholders who would prefer to stick to their land. Members of the Stock Exchange only represented about 5% of the bondholders. The total amount of debentures issued was £600,000, and the balance of £400,000 was all ready to be taken up on certain conditions. The cash in hand was about £125,000, and there were ample funds to carry on the whole of the work to be done this year, which was going on satisfactorily. He gave a history of the original land grant, and read an opinion by Sir Charles Cripps, K.C., as to its validity.

The C.P.R. put in operation June 2, a solid sleeping car train between Winnipeg and Calgary. It runs an hour ahead of the regular trains between these cities.

J. G. Scott, ex-General Manager, Quebec and Lake St. John Ry., in remitting his renewal subscription, says: "The Railway and Marine World is the best value for \$1 that I know of."

Dominion Government Railway to Hudson Bay.

Hon. R. Rogers, Minister of the Interior, speaking at Regina, Sask., June 11, is reported to have said that much progress was being made with surveys, and he hoped that the Government would be in a position to call for tenders within 30 or 40 days for the remaining distance to the Bay. If the eastern railway companies, he added, did not make connection with the Government line, the Government itself would build the connections.

An advertisement has since been issued stating that tenders will be received to Aug. 1 for the construction of a section of the line, from Thicket Portage, where the J. D. McArthur contract ends, to Split Lake Jct., 68 miles.

A contract is reported let to E. M. Joyle and Co. for the supply of 170,000 ties for the mileage now under construction.

A party of engineers under H. T. Hazen, it is reported, left Montreal, June 8, for Port Nelson to make surveys in connection with the proposed terminals. (June, pg. 267.)

Protection of Railway Employees in Yards.

The Board of Railway Commissioners has notified railway companies to show cause by July 2 why an order should not be issued as follows:—

Re memorial of Trainmen's Association of Canada for the adoption of certain regulations by the Board, having in view the protection of employees of the railway companies, it is ordered:

Railway companies under the Board's jurisdiction shall file with the Board, on or before Oct. 1, 1912, a statement of its yards, limits of which are indicated by yard limit boards, showing the distance that these boards are located from the outer switches of such yards.

Before any company shall proceed to erect any yard limit board upon its right of way after the date of this order, it must first obtain the Board's approval to the location of such yard limit board.

After Oct. 1, 1912, rule 93 of the approved uniform rules for the operation of Canadian railways shall apply only to yards where locations of yard limit boards have been approved by the Board.

Probable Sale of Temiscouata Railway.

An Ottawa press report states that negotiations are in progress for the acquiring by the C.P.R. of the Temiscouata Ry., which is owned by the same interests in England, from whom the C.P.R. recently acquired the Quebec Central Ry.

The Temiscouata Ry. runs from Riviere du Loup, Que., on the Intercolonial Ry., to Connors, N.B., 113 miles. It connects at Edmundston, N.B., with the C.P.R. branch line from St. John, along the St. John River Valley, via Fredericton.

The Longest Metal Shaving.—A United States technical paper recently claimed that the longest metal shaving had been produced in the U.S., measuring 155 ft. A previous one produced by the same machinist measured 121 ft., while the best previous record ever reported was from the Santa Fe Ry. shops at Topeka, where a shaving of 110 ft. was turned out. These "records" were beaten before they were made, as there has been on exhibit for several years, in the museum attached to the Belle Vue Zoological Gardens, Manchester, Eng., a steel turning, 166 ft. long, taken from a 68 ton gun, at the works of Sir Joseph Whitworth and Co., Manchester.

Traffic Department Established by the Toronto Board of Trade.

The Toronto Board of Trade has established a traffic department under the supervision of its railway and transportation committee, and has appointed as Manager, T. Marshall, heretofore Chairman, Canadian Freight Association Eastern Lines.

A report from a special committee of the board's executive, submitting an outline of the work to be done by the traffic department, says it will embrace the adjustment of freight and express, the provision of facilities for freight handling, convenient train service, commutation and excursion rates. The department will keep on file a complete set of freight, passenger and express tariffs for the information of members.

Mr. Marshall entered railway service, Aug., 1882, since when he has been, to March, 1883, operator, Northern and North Western Ry., Elmdale, Ont.; Apr., 1883, to Dec. 1885, operator and ticket agent, same road, Allandale, Ont.; Jan., 1886, to Sept., 1887, relieving agent, same road; Mar., 1887, to June, 1889, chief clerk, Traffic Manager's office. Lake Erie and Detroit River Ry., Walkerville, Ont.; July, 1889, to Nov., 1901, Assistant General Freight and Passenger Agent, same road; Dec., 1901, to Jan., 1904, General Freight Agent, same road; Feb., 1904, to Jan., 1905, General Agent, Pere Marquette Rd., London, Ont.; Jan. to July, 1905, Division Freight Agent, same road, London, Ont., at which latter date he was appointed Secretary-Treasurer, Canadian Freight Association. On May 1, he was appointed Chairman of the Association.

Association of Railway Telegraph Superintendents.

The annual convention of this association was held at New York, June 4-6. Committee reports on various matters were read, and the committees continued. Papers were also read on construction materials and methods, handling of supplies, polarized sounder in telegraphy, telegraph and telephone facilities at St. Louis terminal, telegraph traffic, maintenance of telegraph lines, the portable telephone in railway service, etc.

In the discussion on construction materials and methods, W. J. Camp, Assistant Manager, C.P.R. Telegraphs, Montreal, described in detail the company's practice and experience regarding the size of poles, spacing of wires on cross arms, insulators, underground service, etc. He favored porcelain insulators, and showed samples as used on the C.P.R. He also stated that the company used nothing but tile conduit for underground service, and that the Board of allway Commissioners required the use of double cross arms at crossings.

A letter was read from J. Kent, Manager, C.P.R. Telegraphs, giving an account of an experience in the use of dry batteries at Sudbury, Ont., during a flood which submerged the storage battery.

Among Canadians present in addition to Mr. Camp, were: T. Rodger, Inspector of Telephones, G.T.R., and A. Dwight Smith, Northern Electric and Manufacturing Co., Montreal; W. Marshall, Superintendent, and G. T. Rooke, Inspector of Transportation, C.P.R. Telegraphs, Toronto.

Telegraph and Cable Matters.

E. A. Stainton, night chief operator, Great North West Telegraph Co., Montreal, was presented with an electric reading lamp, by the operating staff, recently, on leaving the service.

W. F. Ryan, who has been connected with C.P.R. Telegraph service for 25 years, latterly as Assistant Manager of the Montreal office, resigned recently on his appointment as Secretary of the National Bond Co., Montreal.

The Boundary Creek Telegraph and Telephone Co. has been notified that it will be struck off the B.C. Companies register, unless cause be shown to the contrary, for failure to comply with the regulations as required by the Companies Act.

The Minister of Trade and Commerce, who is visiting England, will probably discuss the question of linking up the various islands comprising the British West Indies, by cable, following out the suggestions of the Dominion and West Indies delegates at the recent trade conference at Ottawa.

The Board of Railway Commissioners has further extended, to Dec. 1, the tariffs of telegraph tolls of the C.P.R., White Pass and Yukon Ry., and the G.T. Pacific, Canadian Northern, Great North West and North American Telegraph Cos., which have been authorized by previous orders, and 7 and 8, Ed. VII., chap. 61.

The Western Union Telegraph Co. has announced that it has entered into an agreement with the Marconi Wireless Telegraph Co., for general interchange of business to and from Europe. The agreement also provides for the extension of the service from the Pacific coast to Hawaii, China, Japan and the Philippine Islands.

The Toronto board of control has recommended that the city solicitor apply to the Board of Railway Commissioners for an order to compel all Dominion companies having overhead wires in Toronto, to place them underground in accordance with the Dominion acts. It was also suggested that a conference should be arranged between the authorities and the companies concerned, with a view to abolishing overhead wires.

The installation of the Dominion Government telegraph line between Vancouver and Powell River, B.C., is in progress. The line will run from North Vancouver to Point Atkinson and from there to Howe Sound. Several of the sections will necessitate the use of a cable, and it is expected that the work will be completed by August. The branch line from 150-mile House to Bella Coola, across the Chilcote country, is being pushed forward.

The Board of Railway Commissioners recently dismissed the application of Canadian Press, Ltd., requiring the Great North West Telegraph Co., and the Western Union Telegraph Co., to provide special tolls for press service, similar to those provided by the C.P.R., and ordered the C.P.R., the Great North West and Western Union Telegraph Cos. to restore the rate of 25c per 100 words for press specials in the Maritime provinces. This order came into effect June 17.

Work has been recommenced on the extension of the St. Barbe telegraph line, Newfoundland. At the conclusion of last season's operations, the line had reached Griquet, where an office was opened, thus putting in operation 300 miles of line. During the winter, poles were cut and placed along the route from Griquet to Locks Cove in Hare Bay, to which latter point, 45 miles, the line will be completed as soon as possible. From Locks Cove the line is to be continued to Croc and Conche, and possibly to Englee, before the end of the season.

The C.P.R. has opened telegraph offices at Banff Hotel, Beiseker, Cluny, Czar, New Dayton, Parkland, Standard and Tilley, Alta.; Ainsworth, Chilliwack, Clayburn, Craigellachie, Galloway, Nicomen Quarry, Taft, Whonnock and Wy-

cliffe, B.C.; Bergen Station, Tilston Station, Man.; Eau Claire, Grand Valley Station, Jeannettes, Port Burwell and Port McNicoll, Ont.; Chelsea Station, Hebert, Ivry, St. Guillaume and Val Morin, Que.; Aikins, Deviot, Denzil, Dilke, Druid, Forres, Holdfast, Penzance, Regina Beach, Sifton and Simpson, Sask.

At the annual meeting of the Marconi Wireless Telegraph Co., in London, Eng., June 10, the net profits for 1911 were shown to be \$708,585, against \$307,565 for the previous year. A final dividend of 1% on both classes of shares was declared, making 17% for the year on the preference and 20% on the ordinary stock, and for the current year, first interim dividends of 7% on the preference and 10% on the ordinary stock were declared. G. Marconi stated that the amount due to the company from the Canadian company was reduced in 1911 from \$819,330 to \$392,940, but this would probably be increased during the current year, as financial assistance was being given the Canadian company for further development.

Railway and Allied Associations, Clubs, Etc.

The names of persons given below are those of the secretaries.

CANADIAN CAR SERVICE BUREAU, J. E. Duval, 401 St. Nicholas Building, Montreal.

CANADIAN FREIGHT ASSOCIATION (Eastern Lines), T. Marshall, Canadian Express Bldg., Montreal.

CANADIAN FREIGHT ASSOCIATION (Western Lines), W. E. Campbell, 502 Canada Building, Winnipeg.

CANADIAN RAILWAY CLUB, J. Powell, St. Lambert, Que. Meetings at Montreal 2nd Tuesday each month, 8.30 p.m., except June, July and August.

CANADIAN SOCIETY OF CIVIL ENGINEERS, C. H. McLeod, 413 Dorchester St. West, Montreal.

CANADIAN STREET RAILWAY ASSOCIATION, Acton Burrows, 70 Bond Street, Toronto.

CANADIAN TICKET AGENTS' ASSOCIATION, E. de la Hooke, London, Ont.

CENTRAL RAILWAY AND ENGINEERING Club of Canada, C. L. Worth, 409 Union Station, Toronto. Meetings at Toronto 3rd Tuesday each month, except June, July and August.

EASTERN CANADIAN PASSENGER ASSOCIATION, G. H. Webster, 54 Beaver Hall Hill, Montreal.

ENGINEERS' CLUB OF MONTREAL, R. W. H. Smith, 9 Beaver Hall Square, Montreal.

ENGINEERS' CLUB OF TORONTO, R. B. Wolsey, 94 King St. West, Toronto.

NOVA SCOTIA SOCIETY OF ENGINEERS, A. R. McCleave, Halifax, N.S.

QUEBEC TRANSPORTATION CLUB, J. S. Blanchet, Quebec.

WESTERN CANADA RAILWAY CLUB, W. H. Rosevear, 25½ Princess St., Winnipeg. Meetings at Winnipeg 2nd Monday each month except June, July and August.

Dominion Express Company.

J. A. Boswell, Superintendent Eastern Division, retired from active service June 30.

Effective July 1, lines east of Port Arthur will be subdivided as follows:—

Atlantic Division.—All offices in New Brunswick, Nova Scotia and Quebec (except C.P.R. Mattawa and Temiskaming branch). V. G. R. Vickers, Superintendent. Office, Montreal.

Eastern Division.—All offices in Ontario east of Port Arthur, including C.P.R. Mattawa and Temiskaming branch. J. J. Murray, Superintendent. Office, Toronto, Ont. The Southern Division, of which J. J. Murray has been Superintendent, is abolished and offices are now included in Eastern Division.

Electric Railway Department

The Ottawa Electric Railway and its Employees.

The conciliation board, consisting of Judge McDougall, chairman; Travers Lewis, K.C., representing the company, and P. M. Draper, on behalf of the employees, recently appointed under the Industrial Disputes Investigation Act, to hear the complaints of the Ottawa Electric Ry. employees, submitted a unanimous report to the Department of Labor, June 12.

The demands of the men were embodied in the form of an agreement, which they asked to be entered into by the company and the Amalgamated Association of Street and Electric Railway Employees of America, Division 279, and covered the following points—the discussion of questions with a duly accredited committee of the association; the division of runs into regular and relief runs, conforming, as nearly as possible to a 9 hour day; priority of runs according to seniority; preference in leave of absence for employees who are officers of the association for transacting association's business; clothing for conductors and motormen to consist of, full suit, coat, vest and trousers for summer, and for winter, trousers every year

between 6 p.m. and 6 a.m., if required to work all night; time and a half for statutory holidays; 5c an hour increase for all men employed in shop, shed and line work; no discrimination against members of the association; agreement to remain in force to May 1, 1913, and from year to year thereafter, unless changed, each party desiring a change to notify the other 30 days prior to the expiry of each year.

In response to these demands, the company replied to the effect that it declined to enter into an agreement with a union on matters relating to the conduct or management of its business, this reply affecting 14 of the 22 requests involving that principle. Six of the remaining requests were already in force, and the remainder, covering the rates of wages and the hours of work the company stated that it was prepared to discuss with a committee of its motormen and conductors. The conciliation board held 12 sittings, at which the company's side was given by J. E. Hutcheson, Superintendent, and J. D. Fraser, Secretary-Treasurer, and the men's by M. Sinclair, C. Ryan and J. O'Brien. The board's report classified the demands as follows:—(a) increases of pay; (b) hours of work; (c) recognition of the association; (d) other rules and conditions of employment not included in the fore-

much interest in its employees and provides for their comfort and convenience in a very generous manner, and that consequently it has an exceptionally capable and well set up body of men, who provide an excellent public service. Although not convinced of the justice of any advance in wages, T. Ahearn, President, on behalf of the company, ultimately agreed to the proposition in a very generous spirit, thus enabling the board to make a unanimous report.

It was subsequently stated that the employees had accepted the report, with the exception of one of the conditions of employment which prohibits the wearing of any badge or emblem on the uniforms supplied by the company, when on duty. In order to participate in the increased wages they will also have to accept the decision re badges, etc.

The British Columbia Electric Ry. Co.'s Official Organization

The B.C.E.R. Co. with 182.6 miles of line, has much the largest mileage of any electric railway in Canada, the Toronto Ry., including the Toronto and York Radial Ry., coming second with 126.49 miles, and the Montreal Tramways Co. third with 124.26 miles.

British Columbia Electric Ry. Official Organization Chart.

and overcoat every second year, the company to pay full cost for all men over one year service, and half cost for those in the first year; caps and badges to be supplied without charge; the right of appeal, in case of suspension or discharge, to the President in person, or through the officers of the association; running of cars for conveying employees to their work; provision of suitable seats for motormen and conductors on all cars; cleaning of cars to be done by shed men; free transportation at all times on all company's lines; double time for extra work in excess of regular day's schedule; six days to constitute a week's work; canopy switches in all cars over or near controller; time and a half to be paid for working on statutory holidays; permission to post notices of association's meetings on office bulletin board; one year leave of absence in the case of an employee being elected business agent for the employees, to be renewed in case of re-election; wages to be paid as follows:—30c an hour for week days, work to be performed between 6 a.m. and 12 midnight; 32c an hour for Sundays; 34c an hour between 12 midnight and 6 a.m.; for shop, shed and line men, nine hours to constitute a day's work, with one hour off for dinner; time and a half for overtime; double time for Sundays; double time

going, and it was agreed that the items coming within (d) should continue in force, that those under (b) and (c) be waived, and that the following scale of wages take effect July 1, lasting until, at least, July 1, 1914:—

For conductors and motormen—first year, 21½c an hour for week days, 23½c for Sundays; second year, 22½c for week days, 24½c for Sundays; third year, 25c for week days and 27c for Sundays. For shop and line men, an increase of 1½c an hour throughout.

The old rates of pay were as follows—for first year men, 20c an hour week days, 22c Sundays; second year, 23c an hour weekdays, 25c Sundays; third year, 23c an hour weekdays, 25c Sundays; the rates for shop and shed men now range from 22½c to 36c an hour, according to the class of work, and for line men, from 20c to 23c an hour.

The company also agreed, as heretofore, except in cases of personal dishonesty, to meet and treat individual employees, or a committee of such employees, on grievances or disputes which may arise between them and the company.

The report states, that, as mentioned in the report of a like board in 1908, from the observations of this board and statements made at its sittings, it is evident that the Ottawa Electric Ry. takes

The B.C.E.R. operates three city railways in Vancouver, New Westminster and Victoria. It has alternative inter-urban lines between Vancouver and New Westminster, the longest suburban line in Canada, between Vancouver and Chilliwack, 64 miles, and several other suburban lines in the vicinity of Vancouver, New Westminster and Victoria. It also carries on a large lighting and power business, and has invested a tremendous amount of British capital in a magnificent system, including some remarkable water power developments.

Necessarily, on account of its varied interests and the territory covered by its activities, it has a large official organization, the arrangement of which cannot fail to be of interest to electric railway officials generally, and we therefore give herewith a chart of the organization, for which we are indebted to R. H. Sperling, General Manager.

The Canadian Electrical Association's 22nd annual convention was held at Ottawa, June 19-21.

The action of the Winnipeg Electric Ry. against the city of Winnipeg, to obtain an order for the removal of the city poles and overhead wires, where they are in proximity to the company's system, and for relief on other points, came before the court June 10.

The Quebec Railway, Light and Power Co's New Car Shed and Repair Shops.

To meet the requirements of the increasing rolling stock which needed greatly increased accommodation, the Quebec Railway, Light and Power Co. has built an addition to its car storage shed at St. Sauveur, a suburb of Quebec city, in the lower part of the town near the St. Charles River. For some years the company has had a storage shed on the site of the present structure, where the summer cars were stored in winter, and vice versa; the shed was used for no other purpose, being closed for the season on the storage of the particular series of cars that were not required. The car sheds in the upper part of the town, where the cars in daily service were stored and where the car repair shops were also located, were rapidly overcrowding, and in addition, the repair shop facilities were not of the best under the cramped conditions that prevailed, the heavier repairs being confined to one corner of the car shed, with the lighter repairs removed to the more spacious basement, where a number of the machine tools were located.

On the decision to remove the repair shop and to increase the daily storage space, attention was turned to the old storage shed in the lower part of the town, especially as it was not advantageous to have to bring all the rolling stock up on to the hill each night, as the heavy traffic in the morning and evening hours is in the lower part of the town, where the working classes reside. In consequence, the old storage shops were taken as a base and a new

new wall partitioning off the central shops, similar columns to those in the outside wall are employed.

Parallel with the top wall of the old section of the shops there is a wall running nearly all the way down that side of the shed, dividing off a third of the shop. The front section of the divided off portion, 14½ ft. in length, is used for a paint shop, the car entrance being from the front of the building. To the rear of this large room the general and private lavatories are located. Back of this is the store room communicating with the clerks' room to the rear. The room furthest to the rear is the rest room for conductors and motormen. Other than the addition of these dividing walls, the old shop is the same as formerly.

The various shops in the new addition are midway between the storage tracks in both the old and new parts, along the centre of the complete building, with doors communicating with both parts. This provides a flexible arrangement that may be increased in the future by the addition of further tracks along the lower wall. Beginning at the front end, the four repair shops are in the order given, all 25 ft. 2 in. wide; carpenter shop with track down centre, 66½ ft. deep; electric winding shop, 60 ft. deep; machine shop, 60 ft. deep; and blacksmith shop, 30 ft. deep. Behind this there is a sand room 11 ft. 2 ins. deep, adjoining a 45 ft. heating fan room containing a complete heating installation. To the rear of this are the boilers in a

40 ft. room with a 16 ft. coal bin at the extreme rear.

This heating apparatus is of the hot air blast type, the air passing through heating coils and by means of fans the air is distributed to shop by pipes, ventilators being placed along these at convenient places to ensure a regular heating of the shops and sheds.

In the various shops the machinery and equipment from the upper town shops is installed, along with considerable new machinery, that make the shops in every sense an up-to-date repair plant to handle all the repairs of the city section of the company's lines. The new machinery installed is as follows:—Carpenter shop, circular and band saws, wood lathe and a wood planer; electric winding shop, armature banding machine; machine shop, new shafting and belting, air compressor with long hose for cleaning cars; and blacksmith shop, new forge and blower, anvil and water tank.

The sheds are not located on a regular car line, but are about two blocks distant, connecting with a through line by means of a single track loop, which leads into the sheds from the left end, the cars passing out through the other end, a track on another street leading to the through line. The entrance to the shed are through rolling metal doors, which roll up into a cage over each.

The completed shops are now in service and will help in the handling of the heavy summer traffic that comes to such a historic old town as Quebec.

Lead Hammer Mould at Halifax Electric Tramway Co.'s Shops.

The use of a lead hammer on an assembling job where parts that are more or less completely finished are to be handled, is almost an absolutely indispensable tool. It will be found in the majority of repair shops, whether they be on steam or electric lines.

At the Halifax Electric Tramway Co.'s shops, D. B. Logan, Foreman Machinist, has made up a simple mould for casting these hammer heads. As all who have had occasion to use them know their life is very short, requiring frequent replacing. The construction of the mould is shown in the accompanying illustration. The body of the hammer head is made in the form of a double frustum of a cone, tapering from the centre towards the ends as the sketch of the completed hammer indicates. In consequence, the mould is made in two sections, each

Mould for Casting Lead Hammer Heads.

part containing the form for an end, the taper allowing for the draw. A recessed ring at the centre in the upper face of the lower section, receives a corresponding protecting ring on the lower face of the upper mould form, aligning the two sections. An arbor, contained half in each contact face of the two parts, leaves a hole through the centre of the cast head the shape of a standard hammer handle end. The mould, held together in the position shown, is poured from a gate in the upper end, a small settling space being left in the upper end for shrinkage.

The hammer thus made is simple in construction and at the same time it is quite shapely. It is ready for removal shortly after pouring, so that several may be made up with one heat of lead, with little intervening loss of time from delay in cooling. The steel body of the mould forms a very good heat absorbing medium for quickly cooling the hammer head in the mould.

Sunday Operation on the London and Lake Erie Railway.

At the Toronto Assizes, June 4, the Chancellor heard the case of W. Kerley, of St. Thomas, Ont., against the London and Lake Erie Ry, claiming three penalties of \$400 each for operating the line on three Sundays in Dec., 1911, or, as an alternative, an order to restrain the railway from operating on Sunday, the case having been entered by the Ontario Railway and Municipal Board's consent.

The plaintiff relied on the section of the Ontario Railway Act which provides that "no company operating an electric railway shall operate the same or employ any person thereon on the first day of the week, commonly called Sunday, except for the purpose of keeping the

track clear of snow or ice or for the purpose of doing other work of necessity."

Counsel for defendants repudiate the jurisdiction of the Province, claiming that the company was incorporated by the Dominion Parliament, that the line is run in conjunction with the G.T.R. and other transportation companies, and is amenable only to the Dominion. It is also claimed that, as the late J. P. Mabey, sitting as chairman of the Board of Railway Commissioners, refused to adjudicate or authorize action, the court has no jurisdiction.

Defendant also relies on that part of the Railway Act which gives exemption to a system running in a continuous line between points in different provinces or to a foreign country or which lies between ports on the great lakes.

Chancellor Boyd gave judgment, June 25, as follows:—The simple question here is whether the defendants are liable to pay penalties for running their cars on Sunday. The answer is far from simple and involves difficulties in the application of constitutional law not covered by previous authority. I find as facts that the road has always been strictly a local concern with no such connection as would constitute it part of a continuous route or system and that the traffic of the company was in no sense through traffic within the meaning of the Dominion Railway Act, 1906, c. 37, s. 9, so that the road as operated at the time of the alleged offences was not within any of the exceptions expressed in such section of the Dominion Railway Act; wherefore the net result is that the defendant company, though it be an undertaking which has been declared to be for the public benefit of Canada, is not by virtue of the Canada Railway Act, and the proclamation of December, 1906, subject to section 193 of the Ontario Railway Act, which prohibits the operation of electric railway cars on Sunday. The Parliament of Canada by the agency of the Governor General in Council undertakes to confirm any act of the Ontario Legislature within the legislative authority of the province, etc. In the present case the Parliament of Canada has ratified and confirmed sec. 193 of the Ontario Railway Act and made it as valid and effectual as if it had been enacted by the Parliament of Canada. This law is not, therefore, a general law, extending to the public at large, and all classes and conditions of men, but to a corporate body over which the local legislature has inherently or by delegation from the Dominion legislation plenary power as to its control, governance and operation. The late decision of the Supreme Court on Sunday law is not in point for the present case. It is distinguishable both because it purports to be a general law framed for all persons, and the case did not involve the question of local corporations over which the province has constitutional power and competence. The legislation is not to be regarded as a section of the criminal law of Canada, but as a particular penal law intended for the regulation of local electric railways within the province. So viewed I would uphold the impeached legislation as intra vires and would award to the plaintiff the penalties claimed. There should be no exemption as to the day on which the mail was carried. The cars were not run for the purpose of carrying the mail, but the mail was carried as a favor because the cars ran that Sunday. Costs to plaintiff.

It is said that the case will be appealed.

The Berlin and Waterloo Electric Ry has decided to furnish its motormen and conductors with new uniforms, and has increased their pay to the following scale:—For first six months, 16c an hour; second six months, 17c; second year, 17½c; third year, 19½c; fourth year, 20½c.

An Unsuccessful Roadbed Experiment at Moncton N.B.

In The Railway and Marine World for Nov., 1911, reference was made to a departure in roadbed construction adopted by the Moncton Tramways, Electricity and Gas Co., which the engineer believed would eliminate difficulty from frost.

The accompanying illustration shows the method adopted: The street was trenched to a depth of 15 ins. Two

Tracklaying on Moncton Tramways, Electricity and Gas Co.'s Line.

inch creosoted planks were laid in this trench, and 6 x 8 ins. x 8 ft. ties were then placed with 2 ft. centres, on which were spiked the rails, 6 ins. grooved and 2 ins. of concrete poured between ties, i.e., on planking. The track was then filled in with gravel and rails were lined up. The present track was completed in November last. We are advised that this spring it was found that the frost had heaved the track work to a considerable extent, and the presence of the planking made the work of lining up the track more difficult than had the ties been laid directly on the ground.

London and Lake Erie Railway Co's Car Barns.

In connection with the information as to these new barns at St. Thomas, Ont., contained in our last issue, we are advised that the boiler and coal storage room will be under the inspector's office and conductor's room. The floor of the west half of the building will be flush with the rails, and this section will be used only for car storage. The operating pits are located in the east half adjacent to the machine shop, etc. The barn will have accommodation for 16 of the company's 50 ft. cars. The building, as well as the freight house and substation, which are located about 20 ft. to the west, will be heated by steam from one boiler. The whole of the equipment will be thoroughly modern.

S. D. Egan, of Toronto, is reported to have been appointed Superintendent of the municipal street railway of Regina, Sask.

Change of Control of International Traction Co.

With the completion of the purchase of \$5,000,000 of the common stock of the International Traction Co. of Buffalo, N.Y., that property becomes one of a group of operating public utility corporations controlled by a central holding organization. The United Gas and Electric Corporation, which has been organized under the laws of Connecticut by Bertron, Griscom and Jenks, of New York, although not securing a majority of the stock of the International Traction Co., has bought half of the common stock, leaving the \$5,000,000 of preferred stock outstanding. This ownership of stock, of course, is large enough to dominate the property and to direct its operation in accordance with the general plan followed by the other subsidiary properties of the new holding organization. Among the properties that will be included in the control of the group are, in addition to the International system, a number of lighting and power companies, the Susquehanna Ry. and Light Co., the Elmira Water, Light and Rd. Co., and the Lancaster County Ry. and Light Co., which controls the Conestoga Traction Co. and other properties. The principal lines of urban and interurban railways are owned and operated by the International Ry. Co., which also owns the capital stock of several other small operating companies. The entire capital stock of the International Ry. is owned by the International Traction Co. About one-half of the common stock of the International Traction Co. has been owned heretofore by the Tracational Company, a New Jersey holding company. It is this stock which is understood now to have been acquired by the United Gas and Electric Corporation.

The International Traction Co. controls the Niagara Falls Park and River Ry. between Queenston, Niagara Falls and Chippewa, Ont.

Rumored Sale of Dominion Power and Transmission Company.

It was stated in Hamilton, Ont., June 25, that the Mackenzie, Mann and Co. interests had secured control of the Dominion Power and Transmission Co., which, in addition to controlling the Cataract Power Co., which generates electric power at De Cew Falls, near St. Catharines, and transmits it to Hamilton, etc., also controls the Cataract Power Co.'s various subsidiary companies and other companies generating and transmitting electric energy and operating electric railways, including the Hamilton St. Ry., the Hamilton Radial Ry., the Hamilton and Dundas Ry., the Hamilton, Grimsby and Beamsville Ry. and the Hamilton and Brantford Ry.

The President of the Dominion P. and T. Co., J. R. Moodie, according to press reports, admitted that negotiations were in progress and said that a directors' meeting would be held June 26.

The Dominion P. and T. Co. has the following capitalization:—Bonds, \$6,488,000 preference stock, \$3,673,100; limited preference stock, \$5,100,000; common stock, \$2,608,000.

Installation of Manually Operated Signal System.

The Indianapolis and Cincinnati Traction Co. has just put into service a manually operated, remotely controlled interlocking signal system designed by P. J. Simmen and installed by Northey-

Plummer, Ltd., Toronto, Ont., and Indianapolis, Ind. This system affords means by which the dispatcher as a train approaches, passes or leaves a siding can display stop or proceed signals to the motorman. These signals are displayed by red and green lamps inside the cab, placed directly in the motorman's view. The signal-transmitting apparatus is interlocked so that it is mechanically and electrically impossible for the dispatcher to give signals corresponding to a lap order. Another strong feature of this system is that a permanent graphic record is continually being made in front of the dispatcher, showing at all times the position and direction of movement of all trains. This system of signalling has been in satisfactory operation for some time past on the Toronto and York Radial Ry.'s Mimico Division between Toronto and Port Credit, and has given excellent results.

The Indianapolis and Cincinnati Traction Co. installation includes protection for nine blocks and ten sidings, each block extending from siding to siding and averaging about two miles in length.

Electric Railway Finance, Meetings, Etc.

British Columbia Electric Ry.—Gross earnings for April, \$476,058; operating expenses, \$302,135; net operating earnings, \$173,923; renewal funds, \$37,935; net earnings, \$135,988; approximate income from investments, \$25,000; net income, \$160,988, against \$368,233 gross earnings; \$243,097 operating expenses; \$125,136 net operating earnings; \$29,770 renewal funds; \$95,366 net earnings; \$20,000 approximate income from investments; \$115,366 net income for April, 1911. Aggregate gross earnings for ten months ended Apr. 30, \$4,759,517; net earnings, \$1,671,408, against \$3,440,733 aggregate gross earnings; \$1,336,479 net earnings for same period 1910-11.

Calgary Municipal Ry.—Passenger earnings for May, \$48,467.86; miscellaneous earnings, \$636.60; total earnings, \$49,104.46; operating expenses, maintenance, etc., \$26,250.91; net earnings, \$22,853.55; contingent account, 5% gross receipts, \$2,455.22; interest and sinking fund, \$5,263.33; net profits, \$15,135, against \$28,293.40 passenger earnings; \$438.25 miscellaneous earnings; \$28,731.65 total earnings; \$13,568.35 operating expenses, maintenance, etc.; \$1,436.58 contingent account; \$2,715.88 interest and sinking fund; \$11,010.84 net profit for May, 1911. The revenue per car mile for May was 31.403c; operating expenses per car mile, 16.787c; gross surplus per car mile, 14.616c; cost of power per car mile, 4.651c.

Cape Breton Electric Co.—Gross earnings for April, \$26,558.86; operating expenses and taxes, \$16,064; net earnings, \$10,494.86; interest charges, \$4,495.83; balance, \$5,999.03; sinking and improvement funds, \$1,206.67; balance for reserves, etc., \$4,792.36, against \$23,331.50 gross earnings; \$12,810.47 operating expenses and taxes; \$10,521.03 net earnings; \$4,512.50 interest charges; \$6,008.53 balance; \$1,141.67 sinking and improvement funds; \$4,866.86 balance for reserves, etc., for April, 1911. The construction charges during April were \$4,528.06.

Grand Valley Ry.—The Trust and Guarantee Co., Toronto, are in charge of the affairs of this company, and its allied company, the Brantford St. Ry., and certain legal proceedings have been taken to secure the interests of bondholders. The National Trust Co., Toronto, is seeking to secure a sale of the Brantford St. Ry. in order to settle with the Canadian General Electric Co., which holds \$140,000, the original bonded indebtedness of the company. Nothing has been said of the position of the Woodstock, Thames Valley and Inger-

soll Electric Ry., which is owned by the same interests.

Halifax Electric Tramway.—The regular quarterly dividend of 2% will be paid on and after July 1, to shareholders of record at the close of business June 19.

Receipts for March, \$17,995.42; April, \$17,585.96; May, \$18,678.30, against \$16,129.49 for March, \$17,285.67 for April, and \$17,158.82 for May, 1911.

London St. Ry.—Gross earnings for May, \$24,620.46; expenses, \$18,371.45; net earnings, \$6,249.01; deductions, \$2,450; net income, \$3,799.01. Aggregate gross earnings for five months ended May 31, \$116,053.02; expenses, \$83,749.70; net earnings, \$32,303.23; deductions, \$11,997.25; net income, \$20,305.98.

Nelson St. Ry.—The city council of Nelson, B.C., decided, June 3, to acquire the street railway from the present company, buying out the shareholders in 20 years. It was reported by the City Auditor that the company was \$16,000 in debt, and that there was a present loss of \$4,000 a year.

Toronto Ry., Toronto and York Radial Ry., Toronto Power Co., Etc.—Gross earnings for April, \$658,174; operating expenses, \$296,286; net earnings, \$361,888, against \$576,685 gross earnings; \$293,080 operating expenses; \$283,695 net earnings for April, 1911. Aggregate gross earnings for four months ended Apr. 30, \$2,622,723; net earnings, \$1,345,987, against \$2,311,821 aggregate gross earnings; \$1,153,462 net earnings for same period, 1911. The traffic receipts of the Toronto Ry. for May were \$446,371, against \$406,884.92 for May, 1911. The company has forwarded a cheque to the city for \$89,724.20, as its percentage of the receipts for May, the amount for May, 1911, being \$81,376.99.

Winnipeg Electric Ry.—Gross earnings for April, \$292,037; operating expenses, \$152,938; net earnings, \$139,099, against \$308,113 gross earnings; \$148,096 operating expenses; \$160,017 net earnings for April, 1911. Aggregate gross earnings for four months ended Apr. 30, \$1,209,577; net earnings, \$554,437, against \$1,280,472 aggregate gross earnings; \$615,367 net earnings for same period 1911.

With reference to the negotiations for the sale of the property to a New York syndicate, as noted in our last issue, it was rumored in Winnipeg, during June, that the sale to the syndicate, of which E. B. Reese is the head, has been concluded, but no confirmation has been made. It is stated that the decision of the city in agreeing to come under the jurisdiction of the Public Utility Commission, so far as its light and power plant is concerned, has cleared the air considerably. The rumor also declares that the syndicate had a \$500,000 option on the property before the company commenced negotiations with the city some time ago, and that the price paid is in the neighborhood of \$25,000,000.

Electric Railway Notes.

W. T. Woodroffe, who was formerly in the British Columbia Electric Ry. service, has been appointed Superintendent of the municipal street railway at Edmonton, Alta.

The Grand Valley Ry. has not been running its cars into Galt, Ont., for some months, and the Galt city council is considering the advisability of cancelling the franchise.

The Calgary, Alta., city council has under consideration a proposition for the abolition of transfers and the reduction of fares to 2½ cents, on its municipal electric railway.

The Port Arthur, Ont., city council, at a meeting, June 5, authorized the street railway commissioner to call for

tenders for two pay-as-you-enter cars, for delivery as soon as possible.

The Niagara, St. Catharines and Toronto Ry. is building an electric locomotive, with a weight of 33 tons, 36 ft. long over platform, with steel under framing and steel cab. The cab is to be 29 ft. long over all, length of operating room in cab 9 ft., height of cab, 10 ft., equipped with four Westinghouse 119 motors, Westinghouse straight and automatic air brakes for train control. The locomotive is of the electrical control type, 161 contactors and C-74-A master controller. The new locomotive is to be practically a duplicate of the last one, which was built at St. Catharines last year, this making six locomotives in use on the line.

The following companies have been notified that they will be struck off the British Columbia Companies register, unless they show cause to the contrary, for failure to comply with the regulations required by the act:—Vancouver Street Ry.; Vancouver Electric Ry. and Light Co.; Vancouver and Lulu Island Electrical Ry. and Improvement Co., incorporated under the Imperial Companies Acts, 1862-69; National Electric Tramway and Lighting Co.; Chilliwack Tramway Co.; Vancouver and Westminster Electric Tramway and Light Co.; Nelson Electric Tramway Co.; Canadian Territories Railways Syndicate, incorporated under the Companies Act, 1890.

In the case of Wood vs. The Grand Valley Ry. and A. J. Pattison, at Toronto, June 7, the plaintiff was awarded \$10,000 damages and costs for breach of contract by the defendants, in not building an extension of the railway to connect the village of St. George with the C.P.R. at Galt, Ont. The plaintiff also claimed repayment of \$10,000 for bonds of the company, and other relief. Justice Middleton, in delivering judgment, said:—"I find on both document and oral evidence that both defendants are liable. The promise for the construction of the road has not been performed, and the only remedy is damages for its breach. If the award is paid, the bonds are to be assigned to the party paying, and any money received by plaintiff on account of the bonds in the meantime, is to be credited on the judgment."

Electric Railway Projects, Construction, Betterments, Etc.

Brandon, Man.—The city council decided, May 22, to take over the project for the building of an electric railway in the city, J. D. McGregor consenting to relinquish the franchise which the council had agreed to give him. The feeling of the ratepayers against the proposed franchise, and the question of the company's position under the Public Utilities Act, were the principal factors in bringing this arrangement about. The council proposes to ask the ratepayers to approve of the raising of \$300,000 for the construction and equipment of the line as a public utility. The City Engineer was instructed to order 100 tons of 70 lb. steel rails and 500 tons of 60 lb. steel rails. The council started work in 1912, grading and preparing the road bed on certain streets in connection with the franchise proposed to be given Mr. McGregor. This work is being continued, and it is hoped to have several miles of line in operation this year.

The bylaw authorizing the expenditure of \$300,000 upon the building of an electric railway in the city as a municipal undertaking was passed June 14. (June, pg. 308.)

British Columbia Electric Ry.—The question of the company's franchises in the various municipalities which are included in what is called Greater Van-

couver, continues to be the subject of considerable discussion between the municipalities, the company and the Provincial Government.

Tracklaying has been completed on the Millside extension, and it was expected to have the line in operation by June 30. It has been arranged to build a second track on the Eberne line, and application has been made to the Board of Railway Commissioners for the approval of plans for the work. Rapid progress is being made on the Highland Park cutoff.

The company is building a line from Port Moody to the Coquitlam dam, upon which it is proposed to use light steam engines. The line will only be used for freight.

A contract has recently been let to C. C. Moore and Co., Seattle, Wash., for the building of a steam auxiliary power plant on Saanich Inlet, Vancouver Island.

The equipment, in addition to a complete steam generating plant, will consist of two Allis-Chalmers turbo-generators, each having a capacity of 2,000 kilowatts, the entire production giving the plant an output equivalent to 6,000 h.p. The B.C.E.R. Co. had already purchased five steam turbo-alternators aggregating over 18,000 from Allis-Chalmers-Bullock, Ltd.

One of the features of the new plant will be the construction of the huge stack, which will be of reinforced concrete and will be 248 ft. high. Its inside diameter at the top will be 11 ft., while the inside diameter at the base will be 18½ ft.

The addition of this plant to the working plants, and the others under construction, will bring the total supply of electrical energy controlled by the company up to 128,000 h.p.

At the Jordan River power plant, the original plans have been extended to make the proposition more ambitious, and the ultimate possibilities of the plant have been placed at 36,000 h.p., instead of 24,000, which was first taken to be the maximum of production. The industrial plans also include the development of power on the Lillooet River and the development of hydro-electric projects at Jones and Chilliwack Lakes, which will advance the total output of electrical energy to over 200,000 h.p.

Galt, Preston and Hespeler St. Ry.—We are officially advised that an extension of the line is under construction to the factory district on the west side of the river in Galt, Ont. (May, pg. 257.)

Halifax Electric Tramway Co.—We are officially advised besides building a second track on the loop line mentioned in our April issue, pg. 196, the company is going to extend its Gottingen St. line about a mile to Yonge St., provided the city widens Cunard St. The company is now about two weeks ahead of its schedule on the second track work, and is waiting on the city to complete the work in other places. In connection with the power equipment, orders have been given for a General Electric Co., 1,500 k.w. turbo generator with 33% over load capacity, this equalling a 2,000 k.w. turbo generator; a Worthington surface condensing outfit, and a 25 k.w. turbine exciter set. This contract calls for a complete installation, also one spare arc board panel for 2,100 lamp circuit and one spare a.c. fender panel.

The construction programme for 1913 is also under consideration. It is proposed to extend the track from Quinpool Road and Oxford St. to the head of the northwest arm, 15 miles. (June, pg. 308.)

Lake Erie and Northern Ry.—J. Muir, President, made the announcement in Brantford, Ont., recently, that \$1,000,000 of the company's bonds had been placed, subject to the subscription locally of \$500,000 of debenture stock. Of this

\$275,000 had been subscribed by H. Cockshutt, J. Marr, L. Harris, J. Sanderson and R. Thompson, and it was proposed to ask the municipalities to subscribe for the balance in the following proportions:—Brantford, \$125,000; Paris, Galt, Simcoe, and Port Dover, \$25,000 each. The men named above, with W. P. Kellett, are directors of the company. The taxpayers of Brantford voted, June 25, on a bylaw to borrow the sum necessary to purchase the debenture stock at 90, the price at which it has been offered. The councils of the other towns have the matter of subscribing for the stock under consideration.

A meeting of shareholders to complete organization and to authorize the issue of first mortgage and other securities has been called to be held in Brantford July 9.

The Board of Railway Commissioners has approved location plans for the line from the Grand River to Colborne St., Brantford. (May, pg. 251.)

London and Lake Erie Ry. and Transportation Co.—In connection with the proposal to build a line from St. Thomas to Port Burwell, via Aylmer, the city of St. Thomas and the municipalities of Yarmouth and Malahide have agreed, provided Aylmer joins them, in guaranteeing the company's bonds for \$15,000 a mile, an amount which the London and Lake Erie Ry. and Transportation Co. will accept. At present Aylmer has offered to guarantee its share of the bonds up to \$10,000 a mile. (June, pg. 309.)

Levis County Ry.—Press reports state that the company is preparing to award contracts to build an extension of 1.5 miles from the present terminus of its St. Romauld line to the site of the bridge under construction over the St. Lawrence. A. K. McCarthy, Levis, Que., is manager.

We were officially advised, June 14, that the extension from the present terminus of the St. Romauld line will be for 1.5 miles, to Garneau's bridge, and that the work was expected to be started at once.

London, Aylmer and North Shore Ry.—The city of London, which owns the London and Port Stanley Ry., has made a suggestion that it would be willing to guarantee the bonds of a company to build a line from London to Port Burwell, via Aylmer, to the amount of \$100,000; to grant running rights over the L. and P.S. Ry., and to provide terminal facilities at the Michigan Central Rd. station in London. The lease of the station by the M.C.R. expires in 1914. It is stated that application will be made for a new charter, and to abandon any efforts to revive the L. A. and N.S. Ry. charter. (June, pg. 309.)

London St. Ry.—Considerable improvements are being made on the lines in London, Ont. Arrangements are being made for the building of second tracks, and the question of the north end extension and that of bricking certain crossings, are being considered. (June, pg. 309.)

Moncton Tramways, Electricity and Gas Co.—We are officially advised that the company is laying a 300 ft. extension to the new I.R.C. shops at Moncton, N.B. No decision has been reached as to other extensions in the city or suburbs.

Moncton Tramways, Electricity and Gas Co.—E. B. Reeson, Vice President, is quoted as stating, June 6, that an early start will be made on projected extensions of the street railway. (June, pg. 309.)

Montreal and Southern Counties Ry.—Considerable progress has been made with the electrification on the line to Chambly, and on the other works which the company is carrying out in St. Lambert, Que. Granby taxpayers on June 15 carried a bylaw granting a 25 year fran-

chise for a line in that city. It is said that the surveys for the Granby St. Cesaire line will be started at once. (June, pg. 309.)

Moose Jaw Electric Ry.—We are officially advised that the land acquired by the company for park purposes is situated about 2.5 miles from the post office in Moose Jaw, Sask. A line is to be built from the corner of Coteau St and Sixth Ave., South Hill, west along Coteau St. to Third Ave., then south, crossing the river and to the park on the southern boundary of sec. 39. It is expected that the development and construction work will be started in the near future. A. H. Dion is manager. (June, pg. 309.)

Nanaimo, B.C.—A resolution was adopted by the Nanaimo, B.C., city council, May 22, granting the right to M. Yates to build an electric railway on the city streets, upon terms to be agreed upon. A vote of the taxpayers will be taken at an early date, and application will be made next session of the Legislature for the incorporation of a company to build the line. (Mar., pg. 148.)

Niagara, St. Catharines and Toronto Ry.—Work was started June 11 on the company's new station and freight sheds at Port Dalhousie, Ont. J. T. Rebstock, President, Welland board of trade, is quoted as stating June 10, that he had been informed by D. B. Hanna, President, N., St. C. and T. Ry., that all financial arrangements had been completed for extending the railway from Port Colborne to Fort Erie, and that the only obstacle in the way of work being started at once was the opposition of certain residents along the route.

Enquiry of the management shows that Mr. Rebstock was either misreported or that he misunderstood what he was told in the interview referred to. It is not considered likely that the extension will be gone on with this year. (June, pg. 309.)

Niagara, Welland and Lake Erie Ry.—We are officially advised that further construction on this line cannot be proceeded with until the plans have been approved by the Board of Railway Commissioners. (June, pg. 309.)

Ottawa and St. Lawrence Ry.—J. A. Morden and Co., Toronto, advise that they have acquired the charter and all assets of the O. and St. L. Ry. and of the North Lanark Ry. They say that the company is being reorganized, but that officers have not yet been appointed; also that surveys have been completed from Ottawa to Arnprior and from Arnprior to Perth, Ont. Negotiations are said to be in progress for financing construction. No contracts have been let. (May, pg. 252.)

Port Arthur and Fort William Electric Ry.—Bylaws have been passed by the taxpayers of Port Arthur, Ont., to provide funds for the purchase of steel rails for Cumberland St. and Fort William road, and to provide iron poles for use on the line. Plans are under consideration for the building of a belt line which will serve the outlying points of the city. (June, pg. 310.)

St. Thomas St. Ry.—The city council of St. Thomas, Ont., has accepted the tender of the Michigan Central Rd for 60 lb. rails at \$26.50 per ton, for the street railway. (June, pg. 310.)

Saskatoon Electric Ry. and Power Co.—The taxpayers voted June 18 on a bylaw authorizing the Saskatoon, Sask., city council to raise \$500,000 on debentures for the construction and equipment of a municipal street railway. (June, pg. 310.)

Stratford St. Ry.—At a special meeting of the Stratford, Ont., city council, May 29, the bylaw granting a franchise to the company was finally settled. The bylaw provides that the company shall

obtain its power from the Hydro-Electric Commission of Ontario, provided that the rates charged by the commission are not greater than can be obtained from other corporations guaranteeing power, or by other means. The city authorities undertake to secure legislative sanction to the amendments made in the bylaw of 1910. It is said that construction will be started at an early date, and that surveys will be made at once for an extension of the line to Grand Bend on Lake Huron. The charter is controlled by Mackenzie, Mann and Co., and J. E. Rothery, Toronto, is in charge of the project. (June, pg. 310.)

Toronto.—The city council passed a resolution, May 28, authorizing the corporation counsel to appoint a permanent railway expert as an official to be attached to his department for street railway traffic purposes, and appropriating \$35,000 for the securing of expert assistance required in connection with transportation matters. This was the recommendation of the board of control, but in passing the council an amendment was added as follows:—"Such expert or experts to be residents of Canada if such can be found satisfactory to the corporation counsel." B. J. Arnold, Chicago, Ill., and J. W. Moyes, Toronto, have been engaged for the purpose. (April, pg. 198.)

Toronto Eastern Ry.—The Board of Railway Commissioners has approved location plans for this projected line through the townships of Whitby and Whitby East. A contract has been let to Ewen Mackenzie, Toronto, for the building of the line from Bowmanville to Toronto, or to some point near Toronto. The route of the line into Toronto has not yet been announced, but it is probable that at first, at least, it will connect with the Canadian Northern Ontario Ry. line outside Toronto. (June, pg. 310.)

Toronto and York Radial Ry.—Surveys are reported to have been made for a line to connect the Scarboro and Metropolitan divisions with the Canadian Northern Ontario Ry. in the Don Valley near where the Toronto Eastern Ry. will connect. This will enable a connection to be made round north Toronto with the Toronto Suburban Ry. in the north west end of the city, which line is owned by the same interests.

The Ontario Railway and Municipal Board, June 17, made an order authorizing the Metropolitan Ry., one of the component companies, to deviate its line from Yonge St. to a private right of way from Farnham Ave. to a new terminal 800 ft. west, and north of the C.P.R. The line will cross several streets on the level, but the speed is not to exceed six miles an hour, the Board holding that it was not reasonable to compel the line, with its small earnings, to spend \$500,000 in grade separation, more especially as the municipalities refused to contribute anything. Very strong objection has developed in Toronto to the Board's order and steps are being taken to upset it. (Mar., pg. 149.)

Toronto Suburban Ry.—Application is being made for permission to build a second track on certain of the lines in West Toronto, and to alter the gauge in others to standard. Construction of the line from Weston to Woodbridge, Ont., is being proceeded with, but nothing had been done to June 18 on the line from Lambton west. Purchasing agents are negotiating for right of way between Islington and Meadowvale. (June, pg. 310.)

Windsor, Essex and Lake Shore Rapid Ry.—Location plans have been approved by the Board of Railway Commissioners for a new siding, freight shed and station at Essex, Ont. (Dec., 1911, pg. 1173.)

Among the Express Companies.

The Canadian Ex. Co. has extended its service on the G.T. Pacific Ry. to Minton, 56 miles west of Edson, Alta. New offices will be established at Bickerdike and Makanum.

The Pacific Parcels Delivery and Express Co., and the White Pass and Yukon Express Co., have been notified that they will be struck off the B.C. Companies register unless cause be shown to the contrary, for failing to comply with the regulations as required by the act.

The Dominion Express Co.'s annual meeting was held at Montreal, June 14, when the report for the past year was presented and the usual dividends declared. The directors for the current year are—President, W. S. Stout; Vice President, R. Paton McLea; Sir Thos. G. Shaughnessy, R. B. Angus, C. R. Hosmer.

The Canadian Northern Ex. Co. commences operating over the Bay of Quinte Ry., July 1, superseding the Dominion Ex. Co. Following is a list of the offices on the line:—Actinolite, Allens, Banockburn, Camden East, Deseronto, Entomprise, Erinsville, Larkins, Marlbank, Moscow, Napanee, Newburgh, Queensboro, Strathcona, Sydenham, Stoco, Tamworth and Yarker, Ont.

The American Ex. Co., which has been operating over the Quebec Central Ry. for the past 15 years, withdrew from the service, June 30, and closed its offices on the line between Quebec and Sherbrooke. The company retains an office at Montreal. The control of the Quebec Central Ry. having passed into the hands of the C.P.R., the Dominion Ex. Co. will in future operate over the line.

The Dominion Ex. Co. advised that it withdrew its service from the Bay of Quinte Ry., June 30, being superseded by the Canadian Northern Ex. Co., the Bay of Quinte Ry. having passed under the control of the C.N.R. Hereafter shipments by Dominion Ex. Co. will be walled to destination through Tweed, Ont., and business from its offices on the Kingston and Pembroke Ry. south of Sharbot Lake will be routed through Harrowsmith, Ont.

The Dominion Ex. Co. advises that on account of the Canadian Northern Ex. Co.'s service not having yet been put into operation over the C.N.R., west of Hawkesbury to and including Ottawa, also west of Port Arthur to North Lake, Ont., shipments for Addie Lake, Cumberland, Cyrville, Evanville, Gravel Lake, Hiawatha Park, Hymers, Jessop Falls, La Framboise, L'Original, Nillalu, Clarence, Orleans, Rideau Jct., Rock Lake, Rockland, Sandstone, Silver Creek, Silver Mountain, Slate River, Stanley Jct., Treadwell, Wall Bridge, Wendover, Whitefish and North Lake, must not be accepted until further advised.

The Dominion Ex. Co. calls the attention of its agents to conditions of carriage 10 of Express Classification 2, covering carriage by two or more companies, providing that unless otherwise specifically stated, where a shipment cannot be carried through to destination by one company and is necessarily carried by two or more companies, each company's charge will be assessed separately and not on the through rate made by combining the locals, except that when the shipment comes within the table of graduated charges, one through charge shall be assessed thereon, as in Condition of Carriage 9. For example, when the local merchandise rates are \$1 and \$2, the scale N rate through is \$2.30, that is, the sum of the local scale N rates, not \$2.10 based on the combined merchandise rate of \$3. This does not apply when a specific minimum charge or a joint through rate is in effect.

Marine Department

The Richelieu and Ontario Navigation Co. Absorbs Three More Steamboat Lines.

Following on its acquisition last year of the Northern Navigation Co., the Richelieu and Ontario Navigation Co. has recently made considerable further progress with its scheme for the absorption of lake vessel lines, by adding the Niagara Navigation Co., the St. Lawrence River Steamboat Co. and the Thousand Island Steamboat Co.

The whole of the Niagara Navigation Co.'s issued stock, \$998,600, out of an authorized issue of \$1,000,000, there being 14 shares in the treasury, was secured before the end of May, all the shareholders having transferred their holdings. A very large majority of them took payment in cash at \$200 a share, the balance taking R. and O.N. stock in exchange at 120, that is five R. and O.N. shares for three Niagara shares. In addition to this the Niagara shareholders received a bonus of \$13.72 for each share held, this being the advance in value of 1981 shares of stock which were taken over some months ago from J. C. Eaton of Toronto, and which he received in part payment for the Hamilton Steamboat Co. and the Turbine Steamship Co.'s properties. In other words, the sale to the R. and O.N. Co. netted the Niagara shareholders \$213.72 per \$100 share. The Niagara Navigation Co. had 4½% debentures outstanding for \$227,000, thus bringing the total purchase price up to \$2,224,200.

The transfer of stock having been effected, the directors of the Niagara Navigation Co., headed by Sir Edmund Osler, retired early in June, the following being elected to succeed them:—Sir Rodolphe Forget, President; W. Wainwright, Vice President; C. J. Smith, Vice President and General Manager; Sir Henry M. Pellatt, W. Manson, G. Caverhill and A. H. Sims. F. Percy Smith, Secretary, R. and O.N. Co., was also appointed Secretary of the Niagara Navigation Co., vice J. M. Sullivan, who has been appointed Assistant Secretary.

B. W. Folger, who has been General Manager of the Niagara Navigation Co. for a number of years, since the retirement of the late John Foy from that position to take the presidency, resigned at the same time as the old board. He has not decided on his future activities, but will probably remain in Toronto for this summer at least.

The St. Lawrence River Steamboat Co. and the Thousand Island Steamboat Co. with headquarters at Kingston, Ont., and Clayton, N.Y., respectively, were owned by a syndicate headed by Sir Edmund Osler, W. D. Matthews and B. W. Folger of Toronto, Robt. Crawford of Kingston being President. The St. Lawrence River Steamboat Co. has a capitalization of \$60,000 and the Thousand Islands Steamboat Co. of \$100,000, in addition to which there is certain bonded indebtedness. The prices paid by the R. and O.N. Co. for these properties have not been made public, but it is generally believed that the syndicate above mentioned, which obtained control a little over a year ago, made a good profit on the sale. The stock of both companies having been purchased by the R. and O.N. Co., Mr. Crawford and his co-directors retired June 11 and the following were elected:

St. Lawrence River Steamboat Co.—President, Sir Rodolphe Forget; Vice President, W. Wainwright; General Manager and General Manager, C. J. Smith; other directors, F. P. Smith, J. V. O'Donahoe.

Thousand Island Steamboat Co.—President, Sir Rodolphe Forget, Vice President, C. J. Smith; other directors, W. Wainwright, A. H. Sims, Montreal; B. L. Jones, H. Parry, Buffalo, N.Y.; F. K. Force, Watertown, N.Y.

F. Percy Smith, Secretary, R. and O.N. Co., was appointed Secretary of both these acquired companies.

At Dec. 31, 1911, the R. and O.N. Co. had capital stock issued for \$5,311,875 and 5% bonds for \$1,233,633.33 outstanding. On May 28 notice was given of the issue of new stock for \$1,908,500, which was offered to shareholders at par, one share of new for each four shares of old held.

The following appointments, etc., have been announced:—

C. J. Smith, as Vice President and General Manager, will have full charge of the properties of the Niagara Navigation Co., the St. Lawrence River Steamboat Co. and the Thousand Island Steamboat Co.

P286 C. J. Smith,
General Manager, Richelieu and Ontario Navigation Co.

gation Co., the St. Lawrence River Steamboat Co. and the Thousand Island Steamboat Co.

H. Foster Chaffee, heretofore Assistant General Passenger Agent, R. and O.N. Co., Toronto, has been appointed General Passenger Agent, R. and O.N. Co. lines west of Prescott, Ont., including Niagara Navigation Co., Thousand Island Steamboat Co., and St. Lawrence River Steamboat Co. Office, Toronto.

The jurisdiction of the following R. and O.N. Co.'s officials has been extended over the Niagara Navigation Co.:—T. Henry, Traffic Manager; H. Foster Chaffee, General Passenger Agent Western Lines; J. Ritchie, General Agent; J. A. Villeneuve, Comptroller and Treasurer; M. Cussen, Auditor Freight and Passenger Receipts; J. V. O'Donahoe, Manager's Assistant; G. Johnston, Mechanical Superintendent; A. Angstrom, Naval Architect; J. Phelan, Assistant to Me-

chanical Superintendent; A. A. Barry, Chief Culinary Steward; J. H. Bouchard, Chief Equipment Steward. The jurisdiction of all these officers except J. Ritchie, has also been extended over the St. Lawrence River Steamboat Co. and Thousand Island Steamboat Co.

Jas. Ritchie, heretofore General Agent, R. and O.N. Co., Toronto, as General Agent representing the General Manager's office, has been given general supervision of the Toronto, Hamilton, Lewiston, Youngstown and Niagara terminals, and the operation of the steamboats and handling of traffic in connection therewith. Officers, agents, captains, engineers, pursers, stewards and employees of the mechanical department report to his office in connection with operation, maintenance, repairs and supplies.

J. V. Foy, heretofore General Passenger Agent, Niagara Navigation Co., has been appointed District Passenger Agent, R. and O.N. Co. Office, Toronto.

R. H. McBride, heretofore Treasurer, Niagara Navigation Co., has been appointed Assistant Treasurer, N.N. Co.

S. J. Murphy, heretofore Travelling Passenger Agent, Niagara Navigation Co., has been appointed Excursion Agent, Niagara Navigation Co. Office, Toronto.

J. A. Goodearle, General Freight Agent, and J. P. McConnell, Assistant Freight Agent, Niagara Navigation Co., Toronto, and W. E. Bishop, General Agent, Niagara Navigation Co., Hamilton, Ont., remain in the same positions.

H. D. Patterson, heretofore Travelling Passenger Agent, R. and O.N. Co., Toronto, has been appointed Travelling Passenger Agent lines west of Prescott, including affiliated lines.

G. Price, ticket agent, R. and O.N. Co., 46 Yonge St., Toronto, has also been appointed ticket agent for the Niagara Navigation Co., and other affiliated lines.

H. E. Weller, heretofore ticket agent, Niagara Navigation Co., 63 Yonge St., Toronto, has been appointed terminal ticket agent, R. and O.N. Co., at the Yonge St. wharf, Toronto. The business heretofore transacted at 63 Yonge St. has been removed to 46 Yonge St.

W. F. Cloney, District Passenger Agent, R. and O.N. Co., Buffalo, N.Y., has also been given jurisdiction over the Niagara Navigation Co.'s line.

The jurisdiction of T. Henry, Traffic Manager, R. and O.N. Co., has been extended over Thousand Island Steamboat Co. and St. Lawrence River Steamboat Co.

H. B. Mills, heretofore General Passenger Agent, St. Lawrence River Steamboat Co. and Thousand Island Steamboat Co. at Kingston, Ont., has been appointed General Agent at Clayton, N.Y.

G. Bowden, heretofore Secretary Treasurer, St. Lawrence River Steamboat Co. and Thousand Island Steamboat Co., has been appointed Assistant Secretary Treasurer of those companies.

J. W. Canvin, District Passenger Agent, R. and O.N. Co., Alexandria Bay, N.Y., has had his jurisdiction extended over the St. Lawrence River Steamboat Co., and the Thousand Island Steamboat Co.

The Niagara Navigation Co.'s general offices in the Traders Bank Building, Toronto, will be retained by the R. and O.N. Co.

With the exception of its ferryboat

Ongiara on the Niagara River, the Niagara Navigation Co. has not operated on Sunday, but the R. and O.N. Co. intends to run its Niagara River Line on that day, commencing July 7. The official notice say "that as a matter of public necessity and in order to provide through service for the travelling public it will establish a Sunday service to and from Toronto connecting with other transportation companies, leaving Toronto at 7.30 and 11 a.m., 2 and 5.15 p.m., connecting with New York Central Lines and Niagara Gorge Rd. for Buffalo, and at Buffalo with all rail and water lines. From Lewiston, N.Y., steamboats will leave at 8 and 10.30 a.m., and 2 and 6 p.m., making through rail and water connections at Toronto."

The R. and O.N. boats on the Prescott-Toronto run have heretofore arrived at and departed from Toronto on Sundays, so that the change above mentioned will merely be an extension of the service through to Lewiston, N.Y. The boats will not call at Niagara-on-the-Lake or Queenston, Ont. The line between Toronto and Olcott, N.Y., will also run on Sundays. There will be no Sunday service between Toronto and Hamilton. On the Toronto-Lewiston and Toronto-Olcott routes passengers will be carried at regular rates only, book tickets will not be honored and there will be no excursion rates.

The combined fleet of the R. and O.N. Co. and the companies which it has acquired is now as follows:—

R. and O.N. Co., 13 steamboats and 18 market line steamboats and ferries.

Northern Navigation Co., 9 steamboats.

Niagara Navigation Co. (including acquired from Hamilton Steamboat Co. and Turbine Steamship Co.), 8 steamboats.

St. Lawrence Steamboat Co., 3 steamboats.

Thousand Islands Steamboat Co., 3 steamboats.

This makes a total fleet of 54.

A large passenger steamboat is being built for the Northern Navigation Co. at Port Arthur. The Thousand Islander, the Thousand Island Steamboat Co.'s new boat, was delivered on June 16 and the R. and O.N. Co. announces that it will build a large ferry for service at Montreal. Some months ago it was announced that the Niagara Navigation Co. had decided to build another boat and that plans were being prepared by F. E. Kirby, of Detroit, Mich. Only some preliminary work was done in this connection, the Niagara Co.'s management dropping the matter in consequence of the negotiations for the sale of the company's interest. The R. and O.N. Co. will probably take this up.

Up to June 20, when this was written, the Island Navigation Co. had not been taken over by the R. and O.N. Co., but we were officially advised that the basis on which it was to be taken over had been approved of.

Dominion Government Hydrographic Steamship for Atlantic Coast.

The specification for the building of a single screw steamship for the hydrographic branch naval service department for use in the Atlantic coast service, tenders for which were received up to June 30, call for a vessel of the following principal dimensions:—Length, over all, 177½ ft.; length, between perpendiculars, 165 ft. beam moulded, 33½ ft.; depth, 13½ ft.; displacement to mean draught of 11 ft., above bottom of keel angles amidships, about 950 tons, with 250 tons of coal on board and 60 tons of stores and water. The vessel and fittings are to conform to all the requirements of the

rules and regulations prescribed by the Dominion Board of Steamboat Inspection, and to equal the requirements of British Lloyds to class 100 A 1.

She is to be built of steel throughout except where otherwise specified, with

P 287 Thomas Henry,
Traffic Manager, Richelieu and Ontario Navigation Co.

straight stem, elliptical stern and two pole masts of wood with necessary sails and rigging; one spar deck of steel covered with wood deck to Lloyds' requirements, the forward end being stiffened

P 288 H. Foster Chaffee,
General Passenger Agent, Western Lines,
Richelieu and Ontario Navigation Co.

from the stem back to the breakwater. The main deck to be plated amidships over the machinery space and bunker, and covered with wood deck; double bottom extending from aft engine room bulkhead to forward bunker bulkhead,

and a water tight flat forward and aft of same, there being six water tight bulkheads extending to main deck; nine hatchways in spar deck, on which deck will be located the deck house and pilot house. The equipment is to include a steam winch with all necessary fair leads for handling boats and warping ship, one steam anchor windlass forward for handling anchors and fitted with gypsy heads for warping ship, one sounding winch, and a sounding machine, which will be provided by the department. The steam steering gear is to consist of a two-cylinder, 4 by 5 in. engine of approved make, operated by means of a telemotor located in the pilot house. Two 27 ft. gasoline launches, each fitted with 15 h.p., or 4-cycle engines, two 27-ft. cutters and one 18-ft dinghy are to be supplied. The electric lighting plant is to consist of a generating set of one steam-turbo generator of steam economy equal to that of a compound engine, or a compound engine, to be directly connected to a generator of not less than 13.2 kw., capable of supplying all lights on the vessel, including a search light at the same time at 110 volts pressure.

The propelling machinery to consist of vertical inverted three cylinder triple expansion engines with cylinders 17½, 27½, and 47½ ins. diam., by 28 ins. stroke, driving a three blade propeller 10 ft. diam. 9 ft. pitch, at about 150 revs. per minute, giving a speed of 12 knots an hour, with steam pressure of 185 lbs. The steam will be supplied by two Scotch boilers, each 11½ ft. long by 11¼ ft. mean diam., fitted with corrugated furnaces, with a combined grate surface of 90 sq. ft., and total heating surface of 2,800 sq. ft., and with forced draught equipment. The auxiliary machinery will include, steam dynamo, one independent bilge pump, one fire pump, one auxiliary feed pump, one main feed pump, one sanitary pump and one 10-ton evaporator and a distiller with capacity for 1,600 gallons in each 24 hours.

Reid Newfoundland Co.'s New Steamship for Canadian Service.

As noted in our last issue, the Reid Newfoundland Co. has ordered in Newcastle, Eng., two steamships, one of which will be operated in the daily service between Port aux Basques and North Sydney, N.S., with the company's new steamship Bruce, replacing the s.s. Invermore, and the other being run in the Labrador service. Both vessels are being built to class 100 A 1 at Lloyds, with special strengthening for ice.

The first vessel, that for the Port aux Basques-North Sydney service, will have accommodation for 78 first and 160 second class passengers, and will have the following dimensions—Length between perpendiculars, 255 ft.; breadth, 37 ft.; depth, moulded to shade deck, 24¾ ft. She has been designed to carry about 800 tons on a 17¼ ft. mean draught, with a speed of 15 knots an hour. She will be equipped with four boilers, 15 ft. diam., by 11½ ft. long, fitted with forced draught, supplying steam at 180 lbs. pressure. The contract calls for delivery by Jan. 31, 1913.

The vessel for the Labrador service will have accommodation for 68 first, and 140 second class passengers, with extra accommodation for 18 persons in hospital. Her dimensions will be, length between perpendiculars, 220 ft.; breadth, 32 ft.; depth moulded, 20½ ft. She will have a speed of 13 knots an hour, and will be equipped with two boilers 13¾ ft. outside diam., by 11 ft. long, fitted with forced draught. The contract calls for delivery by Apr. 15, 1913.

The Board of Railway Commissioners has defined the express collection and delivery limits for Grand Falls, N.B.

The Dominion Canals Statistics for 1911.

The canal statistics of the year 1911 have been issued by the Railways and Canals Department.

The aggregate volume of freight moved through all the canals was 38,030,353 tons, a decrease of 4,960,255 tons from 1910. This is more than accounted for by the decline in traffic at Sault Ste. Marie, applicable almost wholly to United States ore. An increase of 211,339 tons through the Welland canal, and of 344,956 tons through the St. Lawrence canals, would point to satisfactory growth as far as strictly Canadian business was concerned.

The freight traffic was distributed among the various canals as follows:—

	Tons.	Inc.	Dec.
Sault Ste. Marie...	30,951,709		5,443,978
Welland.....	2,537,629	211,339	
St. Lawrence.....	3,105,708	344,956	
Chambly.....	599,829		69,479
St. Peter's.....	75,298		10,653
Murray.....	163,457		14,484
Ottawa.....	320,071		65,190
Rideau.....	172,227	37,346	
Trent.....	57,290	11,027	
St. Andrew's.....	47,135	38,852	

Total..... 38,030,353 643,520 5,603,775

The expansion for the ten year period between 1902 and 1911 was equal to 406%, the tonnage in 1902 having been 7,513,197 tons.

The following comparative statement shows on what canals the growth has taken place during the past four years:—

	1908.	1911.
Sault Ste. Marie.....	12,759,216	30,951,709
Welland.....	1,703,453	2,537,629
St. Lawrence.....	2,009,102	3,105,708
Chambly.....	503,276	599,829
St. Peter's.....	72,015	75,298
Murray.....	25,901	163,457
Ottawa.....	258,527	320,071
Rideau.....	89,640	172,227
Trent.....	81,690	57,290
St. Andrew's.....		47,135

The percentage of traffic in 1911 was as follows:—Vegetable products, 14.2%; animal products, 0.1%; manufactures, 6.2%; produce of forests, 4%; produce of mines, 75.5%.

CANADIAN AND UNITED STATES TRAFFIC.

Prior to 1908 the statistical methods in use did not provide for a separation of Canadian and United States business passing through the canals. Since that date a record has been kept of the country of origin, and the facts with respect to the traffic of all the canals are given in the following statement:—

Year.	Canadian Vessels.		U. S. Vessels.		Freight Tonnage.		
	No.	Tonnage.	No.	Tonnage.	Canadian.	United States.	Total.
1903.....	29,040	6,780,789	7,414	4,835,320	5,012,147	12,490,673	17,502,820
1909.....	22,507	7,811,578	9,906	16,459,322	7,378,057	26,342,691	33,720,748
1910.....	25,337	8,931,790	11,462	21,777,297	7,883,614	35,106,994	42,990,608
1911.....	25,585	9,172,192	10,370	18,231,622	7,792,907	30,237,446	38,030,353

Of all the commodities transported through Canadian canals in 1911, the proportion originating in the U.S. was 79.5%. In 1910 the proportion was 81.6%. This large difference in favor of the U.S. is almost wholly accounted for in the volume of ore passed through the Sault Ste. Marie canal.

With regard to vessel tonnage, the proportions in 1911 stood as follows:—Canadian, 33.5%; United States, 66.5%.

TRANSPORTATION OF CANADIAN WHEAT.

With the development of the western provinces there has been a steady growth in the volume of waterborne wheat. Since 1895 the quantities annually brought down through the Sault Ste. Marie canal are as follows:—

	Bush.
1895.....	4,518,334
1896.....	19,314,234
1897.....	17,925,834
1898.....	9,746,600
1899.....	12,759,634

1900.....	9,292,034
1901.....	9,639,534
1902.....	27,912,500
1903.....	32,233,934
1904.....	29,794,100
1905.....	25,983,100
1906.....	34,339,300
1907.....	49,399,967
1908.....	58,574,034
1909.....	48,047,833
1910.....	51,774,833
1911.....	63,641,000

The figures for the years anterior to 1909 include U.S. wheat. The increase in 1911 over 1909, applicable only to Canadian wheat, was 15,593,167 bush., or 32.4%.

In addition to the 63,641,000 bush. of Canadian wheat which passed through the Canadian canal at Sault Ste. Marie, 1,981,481 bush. of Canadian wheat passed through the U.S. canal there. These figures combined show that the volume of waterborne Canadian wheat in 1911 was 65,622,481 bush. Account is not taken of the relatively small quantity of wheat which was moved through any of the other canals. However, 183,449 barrels of Canadian flour were carried through the Canadian canal at Sault Ste. Marie in 1911, and 841,733 barrels of Canadian flour through the U.S. canal. Calculating this Canadian flour into wheat makes an addition of 4,100,728 bush. to the volume already indicated, bringing the total up to 69,723,209 bush.

Last year, for the first time, a careful study was made of the distribution of Canadian wheat after it had passed through the canal at Sault Ste. Marie, and this year the same analytical methods have been applied to the traffic of 1911. The record is as follows:—

	1909.	1910.	1911.
	Bush.	Bush.	Bush.
Fort William to Montreal.....	10,517,266	13,185,370	12,761,666
Fort William to Georgian bay.....	13,384,400	12,753,200	9,881,234
Fort William to other Canadian ports.....	10,149,633	9,603,400	11,880,666
Fort William to Buffalo.....	12,841,334	15,693,363	27,945,600
Duluth to Montreal.....	520,000	315,000	
Duluth to Buffalo.....	528,200	224,500	710,334
Duluth to Georgian bay.....	28,000		461,500
Duluth to other Can. ports.....	79,000		
Total.....	48,047,833	51,774,833	63,641,000

Total..... 48,047,833 51,774,833 63,641,000

the Canadian wheat which came down in 1911 through the Canadian canal at Sault Ste. Marie clung exclusively to Canadian channels. The proportion in 1910 was 68.6%; so that the diversion to U.S. channels was considerably greater in 1911.

"Of the 63,641,000 bush. of Canadian wheat which were transported through the Canadian canal at Sault Ste. Marie during 1911, 43.8% went to Buffalo, N.Y. Wheat is supposed to follow the channel offering the lowest freight rates, other things being equal. In this instance, however, distance and freight rates were substantially in favor of Montreal; and yet other considerations caused nearly half of the wheat which came down last year from the Canadian west to find its outlet to the ocean through Buffalo.

"The course of the wheat trade during Nov., 1911, may be taken as illustrating the situation. In that month 18,021,300 bush. of Canadian wheat were passed through the Canadian canal at Sault Ste. Marie, or nearly one-third of the total volume for the year. The all-water freight rate from Fort William to Montreal in November was 4½c. per bush. The water rate from Fort William to Buffalo was 3½c. per bush., plus 5½c. by rail from Buffalo to New York. Montreal and New York are the essential points of comparison. Thus in November the freight rate from Fort William to Montreal was 4½c., as compared with 9c. to New York. This would seem to establish a controlling advantage in favor of Montreal, and, other things being equal, it would be; yet in that month 48.3% of all the Canadian wheat which came down from the west, including that which passed through the U.S. canal, went out by way of Buffalo-New York.

"Careful inquiries were made as to the conditions which operated in November last, and which in some degree operate in all seasons, as a counterweight to the lake freight rates in favor of Montreal. They were ascertained to be: First, availability of ocean tonnage at New York; second, lower ocean rates between New York and foreign ports; and, third, lower ocean insurance rates from New York. These factors were obviously sufficient to divert, in November last, nearly half of all the Canadian wheat from the west into U.S. channels.

"November is the rush month in the wheat trade. Market considerations may, under such circumstances, rise above the immediate question of rates. Delivery at a foreign port within a specified time may depend upon the choice of the dearest available channel, rather than the cheapest, and it is probable that this very situation caused the diversion of millions of bushels from the port of Montreal in 1911. Under such conditions, mere uncertainty as to ocean tonnage may turn the scale.

"Marine insurance rates remained unchanged during the year. In November they ran from 65c. to \$1.10 per \$100 from Montreal, as compared with 12½ to 15c. from New York.

FREIGHT RATES BY WATER.

"The department has very frequently been asked the question: What are the transportation rates per ton per mile on Canadian canals? It has always been impossible to give an answer. The information upon which to base an accurate calculation, so as to make, for example, a comparison between freight rates by water and freight rates by rail, has never been available. Carriers by water have not at any time been asked to disclose their freight charges. There is no good reason, however, why they should not be. Such carriers enjoy rather extraordinary privileges, and the whole question of transportation rates by land and water is manifestly of deep public interest. Railway corporations are required by law to give an exceedingly analytical statement of their operations, and carriers by water should at

	Through U.S. canal.	1909.	1910.	1911.
Grand total.....	57,165,161	57,096,279	65,622,481	

The "other Canadian ports" indicated above are ports west of Lake Erie, but not on the Georgian bay.

It is quite impracticable to follow the course of the small volume of Canadian wheat which passed through the U.S. canal at Sault Ste. Marie. With respect to that which passed through the Canadian canal, however, the figures work out in the following percentages:—

	1909.	1910.	1911.
Fort William to Montreal.....	21.9	25.5	20.1
Fort William to Georgian bay.....	27.9	24.6	15.6
Fort William to other Canadian ports.....	21.1	18.5	18.7
Fort William to Buffalo.....	26.7	30.3	43.8
Duluth to Canadian ports.....	1.3	.6	.7
Duluth to American ports.....	1.1	.5	1.1

In commenting on these figures the Comptroller of Statistics, J. L. Payne, says:—"It will be seen that 54.4% of all

least be asked to give such information as will enable the important question of freight rates to be definitely determined. Acting upon instructions, I propose to inaugurate for 1912 such changes in our statistical methods as will fully and definitely ascertain the freight charges per ton per mile by vessels operating on the inland waters of the Dominion.

"Meanwhile, careful study has been given to the data in hand in order to estimate the rate per ton per mile *cna.* by carriers using the canals. For this purpose three factors are required: first, the number of tons moved; second, the length of the haul in miles; and, third, the freight charges. Not one of them is definitely available at present. It is not known, for example, how many tons were transported through the canals. It is accurately known how many tons passed through each particular canal; but it has been found impracticable under the system which has long been in vogue to prevent some measure of duplication in making up the total. Under the methods to be adopted hereafter the tonnage will be absolutely accurate. The length of the haul in each instance has not been made a matter of record up to this moment. This will be corrected hereafter. The schedules in use have not taken cognizance of freight rates, and that, too, will be taken care of in the plan to be given effect in 1912.

"In this situation, it has been found necessary to select one of the gateways of our inland water system, and apply certain tests to the traffic flowing through it. The Welland canal was chosen. All through business between the lower and upper lakes, moving up or down, must pass that point. Here, then, is the first factor—the volume of traffic. The total number of tons which passed through the Welland canal during 1912 was 2,537,629. Of this aggregate, 842,919 were moved up, or westward; while 1,694,710 were moved down, or eastward. The relative proportions were 34% and 66% respectively. It is assumed that all the business which passed through the Welland canal was moved the whole distance between Montreal and Fort William—1,223 miles—or vice versa. This gives the second factor—the length of the haul.

"In an effort to ascertain the freight charges which prevailed in 1911, it was found that the rate on only one commodity, wheat, was definitely known. That is put down at \$1.50 a ton for carriage between Fort William and Montreal. It is probably the lowest rate at which any commodity is carried through the canals. The total volume of wheat transported through the Welland canal in 1911 was 562,282 tons, or a little over 22% of the total volume of traffic. Among the 32 commodities moved, there were 187,411 tons of general merchandise, on which a rate two or three times as high as \$1.50 a ton was probably charged. Having regard to the whole list, it is thought fair to assume, for the purposes of this estimate, that an average rate of at least \$2 a ton was levied. This is probably a low figure, in view of the fact that the average rate on the Erie canal in the last year for which information was obtainable, was equal to \$2.45 a ton for the distance between Fort William and Montreal; and the Erie canal is a barge canal, which provides the cheapest known form of transportation by water. This, then, gives the third factor—the freight charge.

"It will be seen that 2,537,629 tons carried 1,223 miles, would be equal to 3,103,520,267 tons carried one mile. The freight bill on 2,537,629 tons, at \$2 a ton, would be \$5,075,258. Dividing the ton miles into the freight earnings gives the quotient of 0.163c. a ton per mile. The rail rate from Fort William to Montreal on wheat is \$4 a ton, or 0.421c. a mile, so that the water rate is, by comparison, quite low. But in comparing the rail and water rates between these two points, it must be remembered that the railway

has to maintain its right-of-way, pay interest on capital invested, and meet all incidental operating expenses. In the case of transportation by water, the Government keeps up the right of way, pays the cost of operating the canals, and makes no charge of any kind to the vessel owner or shipper. The question at once suggested is: What is the contribution of Government toward the reduction of the freight rate by water?

"To answer this question, the first item to be taken into account is interest on capital invested. Without going into details, let it be said that the Government has expended \$80,000,000 in constructing the canals between Fort William and Montreal, and in providing otherwise for the navigation of that chain of waterways. In this \$80,000,000 is not included the very considerable cost of harbors and lighthouses. It represents practically the direct cost of the canal system by itself. The interest charges on that capital outlay, at 3½%, would amount to \$2,800,000 a year. This would be equal to a contribution of 0.090 a ton per mile on account of interest on capital. To this must be added the expenditure for maintenance and operation, which represents an average of \$1,400,000 a year. The contribution of Government on that account is equal to 0.045 a ton per mile. The account would thus stand, per ton per mile, as follows:—

Freight charges	0.163c.
Government contribution, interest.....	0.090c.
Government contribution, maintenance, etc....	0.045c.

Total. 0.298c.

"I am quite confident that when all the facts are positively ascertained for 1912, it will be found that the foregoing estimate is quite too low. It is below the results on the Erie canal, and not more than about one-third of the rate per ton per mile charged by European canals. However that may be, it will be observed that the contribution of Government in 1911 was equal to 0.135c. a ton per mile, or 83% of the freight rate charged by vessel owners.

"There is still another important and vital aspect of this matter. Of the 2,537,629 tons of freight which passed through the Welland Canal in 1911, only 1,296,480 tons, or 51% of the whole, consisted of Canadian products. The remaining 49% was composed of U.S. commodities, most of which passed from a U.S. port to a U.S. port. This would not in any way affect the freight rate; but it may be worth while to show what was the contribution of Government toward the transportation of exclusively Canadian business through the canals between Fort William and Montreal in 1911. The number of tons carried one mile in that case would be 1,585,595,040. Without going into the details of the calculation, as was done in a preceding paragraph, let it be said that on Canadian traffic only the account per ton per mile would stand as follows:—

Freight charges ..	0.163c.
Government contribution, interest	0.177c.
Government contribution, maintenance, etc....	0.088c.

Total. 0.428c.

"It will be seen that the Government contribution amounted to 0.265c. a ton per mile, as compared with 0.163c. charged by the vessel owners. Of course, as has been said, the actual freight rate is probably higher than 0.163c. per ton mile. Be that as it may, the calculation which has been made shows the probable freight rate by water, between Fort William and Montreal, to be slightly higher than the actual rate by rail between those points."

(There will probably be considerable divergence of opinion in regard to the Comptroller's calculations respecting the comparative cost of water and rail carriage as above quoted. We will be pleased to hear from any of our readers on this subject, which is a most important one and worthy of very full discussion.—Editor.)

B.C. Joint Stock Companies' Non-compliance with Regulations.

The following companies have been officially notified that they will be struck off the register of British Columbia companies unless they show cause to the contrary, having failed to comply with the regulations:—Vancouver Improvement Co.; Esquimalt Marine Railway Co.; British Columbia Towing and Transportation Co.; Victoria Towing Co.; Victoria Sealing and Trading Co.; People's Steam Navigation Co.; Westminster Steam Navigation Co.; British Columbia Deep Sea Fishing Co.; Fraser River Fish Co.; American Fish Co.; Imperial Steamship Co.; Burrard Inlet Sealing and Trading Co.; Pacific Traders and Navigation Co.; British Columbia Fishing and Trading Co.; Vancouver Steamship Co.; Slocan Trading and Navigation Co.; San Juan Fishing, Canning and Trading Co.; Northern Shipping Co.; Pacific Fish Co.; Western Dredging Co.; Clayoquot Fishing and Trading Co.; British Columbia Tug Co.; Victoria Fishing and Trading Co.; Lower Fraser River Navigation Co.; Vancouver Marine Ry.; Kelowna Shippers Union Co.; North British Columbia Navigation Co.; Rothsay Shipping Co.; Yukon Hootalinkwa Navigation Co.; Teslin Transportation Co.; Stikine Navigation Co.; Glenora Steamship Co.; Teslin Yukon Steam Navigation Co.; Casca Trading and Transportation Co.; Victoria, Bennett and Dawson Transportation Co.; Big Bend Transportation Co.; Dominion Steamboat Line Co.; Fraser River and Coast Navigation Co.; Card Steamship and Trading Co.; Yukon Flyer Line; Atlin Transportation Co.; Sandon Forwarding Co.; Vancouver Coast Line Steamship Co.; British Yukon Navigation Co.; British Columbia Fish Co.; Western Steamboat Co.; Pacific Barge Co.; Western Canadian Fish Co.; Victoria Steamship Co.; Coutli Shipping Co.; Venture Steamship Co.; British Pacific Fishing and Canning Co.; Vancouver Skeena River Navigation Co.; Everett G. Griggs Ship Co.; Skeena River Navigation Co.; C. Gardiner Johnson Shipping, Insurance and Wharfage Co.; British Columbia Transportation and Commercial Co.; G. H. Trench Tug Boat Co.; Virginia Dredging Co.; Greer, Courtney and Skene; Steamer H. C. Henry; Twin City Transportation Co.; North British Columbia Navigation Co.; Skeena River Transportation Co.; Cariboo Navigation and Development Co.; Island Dock and Warehouse Co.; Queen Charlotte Whaling Co.

A new steel yacht, costing \$11,500, with capacity for about 150 passengers, was launched from Polson Iron Works, Toronto, early in June, for the Royal Canadian Yacht Club. The hull is divided into five watertight compartments with steel transverse bulkheads between. Her dimensions are, length 70 ft., breadth 15 ft., depth 6 ft. 2 in., with a draught of four feet. She is equipped with compound jet condensing engines, with cylinders 7 and 14 ins. diam. by 10 ft. stroke, and is lighted by electricity.

The U.S. Senate recently passed a bill making it unlawful for any ocean or lake steamer of the U.S., or any foreign country, carrying 50 or more persons, whether passengers or crew, to leave any U.S. port unless equipped with an efficient apparatus for radio communication, in good working order, in charge of two or more skilled operators, one of whom must be on duty at all hours of the day or night, the apparatus to be capable of transmitting at least 100 miles. An auxiliary plant, independent of the vessel's main electric plant, must be provided, which will enable the operator for at least two hours to transmit messages 100 miles under all conditions of atmospheric disturbance, when it is safe for the operator to work.

Atlantic and Pacific Ocean Marine.

The arrivals of ocean going steamships at Montreal, for May, were 73, with an aggregate gross tonnage of 478,073.

The Elder Dempster Co.'s s.s. Canada Cape, from St. John, N.B., to Cape Town, South Africa, which was reported beached after a fire on board, has been floated and docked at Cape Town.

The Thomson Line s.s. Cairn Dhu sailed from Newcastle, Eng., June 13, on her maiden trip, and arrived at Montreal, June 25, being the first vessel by the Belle Isle route this season.

The Canadian Brazilian Shipping Co., Ltd., has been incorporated under the Dominion Companies Act, with \$300,000 capital, and office at Toronto, to carry on a general ship owning and navigation business.

A Montreal press dispatch of June 8 stated that the Canadian Northern Steamships, Ltd., would probably add another steamship to its fleet this year. Enquiry of the management fails to confirm this, and it is not probable that there will be any addition to the fleet during this year.

The British steamship Fishpool, which loaded grain at Montreal, early in June, for European ports, is a new vessel, having just been built at West Hartlepool, Eng., this being her maiden trip. Her dimensions are, length, 399 ft.; beam, 56 ft.; depth 26¼ ft.; tonnage, 4,552 gross, with cargo capacity of 8,200 tons.

The Dominion Government is calling for tenders for a fast steamship service between Canadian ports and British Guiana, calling at islands in the British West Indies, which have signed trade agreements with the Dominion, and for a second steamship service between the Maritime Provinces and Jamaica, calling at Bermuda.

E. J. Chamberlin, President, G.T.R. and G.T. Pacific Ry., is reported to have stated, June 20, in Montreal that a line of steamships would be placed on the Pacific by the company as soon as the railway was completed. The sailings will take place from Prince Rupert, from which port to the Orient, it is said, there will be a saving of two days.

It is reported at Victoria, B.C., that the underwriters have declined the offer of a Japanese syndicate for the purchase of the wrecked s.s. Empress of China, the sum not being high enough, and that they will take the vessel to Hong Kong, where temporary repairs will be carried out, sufficient to allow of her being taken to England, where she will again be offered for sale.

Holt and Co., operating the Blue Funnel Line, are reported to have withdrawn from the North Pacific conference, and notice is stated to have been given for shippers in the Orient that any consignment of freight given to that line will invalidate any claim to participate in the deferred rebates payable by the lines constituting the conference, amongst which is the C.P.R.

A press report from London, Eng., June 11, states that the Cunard Line has declined the offer of the White Star Line to pay the company for its services in connection with the saving of life in the Titanic disaster, but it will allow the crew of the s.s. Carpathia to receive gifts from the White Star Line as follows:—To the captain, 100 guineas; to the surgeon, purser and chief steward, 50 guineas each, and to each of the crew, one month's pay.

Sir Thomas Shaughnessy, on his recent return from Great Britain, is reported to have stated in Montreal, June 10, that no doubt the matter of new vessels for the Atlantic service, so constructed that they could be converted into auxiliary cruisers, would be discussed with the British Government, in the course of

the Dominion Premier's visit to England. He is also reported to have stated that he could not say whether the C.P.R. would tender in connection with the proposed West Indies service.

J. H. Welsford and Co., Liverpool, Eng., who control the Union Steamship Co., and who recently acquired the Canadian Mexican Pacific Steamship Co., and the Boscowitz Steamship Co., have made an offer to inaugurate a steamship service between Canada and Australia, if the Dominion Government will allow an adequate subsidy for three years. The matter is being discussed by the Vancouver board of trade, and probably a resolution, urging the Government to take up the matter will be passed.

In connection with the report that the White Star-Dominion Line was having two steamships built for the St. Lawrence service, to replace the Teutonic and Canada, the company has issued a statement to the effect that no new vessels are being built at present for this route, nor is the construction of any contemplated in the immediate future, but the company intends to keep abreast of its competitors by adding to its tonnage on the St. Lawrence and other routes, as occasion may require.

Maritime Provinces and Newfoundland.

The Department of Public Works received tenders, June 27, for the construction of a breakwater wharf at Carrs Brook, N.S.

The Dominion Atlantic Ry., at the end of May, commenced a new steamship service between St. John, N.B., and Halifax, N.S., by way of Digby, making two trips each day, with the steamships Prince Rupert and Yarmouth.

Work is proceeding on the construction of the wharf on the west side of St. John Harbor. The crib work is being pushed forward as quickly as possible, and the complete concrete construction plant arrived on the site, June 12.

The Reid Newfoundland Co. commenced a daily express steamship service between Port aux Basques and North Sydney, N.S., June 3, replacing the old tri-weekly service. The steamships Bruce and Invermore are being operated on the route.

The Island Tug Co., Charlottetown, P.E.I., has appointed the following officers for its vessels for the current year:—Fred M. Batt, captain W. P. Bourke, chief engineer W. McEachern; Harland, captain J. T. McLaine, chief engineer A. Roebuck; Islander, captain G. Batt, chief engineer J. Stewart.

Following the submission of Prof. Kirkpatrick's report on ice floes and currents between the main land and Prince Edward Island, the Minister of Railways and Canals has decided that Cape Tormentine, N.B., and Carleton Point, P.E.I., shall be the points between which the proposed car ferry service between the main land and the island shall be operated. The distance is given as 10 miles, and it is stated that not only is the route selected the shortest, but it offers the least difficulty to navigation at all seasons. Tenders will be asked shortly for the vessels, as soon as the type to be adopted is decided on.

Province of Quebec Marine.

Capt. L. A. Demers, heretofore Dominion Wreck Commissioner, has been appointed harbor master at Montreal.

W. S. Jackson is reported to have been appointed Superintendent of the Government shipyard at Sorel vice L. J. Papineau, resigned.

A resolution was adopted by the Quebec board of trade, June 11, urging the

Dominion Government to put the law respecting the reduction of the Quebec Harbor Commission to three members, in force, so that they could devote their whole attention to the many questions affecting the port.

The Minister of Railways and Canals, accompanied by the Ministers of Customs and Agriculture, inspected the canals between Prescott and Montreal, early in June, arriving at Montreal, June 6, where they were met by the Harbor Commissioners, and proceeded to Viauville, inspecting the harbor works en route.

The Quebec board of trade on June 11, again discussed the matter of the carrying of transatlantic freight intended for Quebec, to Montreal, and returning it to Quebec by rail. It was suggested that European shippers should be advised only to ship Quebec freight by those vessels which would land same at Quebec.

The Montreal Harbor Commissioners have added a bylaw to their regulations, requiring that the agent of every vessel arriving in the harbor, the cargo of which is subject to wharfage rates, shall within four days after arrival deposit in the Commissioners' office a certified copy of the manifest, giving names of consignees, description of goods, and weight, or measurement, according as the goods were carried by ton weight or ton measurement.

The steamboat Iona, owned by F. E. Hall and Co., Montreal, was burned recently on Lake Ontario, near Oswego, N.Y., while bound from Sodus Point, N.Y., to Quebec, with coal. She was a wooden vessel, and was built at Trenton in 1892. Her dimensions were, length, 123 ft.; breadth, 24.2 ft.; depth, 10.2 ft.; tonnage, 232 gross, 157 register, and she was equipped with engine of 10 n.h.p., driving a screw. The loss is stated as \$20,000, which is covered by insurance.

Plans for the improvement of the harbor at Quebec are in course of preparation, and it was expected that they would be submitted to the Public Works Department for approval, towards the end of June. It is reported that they provide for the commencement of a deep water dockage along the St. Lawrence River front from the west end of the Allan Line property in the direction of Sillery, and the erection of a grain elevator of considerable capacity. The plans for pier 2 have been approved, and it is stated that tenders will be invited shortly.

Ontario and the Great Lakes.

Capt. T. Lundy, a well known lake mariner, died at Toronto, June 14, aged 83. He was born in England, but lived in Canada for 70 years.

The vessel Toiler, which grounded recently near Cardinal, was released May 31, with very little damage, and proceeded to Montreal under her own power.

The North West Steamship Co. is reported to have decided to have built at Port Arthur a full size lake freighter, for trading between Port Arthur, Port Colborne, Georgian Bay ports and Buffalo.

A survey party is engaged in taking levels, etc., for the construction of the dock at New Liskeard, by the Dominion Government, at a cost of about \$15,000. The site selected for the dock is stated to be south of the old dock facing the lake.

The Ontario and Quebec Navigation Co.'s plans for 1913 include the construction of an additional steamboat for the Toronto and Quebec route. She will probably be 217 ft. long, with 43 ft. beam, and will be of similar type to its steamboat Geronia.

The Richelieu and Ontario Navigation

Co. is stated to have decided to build, for operation in the Montreal service, at the opening of navigation in 1913, a ferry steamboat, 200 ft. long, capable of carrying about 3,000 passengers. The cost is estimated at \$150,000.

The Richelieu and Ontario Navigation Co.'s steamboats Rapids Prince and Rapids Queen, recently completed their first trips, using oil as fuel, and C. J. Smith, General Manager, is reported to have stated that the change from coal to oil had proved a success.

The steam tug Home Rule, owned in Amherstburg, is reported to have been sold to Jas. Whalen, Port Arthur. She was built at Thorold in 1890, and is screw driven, with engine of 50 n.h.p. Her dimensions are: Length 74.9 ft., breadth 17 ft., depth 9.4 ft., tonnage 81 gross, 45 register.

The steamboat Ella Ross, which was burned at Parry Sound, June 5, was built at Deseronto in 1879, and was at one time named Gipsy. Her dimensions were: length 99.2 ft., breadth 27.8 ft., depth 6.4 ft.; tonnage, 228 gross, 125 register, and she was equipped with engine of 85 n.h.p., driving a paddle wheel.

The Canadian Interlake Line steamboat Hamiltonian was launched at Port Arthur, June 1. It was expected that she would be ready for service before the end of June. The company's freighter Indian, equipped with Diesel engines, was expected to arrive on the lakes, from Newcastle, Eng., by the end of June.

The Minister of the Interior, in speaking at Regina, Sask., June 11, stated that the Government had acquired 68 acres of water frontage at Port Arthur, on which would be built a terminal elevator, which, he stated, would, with the expected keeping open of navigation a month longer than customary, considerably minimize the chances of future grain blockades.

The Canadian Lake and Ocean Navigation Co. is reported to have withdrawn its abandonment of the wrecked steamboat Turret Cape, to have accepted \$35,000 from the underwriters in settlement of its claims, and to have resumed possession of the vessel. She was taken to Collingwood for overhauling and repairs, and it was expected that she would again be ready for service by the end of June.

The U.S. Lake Survey reports the levels of the Great Lakes in feet above tide water, for May, as follows:—Superior, 602; Michigan and Huron, 579.93; Erie, 572.54; Ontario, 246.82. Compared with the average May levels for the past 10 years, Superior was 0.07 ft. below; Michigan and Huron, 0.81 ft. below; Erie, 0.15 ft. below, and Ontario, 0.12 ft. above. It was anticipated that, during June, there would be a rise in Superior, Michigan and Huron, of 0.3 ft., in Erie, 0.2 ft., and in Ontario, 0.1 ft.

G. J. Guy, chairman of the Hamilton Harbor Commission, on his recent return from Ottawa, was reported to have stated that the commission's scheme for harbor improvements, covering the construction of a new landing dock, extension of the revetment wall, warehouses and railway switches, had been approved, and the work would be proceeded with at once. It was stated that the Government would spend about \$300,000 on the revetment wall this season, and that tenders would be asked shortly.

The District Engineer, Public Works Department, reports that soundings recently taken at Port Stanley indicate that the water has shoaled in a tongue from the westward outside the end of the new breakwater, and that soundings of less than 18 ft. extend 300 ft. outside the end of the breakwater and 225 ft. to the eastward of the alignment of the two lights. By approaching the outer

light on a course 311 deg., the shoal will be cleared. Soundings taken inside the breakwater indicate that vessels may draw 18 ft. as far in as the inner end of the east Government pier, from that point inward, 16 ft. only is available.

Manitoba, Saskatchewan and Alberta.

The Lake Winnipeg Shipping Co., Ltd., is applying for supplementary letters patent varying the provisions as to the number and amount of the shares of capital stock, and confirming a bylaw changing the number of shares from 5,000 to 100,000, and the amount of each share from \$100 to \$5.

The Department of Public Works has authorized the construction of a 40 ft. canal at Lacalle Falls, on the Saskatchewan River, where the city of Prince Albert, Sask., has a power plant. The settlement of this matter has been somewhat delayed, owing to the demand for a 50 ft. canal, but it is now considered that one of 40 ft. will be sufficient to carry any craft operating on the Saskatchewan River.

British Columbia and Pacific Coast Marine.

The G.T. Pacific Coast Steamship Co.'s s.s. Prince John was recently docked at Esquimalt for examination and repairs after stranding on Masset bar. She returned to service early in June.

The Board of Railway Commissioners has authorized the Vancouver, Victoria and Eastern Ry and Navigation Co. to build a dock and warehouse at Burrard Inlet, and has rescinded order 15093, Oct. 16, 1911, which authorized similar work.

The B.C. Marine Association has advanced the wages of longshoremen on the Vancouver waterfront from 35 to 40c an hour for day work, and from 40 to 50c an hour for night work and overtime. The wages of dockers and truckers are still under consideration.

The report of the Canadian North Pacific Fisheries, Ltd., for 1911, shows net earning from operation for the year of \$478,073, of which \$100,000 is required for interest on debenture stock, leaving a surplus for sinking fund, reserves and dividend on ordinary shares of \$378,073.

The Union Steamship Co.'s s.s. Chelohsin, which was recently damaged in the Skeena River, has had her repairs completed at North Vancouver, at a cost of about \$25,000, and has returned to service. The report that she was being equipped with oil burning apparatus is denied.

The steamship companies operating between Vancouver and Prince Rupert have increased their passenger rates between these two points, including intermediate ports. No change has been made in the rates to the south, and nothing is contemplated in regard to freight rates.

The Dominion Government has granted permission to the Victoria Sealing Co. to sell its fleet of sealing schooners, without prejudice to its claim for compensation advanced as a result of being deprived of its rights under the sealing treaty of last year, between Canada, the United States, Japan and Russia.

The Point Grey, South Vancouver, Burnaby and Richmond boards of trade have passed a joint resolution calling upon the municipalities to engage the services of an engineer to report on the dredging of the North Arm to 20 ft. at low water, and to build a suitable wing dam and protection works at the mouth.

Capt. H. G. Jarvis, Secretary-Treasurer of the Merchant Service Guild of British Columbia, has sent a complaint

to the Marine Department, that U.S. vessels when navigating British Columbia waters, consistently ignore the International Rules of the Road, which are in force there, and use the U.S. Inland Rule of the Road.

E. J. Fader, New Westminster, has applied to the city council for approval of plans for the extension of his wharf and for building a large warehouse, making the wharf 400 by 50 ft., the new warehouse being 42 by 200 ft. He stated that his business had been acquired by an English company with a capital of £250,000, and registration under the B.C. Companies Act would shortly be asked. It is said to be the intention to operate a steamboat service between New Westminster and Victoria.

The West Vancouver Transportation Co. has offered to transfer the whole of its ferry equipment to a new company for \$65,000, stipulating that an adequate ferry service be maintained between Hollyburn and Vancouver. The West Vancouver council has recommended the ferry company in course of formation to accept the offer of the ferry steamboats Sea Foam and West Vancouver, with all equipment, the same to be taken over and paid for as soon as the money by-law for that purpose has been carried and the municipality authorized to subscribe for shares in the company. A by-law is being prepared authorizing the issue of debentures for \$30,000 to purchase 300 shares of \$100 each in the company.

Department of Railways and Canals, Canada.

WELLAND CANAL.

NOTICE TO CONTRACTORS.

SEALED TENDERS, addressed to the undersigned, and endorsed "Tender for Port Colborne Entrance Improvements," will be received at this office until 16 o'clock on Wednesday, the 9th July, 1912.

Plans, specifications and form of contract, to be entered into can be seen on and after this date at the office of the Chief Engineer of the Department of Railways and Canals Ottawa, and at the office of the Superintending Engineer of the Welland Canal, St. Catharines, Ont., at which places forms of tender may be obtained.

Parties tendering will be required to accept the fair wage schedule prepared, or to be prepared by the Department of Labor, which schedule will form part of the contract.

Contractors are requested to bear in mind that tenders will not be considered unless made strictly in accordance with the printed forms, and in the case of firms, unless there are attached the actual signature, the nature of the occupation, and place of residence of each member of the firm.

An accepted bank cheque for the sum of \$20,000, made payable to the order of the Minister of Railways and Canals, must accompany each tender, which sum will be forfeited if the party tendering declines entering into contract for the work at the rates stated in the offer submitted.

The cheque thus sent will be returned to the respective contractors whose tenders are not accepted.

The cheque of the successful tenderer will be held as security or part security, for the due fulfilment of the contract to be entered into.

The lowest or any tender not necessarily accepted.

By order,

L. K. JONES, Secretary.

Department of Railways and Canals,
Ottawa, June 25, 1912.

Newspapers inserting this advertisement without authority from the Department will not be paid for it.—25029.

Dominion Government Steamship for St. Lawrence Ship Channel.

The C. G. S. Bellechasse, the launching of which at Kingston, Ont., was mentioned in our last issue, has the following dimensions:—Length over all, 140 ft.; length b.p., 130 ft.; breadth, moulded, 27 ft.; depth, moulded, 13½ ft.; draught mean, 9½ ft.; i.h.p. maximum, 1,300.

The Bellechasse has been specially designed as a survey and inspection steamer for the St. Lawrence ship channel service and will be used by the Superintending Engineer to the Government, V. W. Forneret, for the furtherance of the schemes below Quebec.

The vessel is built of steel throughout to Lloyds 100 A1 class and has a straight stem, elliptical stern, and five main watertight bulkheads. The hull has been specially strengthened forward and along the vicinity of the water line, as it is intended to utilize the vessel in light ice work during certain periods. Duplicate electric generating plants are installed on board, of 9½ k.w. capacity, each unit being capable of running the complete lighting of the ship, and in ad-

dition a set of Edison accumulators is provided capable of running 25 lamps for 10 hours. The search light, of 16,000 c.p., is placed on the foremast. The deck auxiliaries include the usual windlass, capstan, steering gear and boat hoisting winch, the former being specially designed for channel sweeping operations.

under a pressure of 180 lbs. per sq. in. The motive power is supplied from two cylindrical boilers fitted with Morison furnaces and working under a system of air pressure, the fan and engine being placed in the engine room. Each boiler is fitted with a patent temperature balance. The condensers are of the uniflux type and all the auxiliaries, circulating pumps, air pumps, feed pumps, bilge pumps, general service pumps, fresh water and sanitary pumps are independent of the main engines.

On completion the Bellechasse will undergo a series of exhaustive trials. In addition to the usual dock trials progressive trials from six knots upwards will be held, after which the full power trials will take place.

The Bellechasse has been designed by and built under the superintendence of Chas. F. M. Duguid, Naval Constructor to the Marine and Fisheries Department.

The Proposed Dry Dock at Quebec.

The Dominion Government, which recently asked for tenders for the construction of a dry dock and ship build-

Wireless Telegraphy on the Great Lakes.

We were officially advised, June 8, by the Naval Service Department's Radio Telegraph branch that the wireless telegraph stations at Sault Ste. Marie, Tobermory and Midland were practically completed, and would be in operation in a week or ten days thereafter. They are equipped with the latest type of wireless apparatus, and are up to date in every way.

These stations, and also the one at Port Arthur, which was put in operation in Dec., 1910, are owned and controlled by the Government, and will be operated under contract by the Marconi Wireless Telegraph Co. of Canada.

Tenders have been invited for the erection of a wireless station at Point Edward, near Sarnia, Ont., on which construction will be started as soon as possible. It is also intended to establish stations at Port Stanley, Port Colborne, Toronto and Kingston, Ont., and it is expected to have them ready by the opening of navigation next year.

The Marconi Wireless Telegraph Co. is operating wireless telegraph apparatus on all the C.P.R. upper lake vessels, Alberta, Assiniboia, Athabasca, Keewauwin and Manitoba, on three of the Northern Navigation Co.'s vessels, Hamonic, Huronic and Saronic, and on the Canadian Towing and Wrecking Co.'s barges, Empire, Imperial and Provence. These vessels are fitted with the 1½ k.w. apparatus, their range depending on the height of their masts and the distance between them, but it is generally in the neighborhood of 200 miles.

There are a large number of vessels on the great lakes operated by the Marconi Wireless Telegraph Co. of America, some of which are, 5 of the G. and M. Line, 10 of the Goodrich Line, 3 of the Northern Michigan S.S. Line, 5 of the P. and M. Rd. car ferries, 4 of the A.A. Rd. ferries, 5 steamboats of the Schenango S.S. and Rd. Co., 5 of the Detroit and Cleveland Navigation Co., 9 of the United States Naval Militia, 4 of the Chicago and Duluth Transportation Co., and between 10 and 20 belonging to companies of lesser importance. Of course a large number of these vessels ply in Lake Michigan and will not communicate with the Canadian stations.

Dry Dock and Shipbuilding Plant for Sydney, N.S.

The ratepayers of Sydney, N.S., on June 4, decided by a vote of 1,041 to 172, to grant a bonus of \$1,000,000 to the British Canadian Shipbuilding and Dry Dock Co., for the construction of a dry dock and shipbuilding plant there. The bonus will be paid in four instalments of \$250,000, on a minimum expenditure of \$6,000,000. The site selected is on what is known as the Brookdale property, just below the International pier, and within the city limits.

A. C. Ross, who is interested in the project, is reported to have stated, June 4, that work would probably be under way by the early fall, and that it is the intention to form a Canadian construction company to build the plant, but a large portion of the work, such as dredging, excavation, etc., would be sublet to local contractors. In order to carry out the Government requirements in regard to dry dock of the first class, the work will occupy about five years, but the marine railway and shipbuilding yards should be ready for operation within two years, and the first vessel should be launched within three years. A wrecking and salvage plant will also be operated.

Sir Henry M. Pellatt, Toronto, is one of the promoters of the company.

The C.G.S. Bellechasse.

ing plant for Quebec or Levis, has received a report, from M. F. G. Wilson, C.E., of England, who was specially engaged for the purpose, on the merits of the various sites suggested for the construction. In conversation with a representative of the local press, June 5, Mr. Wilson is reported to have stated that he had made a careful examination of all the plans submitted for plants at St. Joseph de Levis and Beauport, and had taken information from practical shipping men on ice conditions, etc., and learned their opinions as to the most desirable site. The opinions he had gathered from others would in no way influence his personal judgment, and his recommendation as to the site to be chosen would be discovered from his report.

It was stated in Ottawa, June 14, that the report submitted recommended the site at St. Joseph de Levis, it being stated to be the easiest of approach and less difficult for the proposed construction.

Capt. J. J. Riley, heretofore Superintendent of Pilots, has been appointed Dominion Wreck Commissioner, vice Capt. L. A. Demers, appointed harbor master at Montreal.

The investigation which is being undertaken by the Department of Trade and Commerce, with a view to the adoption of a strong policy for the development of Dominion trade channels, will cover the question of insurance rates generally, and also the proposal to establish a Canadian Lloyd's, which is now deemed to be essential.

New Freighter for Ottawa Forwarding Company.

The steamboat which is under construction at Kingston, Ont., for the Ottawa Forwarding Co., has the keel plate of steel, with keelson 18 by 6 ins., 70 lbs., of 1 beam type, with steel stem forging from keel turn, rivetted to keelson, and extending above the forward deckhouse to form support for the railing. The stern post is a steel casting with bulb for stern tube and shoe, all in one casting. The frames are 2½ by 3 by 5-16 in. angles, and the floor plates are 10 by 5-16 in. The frames throughout are spaced 18 ins. centres, and the deck beams 5 by 3 ins. steel angles are spaced 18 ins. centres and bent to 6 ins. in 25 ft. Deck stringers are 48 by 5-16 in., and side sheeting is formed up with a 48 by ¾ in. sheer strake and a 41 by 9-16 in. sheeting bolted below, from the bilge to the sheer line. The sides are protected by 2½ by 3 ins. angles, fitted with heavy oak wales, and the bottom is planked with 3 ins. oak planking securely bolted to the frames.

The deck house forward is of steel 24 ft. long, and provides quarters for the captain, first and second officers and quarters below deck for the crew in the fore peak of the hull. A collision bulkhead separates this section from the main hold of the vessel. On the top of the deck house is the wheel house, equipped with steam steerer and fresh water tanks. The after deck house is also of steel, 40 ft. long, forming enclosures for machinery and quarters for the engineers and cook. The galley and mess rooms are arranged aft of the engine room. The vessel's dimensions are, length over all, 113 ft.; beam, 25 ft.; depth, 9 ft. The machinery consists of a compound engine with cylinders 11, 22, 22 ins. diam. by 16 ins. stroke, open front type with link motion, supplied with steam by a boiler for a working pressure of 137 lbs. The equipment includes high duty duplex boiler feed pump, independent air pump and jet condenser, arranged to pump from the bilge in case of accident, two hand capstans and one double drum steam winch with mast and boom for handling cargo.

She is intended for the general river trade in lumber, coal, grain and package freight.

Improvements for Vancouver Harbor.

E. D. Lafleur, of the Public Works Department, has advised that in order to work out a comprehensive scheme of improvements for Vancouver harbor, to meet the future requirements of the port, a complete survey of the harbor be made, including Burrard Inlet, up to, and beyond the Second Narrows, False Creek and the North Arm of the Fraser River. He recommends that a pier or dock should be built at some point on Burrard Inlet most suitable for shipping, about 800 ft. long by 250 ft. wide, with at least 30 ft. of water at low tide at the shore end, with warehouses, tracks and full equipment for handling merchandise; a similar pier or dock at North Vancouver; the maintenance of a channel with a minimum of 15 ft. depth at low water from New Westminster through the sandheads to the Gulf of Georgia; improvement of False Creek, by locks or dam at the outlet, or both combined; the relocation of the C.P.R. bridge, and the continued dredging of the First Narrows until the widening is completed and the Parthia shoal removed, and the Capilano River diverted to the west to prevent sand being washed into the dredged channel. The Minister of Public Works has approved the outlines of the scheme and instructions have been given for the prosecution of the work.

Canadian Notices to Mariners.

The Department of Marine has issued the following:—

37. May 29. 95. British Columbia, Prevost passage, uncharted rock, buoy established. 96. British Columbia, Queen Charlotte islands, Hecate strait, Skidegate inlet, eastward of Deadtree point, buoy established.

38. May 30. 97. Nova Scotia, south coast, Peggy point, hand fog horn at light station. 98. Quebec, Restigouche river, changes in buoyage. 99. Quebec, River St. Lawrence, St. Pierre les Becquets, light discontinued.

39. June 8. 100. Prince Edward Island, north coast, Tracadie, change in position of front range lighthouse. 101. Quebec, Chaleur bay, Newport point, light improved. 102. Quebec, St. Lawrence river, Saguenay river entrance, Tadousac, new wharf. 103. Quebec, River St. Lawrence, Montreal harbor, Ile Ronde range, light on Guard pier discontinued, temporary back range light shown on new pier at Ile Ste. Helene.

40. June 10. 104. Ontario, Lake Ontario, Welland canal entrance, Port Dalhousie, change in front range light. 105. Ontario, Lake Huron, north channel, off Gibbons point, uncharted rock. 106. Ontario, Lake Superior, hand fog horn at light station on island west of Shaganash island.

41. June 11. 107. British Columbia, Vancouver Island, southeast coast, Victoria harbor, Brothie ledge beacon, change in characteristic of light. 108. United States of America, Washington, Destruction island light station, fog signal to be changed.

42. June 14. 109. Nova Scotia, southwest coast, Barrington bay, Congress shoal, buoy established. 110. Nova Scotia, south coast, submarine bell buoy to be moored near Sambro gas and whistling buoy for experimental purposes. 11. Nova Scotia, south coast, New harbor, whistling buoy moved to eastward.

43. June 18. 112. Nova Scotia, south coast, Coddle harbor, buoys established. 113. Prince Edward Island, north coast, Cascumpeque harbor, Alberton, change in position of range lights. 114. Quebec, Gulf of St. Lawrence, Gaspé coast, Great Fox river, change in position of front range light.

44. June 19. 115. Caution when approaching Canadian ports (Halifax, Quebec, Esquimalt), closing of ports, examination service. 116. Canada, signals

to be made by vessels approaching defended ports when inconvenienced by search lights.

New Steamship for C.P.R. British Columbia Coast Service.

The vessel which is under construction at Esquimalt, B.C., for the C.P.R. service on the west coast of Vancouver Island, as noted in previous issues, has the following dimensions:—Length between perpendiculars 232 ft., beam moulded 38 ft., depth moulded 17 ft.

She will be built of steel, in accordance with Lloyd's rules for a 100 A1 awning deck class of vessel, and will have double bottom throughout, and special tanks for oil fuel. The accommodation for both passengers and freight will be of the most modern type, specially suited for the trade in which she will be engaged.

The machinery will consist of triple expansion engines, with cylinders 20, 34 and 53 ins. diam. by 36 ins. stroke, supplied with steam by two boilers 13½ ft. diam. by 12 ft. long, and she will be capable of a speed of 12 knots an hour in the open sea.

International Inspection of Steamboats.

A United States steamboat inspection official at Oswego, N.Y., recently ruled that all boats plying between Canada and the U.S. must be inspected at U.S. ports. Francis King, counsel, Dominion Marine Association, took the matter up with the Secretary of Labor and Commerce at Washington, D.C., and received a letter from the acting Secretary, who said:—"It has long been the practice for inspectors of this country stationed at ports on the Great Lakes to inspect Canadian vessels at their home ports when requested by the owners, and this practice has been quite satisfactory to all interests. The local inspector at Oswego has been instructed by the Supervising Inspector-General, Steamboat Inspection Service, this department, to continue to inspect Canadian vessels at their home ports when requested."

F. E. Stearns, A.M. Can. Soc. C.E., has been appointed Assistant Engineer for the construction of the new Welland canal. He is a graduate of McGill University and has been engaged since 1907 on lock gate design on the Panama canal.

Sault Ste. Marie Canals Traffic.

The following commerce passed through the Sault Ste. Marie Canals during May, 1912:

ARTICLES	CANADIAN CANAL	U. S. CANAL	TOTAL

Dominion Steel Corporation, Ltd.

At the annual meeting at Montreal, June 12, the report for the period commencing July 1, 1910, the date of the present incorporation, to Mar. 31, 1912, was presented. The net earnings, after paying preferred and common stock dividends, were \$1,484,945.98. Of this \$700,000, forming part of the \$500,000 written off last year from the coal properties, and \$500,000 from the steel properties, as a special appropriation from the surplus earnings in addition to the usual full provision for depreciation, must also be deducted, leaving a surplus to be carried forward of \$784,945.98. The coal company's operations were satisfactory in every respect, and the prospects for the current year excellent. Up to June 11, the company was 192,291 tons ahead of the previous year's production, the output since Apr. 1, being 792,753 tons. The St. Lawrence business will show a heavy increase, if no serious drawbacks are met with.

Regarding steel, the company has suffered in common with all other manufacturers of iron and steel on this continent, from depressed conditions prevailing in the U.S., where prices were demoralized, but business there is improving and prices advancing. In addition the new finishing mills will soon provide a more profitable outlet for the steel, hitherto used as wire rods. The output of steel was substantially larger than in last year, and so far this year the output is well ahead of last year. The completion of the new plant has been subject to many delays, but the wire mills are running in a partial way to get the machinery and organization into shape. The first of the new blast furnaces is rapidly approaching completion, and the remaining extensions are well forward.

The Corporation has issued \$7,000,000 6% preference shares, and with regard to the issue of 2,500 shares of common stock it was explained that the requirements of the coal and steel companies in the way of lumber, piles, ties, pit props, etc., have grown to very large dimensions, reaching not less than 8,000,000 ft. annually, and to this supply is being added staves, heading and other things required in the new mills. To buy these supplies has become more and more difficult and costly, so it was decided to acquire the Sydney Lumber Co., Ltd., Dalhousie, N.B., consisting of saw mills, timber limits, etc., in running order, which will be used to serve both coal and steel companies, the corporation holding the stock. The same principle will be followed in the case of the Black Diamond Steamship Line, to which two vessels have been added this year.

The following were elected directors for the current year:—

Dominion Steel Corporation, Ltd.—President, J. H. Plummer; Vice President, Sir Wm. C. Van Horne; other directors, Sir Montagu Allan, G. Caverhill, Hon. G. A. Cox, Hon. R. Dandurand, Hon. R. Mackay, Hon. D. McKeen, Sir Wm. Mackenzie, W. McMaster, Jas. Mason, F. Nicholls, Sir Henry Pellatt, W. G. Ross and J. R. Wilson.

Dominion Coal Co., Ltd.—President, J. H. Plummer; Vice President, J. R. Wilson; other directors, Hon. G. A. Cox, Hon. R. Dandurand, Hon. R. Mackay, Sir Wm. Mackenzie, W. McMaster, Jas. Mason, W. D. Matthews, Sir Henry Pellatt, Lord Strathcona, Sir Wm. C. Van Horne, F. L. Wanklyn, E. R. Wood and M. Workman.

Dominion Iron and Steel Co., Ltd.—President, J. H. Plummer; Vice President, W. McMaster; other directors, Sir Montagu Allan, G. Caverhill, Hon. G. A. Cox, Hon. R. Dandurand, Hon. R. Mackay, Hon. D. McKeen, F. Nicholls, Elias Rogers, W. G. Ross, Sir Wm. C. Van Horne, J. R. Wilson, E. R. Wood and M. Workman.

Trade and Supply Notes.

The matter which appears under this heading is compiled, in most cases, from information supplied by the manufacturers of, or dealers in, the articles referred to, and in publishing the same we accept no responsibility. At the same time, we wish our readers to distinctly understand that we are not paid for the publication of any of this matter, and that we will not consider any proposition to insert reading matter in our columns for pay or its equivalent. Advertising contracts will not be taken with any condition that accepting them will oblige us to publish reading notices. In other words, our reading columns are not for sale, either to advertisers or others.

The Canadian Locomotive Co., Kingston, Ont., has increased its output from five locomotives a month to eight, and by the end of this year will be able to turn out 15 to 18 a month.

The American Vanadium Co. and its associated companies, also the Flannery Bolt Co., have moved their offices to the Vanadium Building, Forbes and Meyran Avenues, Pittsburgh, Pa.

The Nova Scotia Steel and Coal Co. now employs at its Trenton works, near New Glasgow, 1,100 men, their wages aggregating over \$500,000 a year. Its output of finished steel is 26,000 tons a year.

The Canadian H. W. Johns-Manville Co. has moved its Winnipeg office, to 92 Arthur St. The building 100 by 50 ft., six stories and basement, will be occupied solely by the company's staff, which is being increased, and for carrying stock.

The Safety Car Heating and Lighting Co.'s monthly publication, Safety Heating and Lighting News, for June, contains a number of illustrations of the company's exhibit at the Atlantic City conventions, with detailed descriptions of its various types of heating and lighting equipment.

Jacobs and Davies, Inc., consulting engineers, New York and London, Eng., have opened an office at 263 St. James St., Montreal, for the practice of general consulting and construction engineering, under the management of Paul Seurot, M. Am. Soc. C.E., as Canadian representative.

The Standard Underground Cable Co. of Canada, Ltd., has recently established a plant in Hamilton, Ont., where it has a site 400 x 600 ft., on which it has erected a three story brick and structural iron building 335 x 64 ft.; two one story saw tooth buildings 224 by 60 and 250 by 60 ft.; two one story buildings 90 by 646 and 70 by 30 ft., an office building and some small buildings, the buildings and their equipment representing, we are advised, an investment of \$500,000. The company manufactures electric wires and cables of all kinds for electric railway, light, power, signal, telephone, telegraph, fire alarm, and any other service involving transmission of electric current by underground, aerial or submarine circuits. These products also include cable accessories such as terminals and junction boxes, insulating materials, cable splicing tubes, hangers, etc.

The company's officers are:—President, J. W. Marsh; Vice President and Manufacturer, W. A. Conner; Vice President and General Sales Manager, P. H. W. Smith; Secretary and Sales Manager, W. H. Marsh; Treasurer, F. A. Rinehart; Assistant to Sales Manager, H. G. Burd. W. H. Marsh has been connected with the Standard Underground Cable Co. of Pittsburgh, Pa., as Superintendent of Construction for the past 10 years, and H. G. Burd has also been connected with that company as sales engineer in the New York office. The parent company began business in Pittsburgh in 1882 and now has also plants at Perth Amboy, N.J., and Oakland, Cal., with a total floor space of over 12 acres.

NOTICE TO CONTRACTORS.

TENDERS will be received by the undersigned for the substructures and superstructures of ten (10) bridges over the Fraser, Thompson and North Thompson Rivers on that section of the Canadian Northern Pacific Railway between Port Mann and the Yellowhead Pass, Province of British Columbia.

Tenders are to include any or all portions of the construction or the delivery of metal work only.

Detailed drawings, specifications, and forms of contract may be obtained on or after June 5th, 1912, at the office of the Consulting Engineers, Waddell & Harrington, Winch Building, Vancouver, B.C., upon the payment thereof of fifty (50) dollars. This amount will be refunded to those who bid on the work, upon the return of the bidding papers in good condition.

Total work to be completed before June 1st, 1913.

Tenders to be received at the offices of the undersigned, Metropolitan Building, Vancouver, B.C., not later than noon of July 8th, 1912, and to be enclosed in sealed envelopes marked "Tender for Bridge Construction."

The lowest or any tender not necessarily accepted.

MACKENZIE, MANN & COMPANY, LTD.

POSITION WANTED.

Technical Graduate, experienced in all classes of freight and passenger equipment in plant office and engineering, will make permanent change to company offering good opening. Apply box 117 S, The Railway and Marine World, Toronto.

POSITION WANTED

Superintendent or Master Car Builder open for position. Thoroughly familiar with all branches of car building and general mechanical industries; young, active, practical, with executive ability. Good references. Apply box 5880, The Railway and Marine World, Toronto.

Department of Railways and Canals, Canada

HUDSON BAY RAILWAY.

Notice to Contractors.

SEALED TENDERS addressed to the undersigned and endorsed "Tender for construction of Hudson Bay Railway" will be received at this office, until 16 o'clock, on Thursday, the 1st of August, for a section of about 68 miles from Thicket Portage to Split Lake Junction.

Plans, specifications and form of contract to be entered into can be seen on and after Friday, June 7th, at the office of the Chief Engineer of the Department of Railways and Canals, Ottawa, and at the office of the Chief Engineer of the Hudson Bay Railway, Winnipeg, at which places forms of tender may be obtained.

Parties tendering will be required to accept the fair wages schedule prepared or to be prepared by the Department of Labor, which schedule will form part of the contract.

Contractors are requested to bear in mind, that tenders will not be considered, unless made strictly in accordance with the printed forms, and in the case of firms,

unless there are attached the actual signature, the nature of the occupation, and place of residence of each member of the firm.

An accepted bank cheque for the sum of \$150,000.00 made payable to the order of the Minister of Railways and Canals, must accompany each tender, which sum will be forfeited if the party tendering declines entering into contract for the work, at the rates stated in the offer submitted.

The cheques thus sent in will be returned to the respective contractors whose tenders are not accepted.

The cheque of the successful tenderer will be held as security, or part security, for the due fulfilment of the contract to be entered into.

The lowest or any tender not necessarily accepted.

By order

L. K. JONES,

Secretary.

Department of Railways and Canals,
Ottawa, 7th June, 1912.

The Stuffy Sleeping Car Problem Solved

In 1785 Van Marum observed that oxygen gas through which an electric spark had been passed possessed a peculiar smell and at once tarnished a bright surface by mercury, but it was not until the year 1840 that the attention was again called to this fact by Schonbein. This celebrated chemist showed that the peculiar strong-smelling substance, to which he gave the name of ozone, was capable of liberating iodine from potassium iodide and of effecting many other oxydizing actions.

Researches, however, conducted with the greatest care, have shown that ozone is nothing more than concentrated oxygen. As the ozone exists naturally in the atmosphere, it has been rightly designated nature's disinfectant, and possessing this extraordinary advantage over all other disinfectants, that, while destroying the deleterious matter or organisms in the atmosphere, it imparts at the same time to the air certain positive properties, rendering it more healthful and invigorating for respiration.

Ozone is possessed of a very powerful and penetrating odor and very slight traces of this gas can be readily detected by the sense of smell. It has the power of oxydizing or destroying any offensive germs which the air may contain, and it is the most powerful oxydizer known.

The ozonair system of ventilation consists briefly of withdrawing the air supply from as clean and pure a source as possible and removing the smuts and other solid floating matter by means of a filtering screen. The clean air is then passed into a mixing chamber where it is purified and partially sterilized by means of ozone. From the chamber it is distributed by means of ducts to the various parts of the car.

The method of treatment imparts an artificial sense of coolness to the atmosphere, which is most refreshing in the hot weather. The distribution is scientific and practical. Draughts are avoided, and the amount of air and also the strength of the added ozone can be adjusted at will, so that the atmosphere in the car can be varied at any time. No complicated plant is required, the whole working is automatic and depends on the manipulation of two or three ordinary electric switches.

Write for Ozonair Booklet.

EDISON BSCo PRIMARY BATTERY

**The standard closed
circuit cell.**

When the demand for a commodity is constantly growing, public confidence is naturally strengthened, and the loss of popularity has the opposite effect.

Some special feature or clever advertising will often bring a product momentarily to the front, but only genuine merit will keep it there.

The production and sale of Edison Primary Batteries is constantly increasing, each year's record showing an improvement over the previous one.

A condition of this kind is gratifying in any line, but particularly so in the case of a primary battery, which is literally under inspection every hour of the twenty-four, day in and day out.

The confidence thus indicated is proof that the battery-using public appreciates the efforts of the manufacturer to make every cell or element, that leaves the works, of such character that it can be depended upon to furnish 100% efficiency.

In adopting the Edison BSCo cell as standard, you are assured of obtaining material of the highest grade, are benefited by the results of research work, constantly under way in a laboratory, which, for the purpose, has no equal, and share with us the value of the experience gained through our being the largest producers of this type of cell.

**The cheapest form of Primary
Battery energy.**

Synopsis of Dominion Land Regulations.

Any person who is the sole head of a family, or any male over 18 years old, may homestead a quarter section of available Dominion land in Manitoba, Saskatchewan or Alberta. The applicant must appear in person at the Dominion Lands Agency or Sub-agency for the district. Entry by proxy may be made at any agency, on certain conditions by father, mother, son, daughter, brother or sister of intending homesteader.

Duties.—Six months' residence upon and cultivation of the land in each of three years. A homesteader may live within nine miles of his homestead on a farm of at least 80 acres solely owned and occupied by him or by his father, mother, son, daughter, brother or sister.

In certain districts a homesteader in good standing may pre-empt a quarter-section alongside his homestead. Price, \$3.00 per acre.

Duties.—Must reside upon the homestead or pre-emption six months in each of six years from date of homestead entry (including the time required to earn homestead patent) and cultivate fifty acres extra.

A homesteader who has exhausted his homestead right and cannot obtain a preemption may enter for a purchased homestead in certain districts. Price, \$3.00 per acre. **Duties.**—Must reside six months in each of three years, cultivate fifty acres and erect a house worth \$300.00.

W. W. CORY,

Deputy of the Minister of the Interior.

YOU Need This Railroad Library

—a library that will give you the best up-to-date modern practice. There is no other reference

work in the world that so completely meets the needs of the railroad man as the INTERNATIONAL RAILROAD LIBRARY. This is an epitome of the years of experience of the best railroad experts in the country edited in a style that 18 years of experience in publishing home-study textbooks has proved the easiest to learn, to remember, and to apply. The volumes of this library are a part of a series of textbooks that cost \$1,500,000 to prepare. They are recommended by the highest authorities and are used in nearly all our leading universities and colleges. Not only can they be used to great advantage by superintendents, railroad officials, foremen, engineers, firemen, conductors, and brakemen as an authoritative guide in their work, but since they can be so clearly understood even by persons having no knowledge of higher mathematics, they can be used by all classes of railroad employees that are desirous of advancing to higher positions. Write for catalog now.

INTERNATIONAL TEXTBOOK COMPANY

Box 1072, Scranton, Pa.

Save Fuel—Increase Mileage—Improve Service

By the use of Dearborn Treatment. It costs but a few cents per thousand gallons—less than any other method of water treatment.

The Treatment loosens up old scale, so that it is easily washed out, and prevents new formation. No scale in boilers means great saving in fuel, and engine can make greater mileage per boiler washing.

Leaking troubles are done away with, and expense for boiler work reduced to the minimum. The average life of a set of locomotive boiler tubes in bad water districts can be increased 200 to 400 per cent.

Dearborn Treatment is made to suit actual conditions on division, shown by analyses of waters. Gallon sample required.

For Railroad and Steamboat

The Corbet Roller Bearing Truck

IS USED BY

The Canadian Pacific Railway

And Other Large Companies

This truck has many **SPECIAL** features over the old style, and is made Strong and Heavy, to withstand the abuse to which it is subject.

The Roller Bearings reduce friction to a minimum, thereby **Doubling** the Life of the Truck.

Purchasing Agents will consult their own interests by having this Truck in their Freight Sheds.

Co., Springfield, Mass.; Lynchburg Traction Co., Lynchburg, Va.; Chicago & Southern Traction Co., Chicago, Ill.; Calumet & South Chicago Ry. Co., Chicago, Ill.

THE LESSON

taught by this widespread use of Pay-As-You-Enter Cars is obvious. Increased Revenue, Accident Elimination and Schedule Improvement have been demonstrated in every case. Isn't all this sufficient to show that it always pays to operate the Pay-As-You-Enter Car? Why not remodel some of your present cars?

We license manufacturers and railways to build and use the Pay-As-You-Enter Car, the Patents on which are owned by

The Bradstreet Company gathers information that reflects the financial condition and the controlling circumstances of every seeker of mercantile credit. Its business may be defined as of the merchants, by the merchants, for the merchants. In procuring, verifying and promulgating information, no effort is spared, and no reasonable expense considered too great, that the results may justify its claim as an authority on all matters affecting commercial affairs and mercantile credit. Its offices and connections have been steadily extended, and it furnishes information concerning mercantile persons throughout the civilized world.

Subscriptions are based on the service furnished, and are available only by reputable wholesale, jobbing and manufacturing concerns, and by responsible and worthy financial, fiduciary and business corporations. Specific terms may be obtained by addressing the Company at any of its offices.

PROFESSIONAL CARDS.

THE RAILWAY AND MARINE WORLD is especially adapted for the publication of professional cards of engineers, inspectors, analysts, electrical experts, naval, grain elevator and other architects, solicitors, etc., who desire to bring themselves under the notice of the management and officials of the various steam and electric railway, steamship, grain elevator, telegraph, telephone and power companies throughout Canada, as well as the locomotive, car and shipbuilders, contractors and promoters of railway enterprises. THE RAILWAY AND MARINE WORLD is the only medium through which all these important classes can be reached.

Rates will be quoted on application.

KEEP DOWN REPAIR COSTS BY WELDING WITH "THERMIT"

You can keep them down by applying the "Thermit Process of Welding" to all broken rudder-frames, stern posts and other wrought iron or steel sections.

The weld can be made quickly and permanently, enabling you to take the vessel from dry-dock in two or three days, due to the fact that it is not necessary to dismantle the vessel.

We bring the materials to the job, as they are light and portable, doing the work by contract.

The large steamship companies, whose vessels plow the waters of the Pacific, Atlantic and Great Lakes, have saved thousands of dollars by using the "Thermit Process" for welding broken sections.

We are glad to state that the welding process has received the sanction of the British Corporation for the Survey and Register of Shipping, Glasgow.

Your repair costs can be kept down, if you will adopt the "Thermit Process of Welding."

Pamphlet No. 25 X tells the story. Write for it.

NEW 8-FEED DETROIT LUBRICATORS

CANADIAN DETROIT LUBRICATOR COMPANY, LTD.
WINDSOR, ONT.

The new 8-feed Detroit Locomotive Lubricator is used on superheater Mallet compound locomotives. The six outside feeds lead to the high pressure steam chests, the high pressure cylinders and the low pressure steam chests.

The two middle feeds can be used for two air pumps, or for one pump and an intercepting valve or for one pump and a mechanical stoker.

A half turn of the oil control valve permits of all the feeds being started or stopped instantly without disturbing the adjustment of the feed regulating valves. A quarter turn cuts off all but the two middle feeds.

The new Detroit Locomotive Lubricators give greater oil mileage, easier control and better lubrication than any other lubricators on the market. Our circular tells why.

"BROWNHOIST" LOCOMOTIVE CRANES

"Brownhoist" Crane Coaling Engine on N. Y., N. H. & H. R. R. from cars on side track.

A RAPID AND ECONOMICAL METHOD of handling coal from car to engine or from car to coal tipple. The crane coals the engine while it is being cleaned on the ashpit. It cleans the pit, placing the ashes into the car. Many roads use the crane to fill the pockets on their coal chutes. Time and money are saved on both of these methods of coaling an engine.

ON CONSTRUCTION WORK the crane is a labor saver. The crane excavates, drives piling with a pile-driver, handles construction material of all kinds, switches the cars, places heavy steel structures, and does all the lifting and moving of material.

AROUND THE SHOP AND YARD the crane handles ALL material. It can be equipped with either grab bucket, bottom block, or lifting magnet. Either one is easily and quickly applied.

"Brownhoist" Cranes are built for hard and continuous service.

A Westinghouse Cross-Compound Air Compressor

does not have to be aligned and requires no special foundation. It can be attached to a column, a wall or be mounted on the floor.

It is a compact, self-contained unit, securing a very high efficiency by compounding both steam and air with a low steam consumption. On a steam pressure of 100 lbs., working against 80 lbs. air pressure, it has a displacement of 150 cubic feet of free air per minute.

SAWS C M C SAWS

CMC No. 621 CAR RIPPING SAW

WE illustrate our latest improved Car Rip Saw, designed for the heaviest class of work and especially suitable for the heavy work of CAR SHOPS and SHIP YARDS.

It is of massive construction throughout. This feature, combined with its improved design, recommends itself to those requiring a heavy saw for hard work.

Two of these machines have just been sold to one of our largest railways for their new car shops.

The Arbor is of large diameter and runs in self-oiling bearings. The table is adjusted vertically by the hand wheel shown. A 32-in. Saw is regularly supplied with the machine.

Bulletins and Prices with full information on request.

FAIRBANKS - MORSE

Combined Gasoline Engine and Pump

Our Water Station Equipment will reduce your expenses, such as attendance, maintenance and fuel cost to a minimum. A great advantage in this system, whether for railroads water station or for town waterworks, is the little attendance necessary. A section foreman or a station agent can look over the engine and start it before taking up his other duties.

We contract for complete erection of these tanks and the furnishing of pumping machinery.

What is

JOURNOLENE?

It is an Asbestos Lubricant for Journals of all kinds of Railroad Trucks.

It is THE SUCCESS of the Age. We will prove it to you, as it is proved to others who have adopted it.

Write us. We will heal your troubles with Journals.

The Railway Asbestos Packing Company, Limited
SHERBROOKE, QUE.

Toronto Office : 117 Mail Building, King Street.

You Railway Men Should Know How Titanium Alloy Can Help You

You know well enough that the better the raw material, the better the product—which of course means less maintenance expense, greater profit on your investment and, in your case, greater freedom from wrecks and like troubles.

Knowing these things, you can readily see how Titanium Alloy can help you when you learn that it has been proved time and again the cheapest and most efficient of all alloys for purifying and strengthening iron and steel. When you include Titanium Alloy in your specifications you secure for yourself positive insurance against faulty iron and steel.

The paragraph below explains the purifying action of Titanium Alloy. Read it carefully.

Titanium Alloy will give you high carbon steel rails that are not brittle

Titanium Alloy is a combination of metallic Titanium with electrically refined iron. When added to molten iron or steel it combines chemically with the gaseous impurities, carrying them out in the slag. The metal left behind is clean and pure, and absolutely uniform in quality. Under test, this metal shows much greater strength and durability than ordinary metal. It is less affected by rust and corrosion.

Leading chemists and metallurgists here and abroad unite in praising Titanium Alloy and in strongly recommending its use in all steels and iron. Their opinions have been upheld by steel makers everywhere. Their belief in Titanium Alloy is proved by the fact that the 1910 output of Titanium steel was greater than the combined output of all other alloy steels.

Do you know that over half a million tons of Titanium rails (both Bessemer and Open Hearth) are now in use? The reason lies in the fact that Titanium Alloy increases resistance of the metal to shock and abrasion. It makes the rail less susceptible to heat and cold, which means less expansion and contraction and consequent breakage. It permits a substantial increase in the percentage of carbon without making the rail brittle.

Titanium rails cost about \$2 more per ton than ordinary rails. The Boston Elevated found their small extra cost more than balanced by their 41% greater durability, as proved by careful test. Many other roads report higher percentages with consequent economies.

It will make unusually durable your car wheels, axles and miscellaneous castings

For frogs, crossings, etc., Titanium steel is especially suited because of its unusually high resistance to shock and compression. It is far cheaper than other steels for special track work. This also applies to its use in axles and all other castings.

Titanium car wheels will give at least 20 per cent. greater mileage than ordinary chilled wheels. Their cost is only about 10c. more per 100 lbs. of wheel. The metal is denser, tougher and shows less tendency to chip. Titanium Alloy also improves steel wheels in the same degree.

Add our FREE BOOK No. 30 to your technical library. It is a compilation of valuable facts, figures and statements from men who know and value Titanium Iron and Steel.

Titanium Alloy is made for Canadian Consumption by Electro Metals, Ltd., Welland, Ont.

C. G. E. Gas Electric Cars

The Gas Electric Car

Electricity is the silent and efficient transmission link, furnishing power and brilliant illumination.

Is materially reducing operating costs and increasing traffic on branch railway lines wherever used.

The records of thousands of miles of operation in actual service prove the usefulness and reliability of this car.

Built as a Railroad Proposition

Strong, reliable, efficient and attractive. M. C. B. throughout. Just as the trolley car successfully displaced the horse car, so with equal success and profit the C. G. E. Gas Car is now replacing branch line trains.

Catalogue 4855 illustrates and describes the equipment and shows many car body designs. This will be sent you by return mail for the asking.

UNNECESSARY MACHINERY RUNNING
IS JUST UNNECESSARY EXPENSE

THE
“POSITIVE”

Combined Jaw and Friction Clutch
Will Solve Your Problems

The “POSITIVE” is the ONE Clutch that
Safeguards All Your Power and Your Money

It is a jaw clutch when running, yet it will couple a driving shaft at any speed into a driven shaft at rest against full load. Throw in the lever part way and the frictions grip instantly until the driven shaft attains the speed of the driver. The jaws then engage and transmit the power, the friction releasing. No wear; no slipping; no loss of power.

Canadian Brake Shoes Limited

334 St. James

STREET

Montreal, Que.

OFFICE
WORKS

The Editor:

June 28th,

1912

Canadian Railway and Marine World,
Toronto.

Dear Sir:

Three important questions have been raised, which we think, require an explanation:

1. Does the Canadian Brake Shoe give more mileage than other shoes on the market?

We do not aim at increasing the mileage by increasing the hardness of the iron in our shoe. Such extra mileage is made at the expense of the tire. Every 1/16 inch of tire wear costs as much as six brake shoes.

Our mileage records are the result of the fine grain, the equal quantities of combined and graphitic carbons, and the steel reinforcements. By this means we get maximum mileage, minimum tire wear, a high co-efficient of friction, and safety.

2. Does it wear thinner?

Seventy-five per cent. of our shoe is wearing material. As we have pointed out, the small increase in the shoe wear per mile is more than off-set by the higher proportion of wearing material per shoe. The double steel reinforcements bond together, strengthen and grip the shoe body. It cannot get away! It must wear thin!

3. Does it cost less?

Our shoe is 20% cheaper to mould--the steel backs are one-third cheaper to punch--it weighs 19 pounds; others weigh from 20 to 26 pounds each--it gives more shoes per ton--more wear per shoe--saves tires--saves labor charges--reduces scrap---. Yes, the Canadian Brake Shoe does cost less.

Yours faithfully,

Manager.

McAvity Improved Standpipe

Type G.

The McAvity Type G Standpipe, by its greater range of drop pipe, meets all requirements where different heights of tenders are in service. It is a combination of the Standard Sheffield Valve with carefully designed upper works. The telescopic delivery spout excels all other such arrangements in strength, simplicity and convenience in operating.

As there is no internal mechanism whatever in the McAvity Type G Standard, it is adapted for use in the coldest climate. Locks automatically and positively parallel with track when not in use.

Will revolve in complete circle. Operated by one man. Self-draining; cannot freeze. It is equipped with an automatic relief valve and water hammer is eliminated.

Prices on Application.

Why the C. P. R. North Toronto Route to Ottawa and Montreal is the Logical One

The train leaves as follows:

Leave North Parkdale	-	-	-	9.15 p.m.	Arrive Ottawa, 6.50 a.m.
Leave West Toronto	-	-	-	9.30 p.m.	Arrive Montreal, 7.00 a.m.
Arrive North Toronto	-	-	-	9.40 p.m.	Daily.
Leave North Toronto	-	-	-	10.00 p.m.	Will Stop at Westmount.

Electric Lighted Compartment Cars and Standard Sleepers for both points.

- ¶ The North Toronto route is over an hour faster and overcomes a long hill climb for the train out of Toronto, obviating any inconvenience and ensuring early arrival at Montreal and Ottawa.
- ¶ The roadbed has been improved till it is unexcelled in Canada.
- ¶ The equipment is "Canadian Pacific Standard," a synonym for the "best" and attentive porters, ensure efficient service.

Read This

This is what Mr. J. P. Murphy, G.S. for the L.S. & M.S. Ry., says about Bowser Systems:

"In the handling of oils the Bowser System is being used extensively, and with it, at every engine house where it has been installed we have been able to decrease our forces two men, one night and one day, as it has been entirely possible to have the supply man deliver the oils in addition to his other duties. The pumps are located so the oils and supplies are delivered over the same counter."

The Bowser always economizes. It saves its own cost and then continues to pay a remarkable dividend as long as you use it.

Let us send you our new Railroad Book listing all the outfits and explaining their adaptability, Free. Ask for Book No' 18.

Canadian Railway and Marine World.

August, 1912.

The Railway Viaduct and New Union Station at Toronto.

The railway viaduct through the lower part of Toronto, with the new union station, both of which were originally ordered by the Board of Railway Commissioners in June, 1909, are now assured and construction will soon be in progress, all the plans for the changes having been completed in a general way and approved by the Board of Railway Commissioners.

The original order of the Board of Railway Commissioners in June, 1909, called for a four-track viaduct from west of John St. to or near Berkley St., with three tracks either side of the viaduct at the present level of the Esplanade, with all necessary crossovers, the centre line of this viaduct to be located on the southern boundary of the Esplanade, this four-track portion of the work to be undertaken conjointly by the G.T.R. and C.P.R. Independent of this, the C.P.R. was ordered to elevate two tracks from

of its trains into a station to be built in the northern part of the city, and thus get away from the down town trouble. This matter is still under consideration. In view of this desire to take some of its passenger traffic to the north end of the city, the company took exception to its inclusion in the viaduct and union station scheme, and appealed the matter to the Board of Railway Commissioners, which last May ordered the work to be continued under the original order, with an extension of time for the completion of the project, the original two years having already expired. At the same time, the Board approved the G.T.R. plans as the more desirable, and ordered that they be followed instead of the plans for the same proposition supplied by the C.P.R.

The grade separation work at Toronto is divided into two separate portions, parts 1 and 2. Part 1 is the portion that

ing had a greater slope, so that at Strachan Ave., about 200 ft. from the crossing, the rails have been raised about 2 ft. This small rise has not made the raising of the bridge necessary, although a removal of the old bridge, with a more modern bridge to replace it, is under consideration, only such a move is apart from the viaduct scheme.

The 0.25% down grade continues beyond Bathurst St. This portion of the line in the old roadbed was through a cutting, which will be filled to the required depth, without the use of concrete retaining walls, which are necessary through the greater part of the viaduct length. The new rail level at Bathurst St. will be about 4 ft. above the former level, calling for the raising of the overhead bridge at that point a corresponding 4 ft. The highway from the north will have a small ramp, in place of the present practically level approach

Fig. 1. Plan of New Union Station, showing the Trackage, and Passenger and Baggage Facilities.

the easterly end of the four-track viaduct to near Queen St., with necessary viaducts over certain intervening streets. The corresponding section of the G.T.R. line was also ordered elevated on a two-track viaduct from the same point to Logan Ave., crossing the streets en route on viaducts. All streets were to pass under the tracks with the exception of John St. and Spadina Ave., both of which were to cross the tracks on bridges, to be constructed conjointly by the two railway companies. The city was ordered to pay one-third the cost of the viaduct including the elevation of the C.P.R. passenger car yard and G.T.R. Don sorting yard. The same proportion of the cost of the bridges at Spadina Ave., John St. and Eastern Ave., and the elevation of the substructure under the new Union Station was also ordered to be borne by the city. In addition to these liabilities on the part of the city, no damages can be collected by the latter for any city property taken for the proper carrying out of the scheme. Any question of damages between the two companies is to be reserved for settlement by the Board.

At that time the C.P.R. was contemplating taking at least a large number

is now nearly completed, stretching from Mimico on the west to the C.P.R. diamond crossing near Strachan Ave. in the city. Progress reports on this work have been made from time to time in these columns, and the issue of May last, contained an illustrated description of the extent of the work and the means by which it was being carried on. This portion of the work was done under a separate order from that relating to part 2 through the centre of the city.

The new profile the line assumes through the city is shown in Fig. 2, and a plan view of the new alignment and trackage arrangement as at present developed is shown in fig. 3, sections 1 to 4. It will be noticed that the work extends from the junction with part 1 at the C.P.R. diamond crossing on the west, to Logan Ave. on the east, where the line again strikes grade. Grade is struck on the C.P.R. line at Eastern Ave.

From the west, the line in part 1 of the work descends on a 0.4% grade until it strikes the junction with part 2 at the C.P.R. diamond crossing, where the downward grade changes to one of 0.25%, the elevation at that point being 24.0. The original down grade from the cross-

from the from the ridge of land along the north side of the railway right of way. The southern approach, at present a long ramp, will be made slightly steeper. The C.P.R. and the old Northern line of the G.T.R., which meet the main line just west of Bathurst St. require a very small fill, as the elevation of this line back from Bathurst St. is higher than the main line from Hamilton. At Strachan Ave., the Northern and C.P.R. lines cross at grade, while the other is in a long cutting as described.

A short distance east of Bathurst St., the line takes to the viaduct, the concrete retaining wall commencing at elevation 14.0. From that point to near Spadina Ave., the line is practically level, where at elevation 15.0 the line ascends on a 0.4% grade. To the north of the four through tracks that are elevated on the viaduct, there are the tracks at grade leading in to the G.T.R. freight yards and shops. It is the intention to leave these tracks as at present until such time as the work is completed, when the whole arrangement of surface tracks will be changed to better the yard conditions, to conform to the better through facilities

provided by the viaduct. Likewise, the tracks to the south leading to the G.T.R. old Northern wharves are to be left as at present for future rearrangement.

Under the present arrangement, only the tracks to the north of the G.T.R. shops are crossed by a highway bridge, 170 ft. long, an embankment leading from the southern end of this bridge to

leading westward to the G.T.R. shops and yard, and on the south there is a single track one leading easterly to the C.P.R. yard and roundhouse. Like the other yards mentioned, this large G.T.R. yard to the north will also require rearrangement on the completion of the viaduct scheme. From the point where the south ramp leads off, the viaduct

such an arrangement is undoubtedly more convenient for making up the trains, with no ramps to negotiate, but the principal reason lay in the matter of disposing of York St. Under the proposed arrangement, York St. passes under all the tracks, except the few leading into the C.P.R. freight house, in a subway. Were the car yards on the level, all

Fig. 3. Sec. 1. Plan of Viaduct Scheme from C.P.R. Diamond Crossing to Spadina Ave.

grade, the through tracks being crossed at grade. The proposed arrangement necessitates an entire change at that point, as the tracks being raised there about 6 ft. would make the city wharf immediately to the south of the through tracks impossible of approach except by a very steep ramp. The proposed plan is

widens to five tracks, the fifth one leading into the elevated C.P.R. passenger car yard to be mentioned later.

At John St., the track level has been raised 11 ft., with a corresponding raising of the overhead bridge at the point where it crosses the viaduct. The approaches will be as before, the south one

these tracks would have to be crossed by the street on the level, reducing the effectiveness of the whole scheme of level crossing elimination. The shunting around of the cars in the making up of the trains would be a constant source of danger, and from the railway standpoint, the yard accommodation would be ma-

Fig. 2. Profile of Viaduct Scheme, from C.P.R. Diamond Crossing to Logan Ave.

to cross all the tracks on a bridge about 770 ft. in length leading from the higher land on the north, with a slight ramp, and extending beyond the most southerly tracks. The city wharf to the south is to be filled in, making an approach ramp 700 ft. long, meeting Lake St. produced. Practically the whole of this approach will be over present water lots. That part of the future extension of Lake St. is also water.

leading to the extension of Lake St., which it is expected will be made such a thoroughfare as to divert a lot of the traffic that at present crosses and recrosses the tracks from a lack of roads to the south of the track. Consideration was given to the possibilities of a subway at this point instead of the overhead bridge, but the plans were abandoned in preference to the accepted scheme, on account of cost.

terially reduced by the breaking up of the trains at the crossing. On the north of the tracks leading into the station, there is a single track easterly ramp leading down to the express building just west of the station. The tracks at York St. are raised 16 ft. above their former level.

From the easterly end of the elevated C.P.R. coach yard, there is a westerly ramp, single track leading down into

Fig. 3. Sec. 3. Plan of Viaduct Scheme from between Scott and Church Sts. to Don freight yards.

The through line continues on the ascent on the 0.4% grade to near York St., where the level is attained at elevation 26.5. Between Spadina Ave. and John St., there are two ramps leading down from the four-track viaduct. On the north side, there is a double track ramp

From John St., the tracks on the viaduct diverge, the northern portion running through the new union station, and the southern lot forming the new C.P.R. passenger car yard. Various considerations entered into the reasons for the raising of this yard. In the first place,

the C.P.R. freight shed. This ramp leads off from Bay St., where the street is taken under the wide stretch of tracks in an 80 ft. subway. Just east of Bay St., on the north side, there is a new express building, on the level of the viaduct. Yonge St. is crossed on an 80 ft. subway,

tracks. Likewise, the distance between Berkeley and Parliament Sts., is so short that a retained viaduct would be more costly.

From the east end of the steel viaduct, the G.T.R. four tracks sweep southerly and loop northward, forming a small elevated yard at the curve. The north side of the viaduct, from the point where it

leaves the steel work to the Don River bridge, is retained by concrete walls, while the south side is merely embanked. Trinity and Cherry Sts., both pass under the tracks in subways. From a central point on the north side, there are two ramps, one in each direction, leading down to the surface tracks. The east end ladder track on the south side also leads down a ramp along the edge of the earth embankment. The surface tracks on both the north, where the freight sheds are

located, and on the south sides, are subject to re-arrangement on the completion of the viaduct scheme. From the Don easterly, there is a four-track viaduct on an earth embankment, crossing Eastern Ave. and Queen Sts. on 66 ft. subways. The grade up to Queen St., is 0.4% com-

pensated. At Queen St., the elevation is 39.5, the line at that point gently sloping up to meet the old level at Logan Ave.

The C.I.R.R. line where it leaves the steel viaduct at Parliament St., is carried on an earth embankment up to the point at which it again strikes grade at Eastern Ave., with the exception of the short stretch of reinforced concrete viaduct where the double track line crosses Trinity St. on a 66 ft. subway. The Overend and Front St. subways are both 33 ft. Eastern Ave. is to cross the tracks on an overhead bridge, which will probably be of the same type as that further along at Queen St., where the bridge, with long, easy approaches, crosses both the tracks and the river. All the subways along the whole line, with the exception of Trinity Front and Vine streets are to have a clear headway of 14 ft. Trinity, Front and Vine streets are to have a smaller headway of 10 ft. The overhead bridges are all to have a clear headway of 22 ft. 6 ins.

It will be noticed in the description of the viaduct, that there will be no level crossings at Bay, Yonge or Church Sts.,

about 300 by 100 ft. in which is the main waiting room. As the elevation figures on the plan show, the waiting room floor is, at practically the same level as that of the street. At either end of this main structure, there are smaller rooms which will probably be allocated for lavatories, etc., when the details of the design are finally worked out. The plan, as shown, merely gives the general arrangement, without regard to the refinements in interior arrangement that will follow later.

At the west end of the building, there is a large addition 100 by 80 ft., which will probably be used for a dining room. There is another room of similar proportions to the rear of this room. To the east of the main waiting room are the baggage facilities in an addition extending over to Bay St. This building will have a floor space of 59,000 sq. ft., of which there is 7,000 sq. ft. for baggage in bond, and 5,000 sq. ft. for hand baggage. The Bay St. end is to be sectioned off for the postal service.

Between the main waiting room and the tracks, there is a concourse 80 ft. wide, the full length of the waiting room.

length over the centre of each track the width of the smoke stack, and at such a height as to just clear the stack. The double-track spans rest on columns down the centre of the passenger platforms. These passenger platforms are about 20 ft. in width, leaving a 10 ft. space along each side of the central dividing fence, which should prove ample for each track. The standing capacity of the 10 tracks will be 290 cars of the standard 70 ft. length.

Between each passenger platform, there is a separate baggage platform about 12 ft. wide, for the handling of all baggage clear of the passenger platforms. The baggage is unloaded on the side opposite to that on which the passengers leave, on to trucks in the usual manner. At the westerly end of the baggage room, there is a subway leading under the tracks at the same elevation as the baggage room floor, 14.5. Leading down into this baggage subway, there is a lift from each baggage platform on to which the trucks are run, and lowered to the baggage room level. The baggage room is rather extensive, for not only is there

Fig. 4. Cross Section through Union Station and Passenger Subway under Tracks, showing Interior Arrangement.

all the surface tracks crossing streets being further east. The Board has ordered that none of these surface tracks between Church and Parliament Sts. be operated during May, June, July, August and September except between 10 p.m. and 6 a.m., unless the merchandise carried be of a perishable nature, in which case the train may operate if preceded by a flagman on foot.

The city is to bear one-third the cost of building the viaduct which is to include the C.P.R. passenger car yard and the G.T.R. Don sorting yard, excepting the cost of rails and track laying. Likewise, it is to bear one-third the cost of the bridges at Spadina Ave., John St., and Eastern Ave., and of the substructure made necessary by the elevation of the station. These payments are to be made as the work progresses on the submission of progress reports.

The new union station is to be located facing on Front St., between York and Bay Sts., east of the present location, and will occupy the entire frontage between these two streets. The station plan, as prepared by the G.T.R., is shown in fig. 1, and a cross section through the station is shown in fig. 4. The only portion of the old station retained is the old Canadian Express Co.'s building to the west of the new station on York St. This building is to be increased in capacity by the addition of another story, and a similar structure will be erected to the east of the new station on the east side of Bay St., for the Dominion Express Co., the main floor of this latter being on the viaduct level, while the old building is to retain its former level, with the tracks leading down to it from a ramp as previously explained. The two buildings will thus bear the same relation to the station.

The station building is to be located 80 ft. back from the street curb. Along this curb, there is to be a 23 ft. sidewalk, instead of the former 13 ft., back of which will be a 45 ft. driveway, separated from the station building by a 12 ft. sidewalk along the wall. The central part of the station building is a large structure

This concourse slopes down with a 4.10% slope from the waiting room elevation of 19.0, to that of the subway under the tracks, which is at elevation 14.5. The subway from the concourse runs under the whole ten tracks, with stairs on each side up to the platform level of 27.3. Outgoing passengers come into the main waiting room from the street, and on into the concourse, where they are met at the entrance to the subway by the ticket examiner, who directs the passengers to the correct stair, each stair being numbered, and a large sign will give the time of train departure, its name and general routing. At the top of the stairs there are two gates, one to each track, a fencing down the centre of the platform dividing it. The gate of the outgoing train will be the only one open, so there will be no confusion in taking the wrong track. The trainman will also be located at this gate instead of at the train steps, to again examine tickets and direct the passenger to the proper car. The ticket offices are along the south wall of the main waiting room, on the path of the passenger from the street to the tracks. In the event of the passenger having purchased his ticket at the city ticket office and driving down, he can drive up to the baggage delivery entrance, have his baggage removed and checked, and can then go directly into the concourse through the 19 ft. passageway along the east side of the waiting room. For the outgoing passenger, the conveniences are excellent.

The incoming passenger comes out through the subway into the concourse where he can pass out either side exit, without having to pass through the waiting room. If he has baggage, he will come out by the passage on the east side wall, where the baggage rooms are located. The station has been well designed for the relieving of the waiting room for needless through passage.

All the tracks in the station are through tracks, with no stubs. The 10 tracks are 1,500 ft. long, and are covered with the Bush low type two-track span train shed, with openings the full

the space in the building at the end of the main waiting room, but there is a large space extending out under four tracks. The hand baggage platform at the west end of the baggage room, is at elevation 18.5, 4 ft. above the baggage room floor, so that all hand baggage can easily be handed up to the hand baggage storage along the concourse exit. Bay St., along the side of the baggage room and under the track has been increased in width from 80 to 110 ft., for 110 ft. under the tracks. There is a driveway 80 ft. wide by 150 ft. long in the Bay St. side of the baggage room. All this space provides ample accommodation for the baggage wagons coming into the station. The outside area is slightly lower than that of the baggage room floor, so that no lifting of baggage on to the wagons is required.

The express traffic is handled through the station in the same manner as the baggage, a subway with lifts running under the tracks from the two express buildings.

The question as to what extent the C.P.R. will use the new union station is still in doubt, and if that company decides to withdraw a large portion of its passenger service, a modification of the station plans may be necessary. It appears to be settled that the C.P.R. and Canadian Northern Ry. will build a union station at North Toronto, to which a large portion of the C.P.R. passenger traffic may be diverted and all the Canadian Northern Ry.'s passenger business will be handled there, as it is not the latter company's intention to use the down town union station at all, its present use of the existing union station being only temporary.

During May, 19 fatal, and 29 non-fatal accidents were reported, in connection with Canadian railways. Of the fatalities, six were due to being run over, three each to falls and to being struck by trains, two each to being crushed between cars, and to falling material, and one each to a collision, to jumping from a locomotive and to a fall.

OIL BURNING LOCOMOTIVES ON THE CANADIAN PACIFIC RAILWAY.

By Frederick H. Moody, B.A.Sc.

For the second time this year the subject of oil for fuel is being discussed in these columns, the previous instance being in the April issue, when the oil burning motor car which the Grand Trunk Ry. is operating from Black Rock, N.Y., to Port Colborne, Ont., was described with particular reference to the motive power end with its oil fired boiler.

The equipment to be described on this occasion is that of the C.P.R., the management of which has for some considerable time been contemplating the use of fuel oil for locomotives on the British Columbia Division. Those at present equipped and in the course of equipment number 90, of which 14 are for the Esquimalt and Nanaimo Ry., on Vancouver Island. Seven stationary boilers for pumping plants at oil storage plants on the B. C. division, are also being equipped for oil burning.

In view of the widespread interest being evinced in the use of oil for fuel, not only in Canada, but more particularly in the southwestern part of the United States, it is the intention to include here a brief history of the use of fuel oil for railway motive power, from the time its use has been so seriously considered, this period being confined for the most part to the last decade, or slightly longer.

It is said that the first serious attempts at the use of oil fuel in the United States were in 1894 on the Southern Pacific Rd., although the Santa Fe lines experimented as far back as 1887, these early attempts being the result of a scarcity of coal and an abundance of crude oil, making the use of the latter highly desirable if some method of employing it that would prove as satisfactory as the use of coal could be devised. The results of many years of patient experimental work have been crowned with success, so that today, nearly all the lines in the southwestern States use crude oil as locomotive fuel, with the best of results. Since that time, the practice has been taken up by a number of other roads among which is the C.P.R.

When the first attempts at the use of oil for locomotive fuel were instituted in the U.S., there was a certain amount of precedent upon which to base the designs, for it had been employed with a marked degree of success in the Baku oil fields of Russia. The great difference in the many conditions surrounding the use of oil in the two widely separated districts, with their distinctive ideals in motive power, left a great many difficulties in the path of the early experimenters, which had to be solved independently of the results obtained under the other entirely different conditions.

In the first attempts at its use, the coal burning grates were retained, but the experimenters soon learned that satisfactory results could not be obtained with the draught spread over such a wide area as that presented by the grate surface, and that it must be concentrated. The uncontrolled influx of cold air proved very detrimental to the flues, and, what was even more important, surplus oil in dripping down from the burner, instead of falling on a retaining surface where it might still burn off to advantage, dropped down into the ashpan and frequently burned in them with destructive results. Tight ashpan have been known to flood, and the overflow on the roundhouse floor and pit furnished an ever present source of danger from conflagration. The oil over everything gathered up a lot of unnecessary dirt, making the use of the old grate bars an undesirable feature of oil burning equipment.

In the earliest attempts, the burner was placed at the rear of the fire box, the same as the burner of the G.T.R. oil burning motor car referred to earlier. The flame was directed forward under an arch, by which it was deflected backward and up into the flues. Except for light running, this proved an undesirable arrangement, as the draught would lift the flame over the arch and cause it to enter the flues without being completely consumed, and without a full utilization of the fire box heating surface area. The result was a dense black smoke at the stack, and a corresponding decrease in the amount of heat drawn from the oil from its incomplete combustion.

This unsatisfactory arrangement was replaced with a "flash hole" arrangement whereby a small hole in the grate, which was bricked over, provided a vertical draught to meet the spray of oil

1904 it was discovered that additional draught was required to completely consume the vapor. This was accomplished by admitting a draught of air through a hood in the fire box door, which mixed with the upwardly deflected spray, adding sufficient air when the spray was already partially consumed to complete the combustion. This arrangement constitutes what is called the horizontal draught system. Essentially, it is the system at present in use on a number of roads, but with slight variation to meet the individual ideas of the different designers. Since the day the horizontal draught was introduced, the development in oil burning equipment has been one of refinement rather than anything radically different in design.

Coming more specifically to the C.P.R. practice, the equipment as installed on the company's locomotives, to the design of the mechanical department, based on the results of the findings of the motive power officials of the Southern Pacific Rd., will be described. In the first place, the oil burning equipment being applied to existing locomotives designed for the burning of coal,

Fig. 1. Piping Arrangement on C.P.R. Oil Burning Locomotives.

from the burner, which was still located in the same position at the rear of the fire box. The brick arch in the same location was likewise retained. The vertical draught striking the horizontal jet of spray at right angles gave very satisfactory results in the combustion of the oil. This arrangement prevailed until 1903.

In that year, the burner was changed in position from the rear to the front of the fire box, the flame being directed forward from under the arch, circling up at the rear of the fire box, and then forward through the flues, the flame striking all parts of the heating surface and at the same time being given a longer period in which to become completely consumed before passing into the flues. While this was an improvement on the then existing methods, there was still a great deal of difficulty experienced from incomplete combustion of the oil vapor when the locomotive was working hard, even with this longer path in which to burn. Various changes in the shape of the arch were tried with varying degrees of success, until finally in

the idea borne in mind throughout was to change the construction of the locomotive as little as possible, but rather to adjust the oil burning details so as to work into the existing design.

In consequence of this limitation on the design being required to fit old locomotives, the oil storage reservoir is a separate tank so constructed as to fit into the coal space of the tender. Other reasons exist for such an arrangement, principal among these being the fact that if the tank were made integral with the water tank, the locomotive could not be employed off the division on which oil was the fuel employed. In addition, combining the two tanks makes it more difficult to undertake repairs. The tanks of the C.P.R. locomotives are built up of $\frac{1}{4}$ in. plate throughout, and are divided into eight communicating compartments, as in water tanks, with a central dividing wall and three cross walls, all of $\frac{1}{4}$ in. plate. The inside over all length is 13 ft. 3 ins., and width 9 ft. 5 ins., with a depth at front of 5 ft. 3 ins., and at the rear of 3 ft. 6 ins. The

capacity of the tank is 3,000 imp. gals. The tank is filled through a cast iron manhole in the top, on which there is hinged a cast iron door, held down on the manhole, which has an 18 in. opening, by four $\frac{1}{2}$ in. swing bolts, which drop back on the top of the tank when the cover is opened for filling.

In the bottom of the tank, there are two pipe openings, one of which connects with the locomotive, as may be noted in fig. 1 showing the application of the oil burning equipment to the fire box. On each side of the tank centre line, there is a valve of the form shown in fig. 2. That on the left is for the feed, and that on the right is for draining off water or draining the tanks, this latter valve leading into a short length of pipe outside the rail, where the oil may be thrown away, or, by a further connection, drawn off into a storage tank, when for any reason the tank is to be cleaned or repaired. The construction of the valves is simple. A cone on the lower end of a valve rod, guided in a bridged frame on the bottom of the tank, fits into a corresponding opening

Fig. 2. Drawing Off and Drain Valves In the Oil Tank.

in a cast member rivetted to the bottom of the tank. An upper plunger rod is connected to this valve rod by a length of chain, this upper plunger rod being guided in the top of the tank through a packed gland which prevents the oil and oil fumes from escaping around this rod. A two position handle of the form indicated, raises or lowers the valve into the open or closed position. When the handle is vertical, the valve is held closed by the coiled spring wound on the valve rod, bearing on the top of the valve and on the under side of the bridged guide. These valves have thus only two positions—wide open and closed. The two openings in the top of the tank between these two are for a $\frac{1}{2}$ in. pipe connection from the locomotive for the heating steam. The oil in the tank in cold weather tends to coagulate and will not run freely. To overcome this difficulty, two different methods of heating the oil are in use. The first is similar to the one described in connection with the G.T.R. oil burning motor car, where there was a steam coil in the oil tank,

encircling the oil valve outlet. The method employed in this case, which is the one in most general use, has the steam pipe, in this case $\frac{1}{2}$ in., extending down into the oil nearly to the bottom, where it branches with a T connection, and on the end of each branch there is a downwardly projecting elbow from which steam is blown through the oil around the drawing off valves, keeping it in a freely flowing fluid state as required. The principal objection to this method of heating the oil lies in the

Fig. 3. Gauge for Reading the Depth of Oil in Tank.

fact that the condensed steam mixes with the oil in the tank, instead of passing off through the coils as in the radiation method of heating. This water in the oil must be prevented from passing off into the burner with the oil. Water, from its higher specific gravity, settles to the bottom in the tank, thereby presenting a simple method of keeping the oil and water separate. The drain valve in the bottom of the tank, which has been described, is flush with the bottom. The feed valve, on the contrary, has the valve face raised above the tank bottom 2 11-16 ins. below which level the water may accumulate and be drained off from time to time through the drain valve. Normally this drain valve is left closed, and the feed valve kept open, the burner control being at a point further along the connection. It may be mentioned that these valves, while controlled in this case from the two position handles on top of the tank, in the majority of designs with a control system similar to this have the control handles on the front end of the tank connecting to the valve chain through a bell crank.

Each tender has a measuring rod as in fig. 3, to determine the quantity of oil remaining in the tender. This is accomplished by noting the depth of oil in the tank and then referring to a capacity table for the quantity this indicates. The fireman is at all times aware of the conditions of his fuel. The construction of the measuring rod is very simple. A short length of 1 in. pipe, with $\frac{1}{2}$ to 1 in. reducer on its upper end, is mounted on the top of the tank by two nuts, on each side of the top plate. Through this pipe there is a $\frac{1}{2}$ in. square rod extending to within $\frac{1}{4}$ in. of the bottom of the tank, and graduated in inches

er, where the flow of oil is regulated by the fireman, before passing into the burner. Steam for various auxiliary purposes is drawn from the steam dome through the piping to be seen at the top of this illustration. From a steam header on the back sheet of the fire box, the different connections branch off. Referring to the end elevation in fig. 1, the $\frac{3}{8}$ in. connection on the right leads to the heater. The third, or $\frac{3}{4}$ in. connection, leads down and through another flexible conduit to the tank, pro-

viding steam for the heating of the oil in the tank before drawing off. The middle, or $\frac{1}{2}$ in. pipe of this battery of three, provides steam to the burner for the atomizing of the oil. To meet these requirements, steam for the blower can be drawn from the dome. Provision is likewise made for steaming the boiler when cold by a shop connection to a 3 way valve on the outside of the smoke box, a connection running back along side the boiler to the header mentioned. Through the 3 way valve steam can be drawn from the shop main and passed to the burner and also to the various heating connections.

The type of heater or oil "super-heater" used is shown in fig. 4. This second heater is required to maintain the free flow of the oil to the burner and to keep the oil from thickening between the time it leaves the tank heater and the time it reaches the burner. This heater is essentially a steam jacketed oil pipe. Through the centre there is a 7 ft. length of $1\frac{1}{2}$ in. pipe, connecting at the right end through a tee to the oil tank main, and at the other end to the oil burner pipe. Encasing this, there is a 6 ft. 2 in. length of 3 in. pipe, attached to the inner pipe at the left end by a 3 to $2\frac{1}{2}$ in. reducer, with a $2\frac{1}{2}$ in. bushing tapped $1\frac{1}{2}$ in. to receive the inner pipe. The other ends of the two pipes have a packed gland connection to permit of any variation in length between the inner and outer pipe lengths from unequal expansion. This packed connection is similar to that of the other end, except that the bushing, instead of being internally threaded, is bored to receive the outer diameter of the $1\frac{1}{2}$ in. pipe, and counter bored for packing, which is forced into the space with a $2\frac{1}{2}$ in. pipe cap bored the $1\frac{1}{2}$ in. pipe size. Steam

Fig. 4. Heater for Maintaining the Oil in a Fluid State.

through its length. The raising of this rod from the supporting pipe gives the fireman the required knowledge.

Reference to fig. 1 shows the arrangement of the oil burning apparatus as applied to the fire box. Oil from the tank passes through a $1\frac{1}{2}$ in. McLaughlin flexible conduit, and on through similar piping to an oil heater and thence to an oil control valve near the oil burn-

ers the annular space around the inner pipe through a $\frac{3}{8}$ in. steam connection in the right reducer, and the condensation is drawn off through a $\frac{3}{4}$ in. pipe connection at the other reducer, this latter pipe being controlled by a $\frac{3}{4}$ in. globe valve. The steam pipe has a by pass connection into the end of the inner pipe, provided for the purpose of blowing out any dirt accumulation that

may gather inside this oil space. It is controlled by a blow out valve.

The "superheated" oil passing on from the heater, is controlled by an oil feed or firing valve near the burner. The form of the valve, as shown in fig. 5, closely resembles a plain taper turn cock, the main point of difference resting in the shape of the passage through the inner or turning part. Of necessity, the

Fig. 5. Feed Valve for Close Adjustment.

valve, to be efficient, must be capable of a very close control, and this has been obtained in a very satisfactory manner by making the inner passage triangular in section, so that the supply may be regulated within very close limits, especially when under light operation, the oil flow being concentrated in the tip of the triangular passage.

The arrangement of the oil valve control mechanism may be seen in fig. 1. A horizontal oil control rod on the end of the valve lever connects with a lever on the lower end of a vertical shaft at the rear left hand corner of the fire box, on the upper end of which there is the regulating quadrant in fig. 6. This quadrant has a 90 deg. throw, with a notched engaging surface into which the engaging pin in the handle grips. This lever is connected to the vertical rod referred to, by a squared end fitting a corresponding opening in the handle, the whole being pinned together. Near the notched rim of the quadrant on the "closed position" side, there is a short circumferential slot, in which a block may be clamped in the position desired. As shown by the detail of the stand by block and catch, the handle contains a spring plug that engages in the notch in the upper end of the clamped block, but which at the same time may be moved past the catch when desired. When the locomotive is standing by at a terminal or for any protracted period between runs, a small sustaining flame is all that is required, just sufficient to keep the flame burning. This position is first determined, and the block in the quadrant set, so that the fireman can almost automatically set the valve in the stand by position with a consequent saving in fuel oil.

Experiments have shown that the best types of burner for locomotive use are those using a wide, flat flame, with the oil supplied at low pressure. In this particular, railway practice differs from stationary practice, for, in the latter, it appears to matter very little what shape the flame assumes. The wide, flat flame is here desirable so that the whole interior of the firebox may be completely lapped by the flame. Better combustion is also to be had with a low pressure from the oil with an outside mixing type of burner. With the inside mixing type of burner an oil pressure in the tank must be maintained if the best results are to be obtained from the combustion of the oil. This has been tried in locomotive practice, maintaining a pressure in the tank with compressed air. Satisfactory results were to be had from an oil burning standpoint, but the increased amount of trouble introduced in the auxiliary apparatus required to

maintain the air pressure in the tank, did not warrant its continued use, especially when equally satisfactory results were to be had with the outside mixing heater, in which the tank pressure is dispensed with.

The type of burner which is used on the British Columbia lines of both the C.P.R. and the Great Northern Ry., is the VanBoden-Ingalls, which is in use on the Southern Pacific lines. It is an outside mixer, and is shown in fig. 7. Oil entering the upper chamber from either the upper or lower pipe connection depending on the piping (the one not used is plugged), passes forward, dribbling down on a corrugated surface table at the front end, from which it is picked up by a jet of steam coming through a thin wide slit in the lower chamber, the steam in passing over the corrugated surface of the table atomizing the oil and spraying it over a wide area in the fire box. The steam enters the burner from the rear around the lower oil connection core. The burner is made of cast brass, as the porosity of cast iron makes it unsuitable, the steam penetrating the partition between the two chambers, causing the flame to act in an ir-

Fig. 6. Quadrant for the Fireman's Control of Feed Valve.

regular manner. The burner is carried in the forward end of the brick pan, projecting the flame backward as mentioned earlier.

The brick pan which replaces the old grate bar arrangement is made of 1/4 in. plate, and is attached to the interior of the fire box all around, some few inches above the mud ring, by cast steel brackets attached to the latter. This is a de-

ted through griddings in the sloping sides of the fire brick pan about 5 ft. from the burner. These griddings, one on each side, consist of a cast iron frame containing three rows of 4 1/2 in. deep openings to extend through the bricks about 2 ins. square, 8 in a row. These two draughts focus with the nearly horizontal fan shaped spray at nearly the same point.

Through the fire door there is also a small opening through which the flues may be cleaned by the fireman by the insertion of a small funnel containing fine sand, the draught drawing the sand into the flues, the sharp cutting edges removing effectively the oily carbon deposits that result from the use of oil as a fuel. This operation is performed by the fireman every few miles, depending upon the load.

The C.P.R. is equipping 90 locomotives with oil burning apparatus, these being of the following classes and general dimensions:—

Class.	No. in Class.	Type.	Heat. surface.	Grate area.
N-3	41	2-8-0	3,001	49.5
R-1	6	0-8-8-0	3,417	59.0
D-9	16	4-6-0	2,850	49.6
D-3	2	4-6-0	1,291	23.4
D-4	11	4-6-0	1,299	28.0
L-3	1	2-8-0	1,731	32.0
L-5	3	2-8-0	1,872	32.5
U-3	1	0-6-0	1,544	52.0
V-1	2	0-8-0	2,005	32.7
D-5	6	4-6-0	1,593	31.8
A-5	1	4-4-0	1,150	17.0

The balance of the 97 mentioned earlier are at the stationary pumping plants at 7 points along the line.

The oil for distribution through the oil burning area is to be received at Vancouver, where large storage tanks are constructed. Other tanks have been built along the line. At Revelstoke, there is one of 22,000 barrels capacity, while Kamloops, Field and Rogers Pass each have tanks with a capacity of 15,000 barrels. Smaller distributing tanks are located along the line, a 1,000 barrel one at Notch Hill, and a 600 barrel one each at Sicamous Jct. and Golden. At the larger storage points, there will be additional distributing tanks with necessary piping connecting with the larger storage tanks.

As in the locomotive tenders, the oil in the storage tanks requires heating for a free flow. This is accomplished by means of a gridding of crosswise steam piping in the bottom of the tank, resting on lengths of larger piping running

Fig. 7. The Burner for the Burning of the Oil.

sirable arrangement, as the rivets through the mud ring are thus left exposed where they can easily be got at for caulking.

Experiments conducted to determine the best point at which to bring in the draught of air that is to combine with the spray of oil have shown that the most satisfactory results are to be had when the air combines at a point where the spray comes to a focus some 5 or 6 ft. from the burner. In the installation under consideration, the draught is admit-

ted through griddings in the sloping sides of the fire brick pan about 5 ft. from the burner. The steam connection is at the centre.

The oil standpipe for the filling of the tender tanks which is shown in fig. 8 resembles the standard water column very closely. The pit in which the standpipe is located is of concrete, and is covered over at the top, with a cold air opening down through this decking to the bottom of the pit. Around the central length of extra heavy 8 in. pipe there is a heating jacket, 12 1/2 in. inside diameter, made of No. 22 galvanized

sheet iron, this annular space communicating at the bottom with the pit. A wall heater in this pit creates a current of warm air to pass up around the vertical pipe, the air entering cold through the 4 in. pipe. The discharge end of the standpipe is provided with an oil drip pan which can be swung clear while filling.

All the oil burning equipment, with the exception of the burner, which was purchased outside, was made in the company's Angus shops, Montreal, most of the component parts being constructed from standard shapes, plating and

Fig. 8. Oil Standpipe and Heating Arrangements.

pipings. The cost of fitting the locomotives out for oil burning is about \$800 each, which includes material as well as labor, but does not include the stationary plants. To change the locomotives back to coal burning would necessitate an entire new ashpan, costing about \$180, as it is now necessary to apply self-cleaning pans.

Adjustable Ventilators for Canadian Pacific Railway Refrigerator Cars.

A new type of adjustable ventilator for refrigerator cars has been invented at the C.P.R. Angus shops, Montreal, and has been applied to the cars built last year. So far, its application has been quite as expected in every particular, and, in all probability, this will be the type to be used on all C.P.R. refrigerator cars in future.

The accompanying four illustrations show the ventilator in its four different operative positions. The construction is quite simple, and is shown to the best advantage in fig. 1. Around the ice door opening in the roof of the car at either

this frame, there is a hood-shaped door that can swing down over the top of the wire screening about twice the depth of

attachment that in no way interferes with the old arrangement. When a considerable volume of air is

Fig. 1—Ventilator opened for Ice Filling.

frame, the sides fitting closely over the edges of the frame. Near the front of this hinged cover, there is a frame of

required to circulate through the ice chests into the car, the ventilator is swung over into the position in fig. 2,

Fig. 2—Flap up to give Maximum Ventilation.

the front part of the swinging cover, and which is hinged to the cover as shown. This comprises the complete mechanism

with the hinged screen on the cover swung into its vertical position. On the front end of the cover there is a swing-

Fig. 3—Flap down to give Minimum Ventilation.

of the ventilator.

The ventilator is shown open for ice filling in fig. 1, which indicates in what

ing flap, which for maximum ventilation is swung up as shown in this illustration.

For a reduction in the amount of ventilation, this end flap may be lowered into the position shown in fig. 3. The ventilating opening is thereby reduced to the small opening under the bottom of the flap. Intermediate amounts of ventilation may be obtained by varying the amount of this opening by means of raising or lowering the flap into the desired location.

To completely cut off all ventilation, the screen door in the cover is swung up flush with the top of the cover and there secured by the lugs shown in the centre of the swinging door in fig. 1. This permits the swinging door to come down flush on top of the hole framing into the position of fig. 4, where it can be secured as indicated.

This new type of ventilator permits of a wide range of ventilating currents of air for different classes of perishable freight under the varying climates to which the cargo is subjected during its transportation.

Fig. 4—Ventilator Closed and Clamped Down.

end, there is a metal frame on all but one side, viz., the end towards the end of the car, which is open nearly flush with the decking. Hinged at the rear of

a simple manner the ventilator may be applied to old refrigerator cars, as no change of design is necessitated in the main structure, the new device being an

Railway Mechanical Methods and Devices.

Punch for Ripping Frogs at Central Vermont Railway Shops.

Ripping up worn-out frogs in the blacksmith shop, or in the switch and frog shop at large railway centres, would seem to be one of the least sought after of the many repair jobs arising in such shops, judging from the expression of opinions obtained from the foremen. The large unwieldy members are most difficult to handle from their awkward shape.

J. Martin, Foreman Blacksmith in the

Punch for Ripping Frogs under Steam Hammer.

C.V.R. shops at St. Albans, Vt., experiencing these same difficulties in the repair of frogs, cast about for some better means of ripping them up. The method he devised is very simple, and it is strange that it has not been put into more general practice. A punch of the form shown in the accompanying illustration is the only special tool required, and even it is simply made, being forged from the end of a 2 in. square bar without any machining, in the same manner as that used in forming the various tools employed by the blacksmith. The upper end of the punch and also its face are squared.

The frog to be dismembered is placed upside down on the anvil of a steam hammer, the binding plate being thus uppermost. The rivets holding the rail parts on to this plate are in pairs, each side of the rail web. In consequence, were a single punch to be employed to drive out the countersunk rivets one at a time, there would be a sagging tendency on the side of the rail from which the rivet was being withdrawn, tipping the whole frog over on that side. Mr. Martin's method is to use the punches in pairs, holding them in tongs over the adjacent rivets on each side of the web. The blow of the hammer on the punch head is thus balanced on each side, with no tendency as before to tip over. A single blow of the hammer is sufficient in the majority of cases to knock out the pairs of rivets. The frog, suspended by block and tackle, is easily moved about into the necessary positions for the removal of each pair, so that it takes but a few minutes to completely rip up a frog for the scrap heap. The frogs for the most part, are rivetted together with $\frac{5}{8}$ and 11-16 in. rivets.

In the assembling of the new frogs, the rivets to be used are heated by a method that while not exactly new, is used in so few shops as to be worthy of

mention. Occupying the whole of the flame section of the forge fire, there is a grid plate, filled with rivet size holes closely spaced. Down through these holes the body and end of the rivet project, the head resting on the plate. The part to be heated the most is thereby exposed to the heat more than the head. A great number of rivets can be heated at a time.

Testing Coach Springs at the Michigan Central Railroad Shops.

Springs for railway coaches are made with a wide variation in carrying capacity, and in the majority of shops, no definite or accurate tests are made on the completed spring to determine whether or not it will stand up under the specified conditions of service, the determination in the repair shop being more or less a haphazard one.

Generally, some approximate method of testing is adopted. That in former use at the Michigan Central Rd. shops at St. Thomas, Ont., is interesting. The completed springs, after being inserted in place under the car, were subjected to a load by having a gang of men get into the car and cause it to sway from side to side, the free space between the springs being noted during the operation. This approximate method, while

Air Press with Double Reading Gauge for Testing Coach Springs.

by no means determining the full capabilities of the spring, gave a fair indication of its reliability to stand up under actual service conditions.

It remained for J. Mitchener, Coach Shop Foreman, to devise a more reliable device which at the same time is simpler and handier. This tester is shown in the accompanying illustration. The method of testing the springs is as follows:—The end of the coach for which the springs are intended is first raised by means of two air jacks, one on each side, so that each jack carries exactly the same load as the spring. In order that the air pressure under each jack may be absolutely the same, resulting in each side rising uniformly without

swaying movement, the two jacks are joined by a tee connection to the same air valve, making the air pressure absolutely the same in each. A pressure gauge in the tee connection gives the air pressure required to raise the car. Knowing the area of each jack plunger, the weight of one quarter of the car, i.e., the weight to be carried by each spring, is determined.

In order to test the springs under this load, without placing them under the car, as in the former manner, the air press shown in the illustration was made. It is a simple air cylinder and plunger with necessary piping for the air, the whole device being rigged up in the shop, a good portion of the make-up consisting of old parts. The spring to be tested is placed on the table, and the plunger forced down on it, the air gauge registering the actual pressure of the air. This gauge has a double reading—pounds per square inch, and total load; the latter is a factor of the former on account of the plunger area forming a uniting constant. Thus the actual load on the spring may be directly read on the gauge. When the desired load (corresponding to that determined by the jacks) is applied, the free space in the spring is measured, and if it is as required by specification, it is passed. As a rule, 3 ins. is the required free space. The spring, after this test, is ready to be placed in position without any further work.

Tie Plug Forming Machine in the G.T.R. Montreal Shops.

A wood working machine for forming tie plugs in quantities is in operation in the G.T.R. shops at Point St. Charles, Montreal, J. Hendry, Master Car Builder, which was devised by one of the workmen in the wood working department. The plugs as formed are shown in the accompanying illustrations, and also the machine in two stages of operation.

Vast quantities of tie plugs are annually required on such a large system as the G.T.R., and to produce them in the manner followed at many points, by taking a piece of stock of the correct dimensions and pointing the end with a hatchet, and then cutting off to length, would require several workmen constantly employed, increasing labor charges, with an additional increased cost for stock from the fact that it

Fig. 1—Tie Plug from Tie Plug Forming Machine.

would require to be of the proper dimensions before coming into the hands of the workman. With this new machine, 25 plugs are produced at a time from a 4 x 4 in. piece of stock as rapidly as the operator can adjust the stock and operate the machine. The daily capacity of the machine runs up to nearly 100,000 plugs. It is the practice of the shop to operate it for some three or four days until a considerable stock has been formed to draw on, and then dismantle it until such time as a further stock is required. For those who do not know the use of these plugs, it might be mentioned that they are used for filling up the holes left by the rail spike when it is withdrawn for re-driving in a more solid

portion of the tie when the section hands are repairing the alignment of the tracks. The exposed hole must be plugged if the subsequent decay of the tie at that point is to be retarded as much as possible.

Fig. 1 outlines the shape of the plugs. They are constructed usually of soft pine although at times the harder woods are employed for that purpose. The body of the plug is 11-16 in. square, tapering on two sides at one end with a 60 deg. slope to a $\frac{1}{4}$ in. point. The customary length is from 4 to 5 ins.

The machine in two stages of operation is shown in figs. 2 and 3. Essentially, there are three sets of saws operat-

tical slotting completed, this saw carriage is raised to its highest position. The operator then moves the stock carriage along the ways, meeting first the gang of four saws revolving in the horizontal plane, which slots the stock at right angles to the previous cut. Continuing the forward movement of the stock carriage as in fig. 3, the single saw cuts off the finished plugs, thus completing them in batches of 25. The carriage is then drawn back, the stock loosened and pushed forward as before to the stop, and the operations repeated. The capacity of the machine is limited only by the speed and dexterity of the operator

Stand for Air Motor Used by Pere Marquette Railroad.

The Pere Marquette Rd.'s mechanical department has devised a neat little scheme for bearing the weight of the air motor while the latter is tapping holes vertically upwards, as, for example, when tapping staybolt holes in the fire-box crown sheet. As the illustration shows, the body or main part of the stand consists of a piece of 4 in. pipe, A, about 2 ft. long, having two wrought iron caps screwed on the ends. The cap to the right serves as a stand, while that to the left is longer and bored out to act

Fig. 2—Tie Plug Forming Machine Ready for First Cut.

Fig. 3—Tie Plug Forming Machine Cutting off Finished Plugs.

ing in three planes at right angles to each other. The gang of saws to the rear in fig. 2 is carried on a horizontal shaft operating in bearings on a carriage that can slide vertically on the post to the rear. This carriage is kept normally in its upper position on the guiding ways by a counterweight at the rear of the carriage post, and is lowered by the operator by the cross lever at the top, on which the operator in the illustration has his hands.

On a stationary shaft immediately in front of the rear side of these last saws there is a further gang of four saws revolving in a horizontal plane. To the rear side of this gang there is a single stationary saw revolving in a vertical plane at right angles to the first gang of saws, supported near the outer end of the cross frame of the machine. On this cross frame there is a carriage on which the wood stock to be operated upon is clamped with the quick-acting clamps shown. This carriage for carrying the stock is operated along its guides by means of the large hand wheel below the operator at the rear through gears engaging a rack on the lower face of the carriage.

The operation of the machine is as follows:—With the rear gang of saws in their highest position and the stock carriage at the rear of its travel, the stock piece is pushed under the clamps against a stop on the vertical carriage at the rear, which may be noticed below that carriage under the rear gang of saws in fig. 3. When the stock is located endwise against this stop, and against the rear face of the carriage, the clamps are brought down on it. With the stock carriage in this position, the upper gang of saws is brought down through the stock, the four saws slotting the end of the stock into five sections. In the separating washers between these four saws, there are projecting cutters to give the 60 deg. bevel to the ends of the plugs of the shape indicated in fig. 1. The ver-

The diameter of the saws of the upper gang is greater than the depth of the cut to the inner bevelling cutter requires, so that the saw cut enters into the next section of the stock end. The reason for this is obvious, making it possible to continue the sharpening of the saws to a considerably smaller diameter than they originally had, without in any way affecting their usefulness.

A further improvement to the machine is in contemplation. Pulling the

as a plunger guide. Inside the 4 in. pipe casing there are two springs, B and C, formed of $\frac{1}{4}$ in. steel, and coiled to give a free length a few inches in excess of the length of the casing. Resting on these springs is the plunger D, guided in the upper head as before mentioned. The plunger D has a No. 4 Morse taper holding the socket E, various lengths of which can be made to accommodate the different jobs that must be undertaken, or else the one average length

Stand for Supporting Air Motor while Tapping.

vertically operating saw carriage at the rear up and down all day, as is being done in fig. 2, is fatiguing to the operator. To relieve him of this arduous part of the work, this carriage is to be power operated by means of cone clutches on one of the shafts when thrown into engagement revolving a vertical threaded lead screw for raising or lowering at will. Double cones will make it power operated in both directions.

J. J. McDonald, a G.T.R. conductor, was arrested in Toronto recently on charges of defrauding the company of fares, etc.

The Timiskaming and Northern Ontario Ry. commission has announced that it has adopted the ruling of the Geographical Board of Canada, as to the spelling of Timiskaming, and in future the name as referring to the railway will be so spelt, the folders, stationery and rolling stock being changed to correspond.

may be blocked up to the job in an improvised way. These sockets E, are also given a Morse taper No. 4, to hold the head F, which is threaded on its outer end to fit the handle end of the motor. The motor, being screwed on to this head, forms a solid and rigid unit, guiding the tap accurately into the hole.

All who have had difficulty from imperfectly fitting staybolts, due to the hole being ovalled from incorrect tapping by the old method of having the workman support the motor, will appreciate the value of this idea. In addition, the spring being of medium strength, keeps the tap right up into the hole, materially reducing the tendency of the tap to strip the thread before gripping. Consequently, a more perfect thread, less liable to leak, is made possible.

The Central Railway and Engineering Club, Toronto, held its annual outing recently, to Erin, Ont.

Remodelling of the C.P.R. Place Viger Station and Yards, Montreal.

Most of the work of remodelling the C.P.R. Place Viger station and yards with a view to increasing their capacity and making them more convenient, has been completed, and the new arrangement in the immediate proximity of the station is shown in the accompanying plan. The new arrangement of the terminals and trackage is shown solid, and the old arrangement, now replaced, is shown dotted.

Formerly, the tracks entering the terminals from the right along the water front, branched off at an angle of about 45 degs. into the station yard, this arrangement taking up a great deal of ground without the best utilization of the space occupied. The station tracks were likewise not at all convenient to the waiting room. The freight shed space to the south, below Notre Dame street, was also very much cramped, and was not utilized to the best advantage, from the fact that most of the tracks were short spurs.

When the excavation had been completed, tracks were laid from the east end of the yard towards the then existing tracks, from which the traffic was then diverted. The old tracks being removed, the new ones were extended to the station building extension, which projects south from the old combined station and hotel. The station is now entirely separate from the old building, which is used solely for hotel purposes.

In the passenger terminals there are 10 tracks, with 10 platforms, accommodating 80 cars. A four track car storage yard provides for 48 more. Between the car storage tracks and the Notre Dame street bridge there are four freight tracks with a capacity of 83 cars, used for team freight. Under the bridge there is located a long 2 story shed for freight and fruit. This shed is served by a roadway on the north side and trackage on the south, which becomes a part of the new freight yard with terminal sheds at present under construction to the south of the bridge. This 2 floor shed under the bridge is used for bonded freight. It is 300 ft. long, and has windows and continuous sliding doors on the track side, and 20 separate

The Diesel Locomotive.

In a recent address before the American Society of Mechanical Engineers, wherein he described the progress being made with the acceptance of the Diesel engine as a standard means of developing power, Dr. Rudolph Diesel, the inventor of this type of internal combustion engine, described a locomotive constructed the early part of this year in Germany in which the Diesel engine is the motive power. The locomotive in outward appearance closely resembles an all-steel car, and weighs 85 tons. The wheel arrangement is of the 4-4-4 type, two Diesel engines set at an angle of about 45 degs. at the centre of the car driving on to a jackshaft between the two pair of drivers, this jackshaft being the crankshaft of the engine. Connecting rods from the jackshaft drive the driving wheels. Between these two inclined cylinders, there are two scavenging air pumps driven from the same shaft. Two horizontal air cylinders on the floor in front are driven from two small vertical Diesel engines, this com-

Old and New Arrangements of Terminal Facilities at C.P.R. Place Viger Station, Montreal.

The plan of enlargement made a radical change in the terminals, it being determined that the best arrangement under the circumstances would be to bring the tracks in parallel to Notre Dame and Craig streets, for which purpose considerable property surrounding the yards had to be purchased, the extent of this land absorption being indicated by the dotted blocks in the illustration.

Notre Dame street originally ran along the crest of a rise in the ground parallel to the shore line, between the shore line and Craig street. In the old arrangement, the tracks came through from the shore line to the Craig street level by cutting through this mound, and carrying the highway across on a bridge. The new arrangement necessitated the reduction of the ground level over the whole area of the new terminals, to the level of the former trackage, so that Notre Dame street is now carried across the lowered yards on a viaduct, beneath which are freight sheds. Notre Dame street was temporarily diverted while the excavation work was being pushed forward. The street on the viaduct is at practically the same level as before.

sliding doors on the team side. The sides are galvanized iron, supported on a steel frame. The fruit shed at the west end of this freight shed is built under the old portion of the bridge, and is heated, so that fruit shipments can be properly handled both winter and summer.

The freight yards to the south of the bridge, which are now nearing completion, will contain long freight sheds parallel to the street, occupying the ground right down to the Harbor Commissioners' property, the whole yards occupying a space nearly three times as great as that portion shown in the illustration above Notre Dame street.

W. J. Chapman, formerly assistant timekeeper at the C.P.R. freight sheds, Fort William, Ont., has been charged with the theft of \$1,017.51, by means of irregularities in the pay rolls. He was arrested in San Francisco.

H. W. D. Armstrong, M. Can. Soc. C.E., Chief Engineer, Fredericton and Grand Lake Ry., Fredericton, N.B., writes,— "I must congratulate you upon the increasing volume and value of the Canadian Railway and Marine World."

pressed air being used to increase the power of the engine by increasing the area of the indicator diagram, the process being new. The air is stored in cylinders near the other end of the car, where are also located the cooling water tanks. A large muffler in the top of the car subdues the blast of the exhaust.

Dr. Diesel gave what in his opinion are some of the reasons for the slow adoption of the Diesel engine in America. The causes assigned include cheap coal, cheap engines, lack of capital, and generally good profits without undue thought concerning economy. These reasons stand out prominently in comparison with Europe with its world competition.

An obstacle to the use of the internal combustion engine for hauling trains has been the impossibility of accelerating the train from standstill with an engine of normal size and of maintaining any considerable overload at any speed. A petroleum electric locomotive is now proposed, in which the prime mover is an internal combustion engine, using crude oil, kept continuously running to drive an electric generator, which in turn delivers electrical energy to four 220 h.p. polyphase motors.

The Construction of the National Transcontinental Railway.

Figs. 1 and 2. Map and Profile, National Transcontinental Railway, Moncton, N.B., to Winnipeg, Man., 1,804 miles.

In 1902 a company was formed in Quebec to build a railway from Atlantic tide-water, on the Saguenay River, to Port Simpson, on the northwest coast of British Columbia. The line was to be known as the Trans Canada Ry. In the following winter, three parties were placed in the field, one at either end, and the third party north of Lake Winnipeg. Several hundred miles were surveyed and some knowledge of the character of the country was obtained. Early in 1903, the newly formed Grand Trunk Pacific Ry. Co. took over the scheme and the parties were recalled. A new and more southerly route was then projected, extending from Winnipeg westerly to Edmonton, and thence to some undetermined point on the Pacific Coast, and easterly from Winnipeg to a junction with the Grand Trunk Ry. at North Bay, on Lake Nipissing.

This easterly division swung north along the waters of Lac Seul and the Ogoki River as far as the 88th meridian before turning southeast. It penetrated a country little known, and uninhabited except by a few scattered families of half-starved Ojibways. A reconnaissance was made over the whole route as projected, which included a branch from Lac Seul to Fort William, on Lake Superior. Ignorance of the country, shortness of supplies, lack of transport facilities, and outbreaks of scurvy were among the difficulties with which the parties had to contend. A few caches had been established at isolated points, but, for the most part, supplies were brought in with the parties and replenished from the nearest fur-trader's outpost or Hudson's Bay Co. post.

In 1904 the Dominion government appointed the National Transcontinental Railway Commission to take over and build the line from Moncton, N.B., to Winnipeg, Man. The Grand Trunk Pacific Ry. is building west from Winnipeg to the Pacific Coast and will operate the entire line from Moncton, N.B. Under this commission the route of the eastern division was again changed and a year was spent on new surveys and the study of those already made. It was then laid out to skirt the north shores of Lakes Nipigon and Abitibi, continuing in the same general direction to the headwaters of the St. Maurice River, crossing the latter near Quebec, and proceeding thence in as direct a line as possible, without leaving Canadian territory, to Moncton, at the southeastern corner of New Brunswick. There it connects with the Intercolonial Ry., which is owned and operated by the Dominion Government and which extends to the Atlantic ports of St. John, N.B. and Halifax, N.S.

While contracts were let and construction was commenced at Winnipeg and Quebec as early as 1906, final location through the remote districts of northern Quebec and Ontario was not completed until late in 1908, and revisions have since been made from time to time. Before the most economical location was staked out, before even a satisfactory line could be projected, an enormous belt of country had to be explored and mapped. From Lake Nipigon eastward to the St. Lawrence valley, two main routes were selected for exploration. The one eventually adopted has been described above. The other followed a more or less direct line, passing close to the south shore of Lake Abitibi, touching the north end of Grand Lake Victoria, an expansion of the Ottawa River, and proceeding thence across the Gatineau and Lievre Rivers to the Mattawan and St. Maurice. An alternative route in New Brunswick, by the St. John River valley, was also surveyed.

The total distance from Moncton to

Winnipeg was estimated to be about 1900 miles, on what was assumed to be the most direct feasible route. The problem of definitely locating this route was not an easy one, as for more than half the distance the line of general directness ran through an unsurveyed, unsettled and practically unknown region cut up in all directions with a network of lakes and rivers, many of them not shown on any existing maps, and when so indicated, often found to be entirely misplaced. The engineers, had, therefore, in many cases to make their own maps, as the surveys proceeded, and had in all cases to correct and complete existing maps.

SURVEY WORK AND LOCATION.

During the autumn of 1904 and the following spring, some 34 survey parties were equipped and sent out, and before the end of 1905 there were 45 parties in the field, consisting of about 18 men each, not counting a large number of men engaged in transporting supplies by canoe and packing in summer and by dog train in winter. Each survey party had an engineer in charge, transitman, leveller, topographer, draughtsman, rodman, picketman, two chainmen, cook and eight or nine axemen and packers. Each party was given certain governing points to connect, and was instructed to thoroughly exhaust the possibilities for the most favorable and reasonably direct line between these points. Barometric explorations and compass lines were followed by preliminary lines run with transit, and plans were plotted with 10 ft. contours on a scale of 400 ft. per in.

With those plans, and with profiles on the same scale, projected locations were made on the most favorable lines and afterward actually run on the ground and called a "first location." These plans and profiles were plotted in the field, and tracings (with reports) were sent to headquarters monthly. These reports were carefully gone over by the Chief Engineer and Assistant Chief Engineer, necessary changes suggested, and instructions issued accordingly. Whenever the head of a party completed what he considered the best possible "first location," the engineer in charge was changed and another man given a chance to improve the line by making his best attempt at a revised location. The original head of the party, or a third man, was given a chance to still further revise for a final location. In this way it was found that a healthy rivalry was established and good results obtained. Revision of location is, however, never considered as finished until construction is well under way, as it is often found, after the line is cleared, that slight changes will effect a very considerable saving.

An equation table giving definite values for savings in distance, curvature, rise and fall, etc., was furnished all parties in the field, so that, having the estimated cost of construction of any two or more lines, the better one to adopt from all points of view could be at once determined. This table is given further on.

The earlier explorations and reconnaissances were made by compass and barometer, followed by transit with stadia, or chain and level. Steel-band chains were used for distances in final location. The parties consisted usually of 18 men in settled districts to 24 men in unsettled districts, six of the latter number being packers. In general, they were sent into the field in pairs, at intervals of about 80 to 150 miles, with instructions to run, respectively, east and west from some more or less well defined point. In the more remote localities, it was found impossible to fix these points at all accurately, owing to the non-existence of reliable maps; nor could the course of the indicated route be followed closely owing to the presence of some unsuspected large body of water or other topographical obstruction. Consequently, much difficulty was encountered in joining up

the surveys of two approaching parties. At the head of the St. Maurice, the Tete de Bulle Indians were found to possess an unusual aptitude for cartography, and by following their rude maps, a junction was effected with the party running east from the Gatineau.

Working in a country so cut up with lake and river expansions as to be more than 50% water, absolutely unmapped and unknown, and some 250 miles from the nearest railway, two parties overlapped several miles, one being 10 miles north of the other, before communication was established between them and a connection made. A rough stadia traverse, 80 miles long, following the old Indian canoe route from Lake Abitibi to the Kenojavis River, and occupying 11 days, furnished course and distance between surveys which had started nearly 200 miles apart. In the Kenogami District, one of the earliest G.T.P. Ry parties exhausted their provisions, and searched three days without finding a line, which had been blazed north from a supply cache, to which they tied in their reconnaissance. They left behind them as a record of their experience a string of lakes bearing the suggestive names: "Storm," "Ice," "Poverty," "Stampede" and "Relief." By discharging ship's rockets simultaneously on a pre-arranged night, quick connections were in several instances effected across unsurveyed gaps.

Observations for latitude were made, of course, but as there were at the outset no means of intercommunication between the parties in remote localities, other than through the district head quarters, on the C.P.R., months elapsed before these could be interchanged.

VALUES FOR EQUATING DISTANCE, ETC., IN LOCATION.

It has been noted above that field parties were furnished with equation tables showing definite values for savings in distance, curvature, etc. The values given below were used in the final determination of location. Tables 1 and 2 give the values for distance and rise and fall. For calculating the justifiable expenditure per mile, 10 daily trains each way (equal to 20 daily trains) were assumed for the line between Moncton and Quebec, and also between Winnipeg and the junction with the branch to North Bay; between other points 12 daily trains were assumed. Justifiable expenditure per mile takes into consideration maintenance of rails, ties, ballast, etc.

TABLE 1.—VALUE FOR EQUATING DISTANCE.

Class.	Value per ft. per daily train	Capitalized value per daily train per ft.	Saving per daily train Justifiable expenditure per mile of saving in distance
A	0.30	2.0c.	\$0.50
B	0.50	3.4c.	0.85
C	0.60	4.0c.	1.00
D	1.00	7.0c.	1.75

*Capitalized values per mile to nearest \$100 and interest 4%. One daily train each way equals two daily trains.

- A. Distances so short as not to affect track or train wages, aggregating less than two miles.
- B. Distances affecting train wages, but not so great as to affect the number of stations or sidings. From two to five miles.
- C. Distances so great as to affect number of stations and sidings required. From 5 to 75 miles.
- D. Distances so great as to affect number of engine districts. Over 75 miles.

VALUES FOR EQUATING CURVATURE (ALL Trains)—The elimination of 1° of curvature will save 16c per daily train per annum (including passenger and freight trains); equal to a capitalized value of \$4 per degree. Justifiable expenditure per degree of saving in curvature; \$48 for 12 and \$80 for 20 daily trains. If a curve is in a particularly dangerous place, which necessitates a watchman or other additional expense, the value of its elimination must be considered separately. One degree of curvature means one degree of central angle, regardless of radius of curve. It is assumed that expense due to curvature is in proportion to the total central angle.

ASSUMED COSTS PER FREIGHT TRAIN MILE, Engine Mile, Etc.—Train mile, \$1. Engine mile, .35c., both assisting and running light; 40c. if assisting both ways, with no light running. Minimum cost for assistant engine when not at division point or used for yard work, \$18 per day or \$6,600 per annum. Light running 25c. per engine mile. Switching 30c. per engine mile. Doubling grades, 90c. per engine mile straight distance, or 45c. per additional engine mile.

TABLE 2.—VALUE FOR EQUATING RISE AND FALL (ALL TRAINS).

(Freight train velocity limits: max., 30 m.p.h.; min., 10 m.p.h.)

Class	Value	Justifiable expenditure per ft. of saving in rise and fall for
A. Minor grades ..	\$0.12	12
B. Minor grades ..	0.48	20
B. Ruling grades ..	0.88	24
C. Minor grades ..	1.00	26
C. Ruling grades ..	1.40	30

A. All rise and fall up to 30 ft.
B. Where grades require shutting off steam, but not application of brakes in descending. This class includes all rise and fall of over 30 ft. on grades less than 0.6%, and between 30 and 100 ft. on 0.6% grades and steeper grades of small drop not covered under Class C.

C. Where grades require the application of brakes and shutting off steam in descending. This class includes all rise and fall of over 100 ft. on grades of 0.6% and a proportionate fall on steeper grades.

VALUES FOR RAILWAY GRADE CROSSINGS—Justifiable expenditure to save one normal grade crossing of another railway, \$40,000.

TRANSPORTATION AND SUPPLY.

Much of the early organization had to do with transport and supply problems. Through New Brunswick, Manitoba and the settled portions of Quebec existing railways, roads and steamship lines gave easy access to all parts of the line. LaTouche (at the head of navigation on the St. Maurice River), St. Gabriel, Maniwaki and Kipawa (terminals of the C.P.R. branch lines), and North Timiskaming, at the extreme end of the lake of that name, were the points of departure from which radiated canoe routes to the vast wilderness of northern Quebec. Between Lakes Nipigon and Abitibi, the Moose and Albany Rivers spread their

finger-like branches southward to within short distances of the C.P.R. main line, furnishing water routes which were reached by canoe and portage from Bisco, Woman River, Chapleau, Missinabi, Grasset, Montizambert and Heron Bay. Lake Nipigon affords comparatively easy access to a hundred mile stretch across its northern drainage area; while to the west, Ignace, Dinorwic, Dryden and Kenora were used as shipping points to Sturgeon and Minnetaki-Lakes, and the Wabigoon and Winnipeg Rivers.

In the autumn of 1904 and winter of 1905, from 40 to 50 completely equipped parties were placed in the field between

Moncton and Winnipeg. Some of these hardly reached their destination before being overtaken by the freeze-up, and were forced to return and cut trails in order to bring up sufficient supplies to carry them over the winter. A transport department was organized, and as soon as the condition of the roads and lakes permitted, large quantities of provisions and outfit were pushed north to the furthest limit of lumbering operations over existing bush roads, and stored in main transport depots, or in warehouses of the Hudson's Bay Co. From these, part of the supplies were forwarded by dog sleigh and packer, and the balance distributed by canoe after the ice had gone out in the following June.

Caches were established from time to time at intervals of from 20 to 40 miles; log shacks were erected and a couple of men placed in charge of each. These were generally located on some canoe route, and being maintained permanently, as long as the surveys lasted, constituted an important aid in their prosecution. Regular systems of mail service were provided later, following the supply routes, but during the long freeze-up, lasting from about the middle of October to the middle of December, and to a less extent throughout the break-up, extending over the greater part of April and May, insecurity of ice on river and lake practically put a stop to communication with the outside world. Throughout most of Quebec and western Ontario, innumerable waterways, many of them rendered navigable for canoes by beavers, provided an easy method of moving camp. But across the interminable muskegs and spruce-covered swamps of the clay belt, parties had in summer to depend solely on the tump line to pack their supplies and outfit.

Medical officers were stationed at wide intervals, but there was little sickness that could not be cured by a blue pill. The most serious discomforts endured were black flies in summer, and a few intensely cold days in midwinter when the mercury sometimes touched 60° below zero. Accidents due to upsetting canoes and breaking through ice were unfortunately, too common. In the first three years of the survey, 27 lives were claimed by the frigid waters of river and lake, at that time the only highways. Narrow escapes were of almost daily occurrence. On several occasions, parties were caught by the freeze-up on their way out, canoes being abandoned, and treacherous river crossings negotiated on hands and knees. Two men tried to run a 30-ft. chute on the Gatineau. One jumped on to a rock, and the other was rescued with difficulty from the pool below after the canoe had been dashed to pieces. Another canoe broke in half while descending the Woodchuck rapids on Bell River, and the occupants paddled five miles into camp seated one in either piece.

GRADES AND ALIGNMENT.

At the outset it was decided that the railway should conform to a high standard. Grades were not to exceed 0.4% opposed to eastbound traffic (which is the heavier), nor 0.6% against westbound traffic. The curvature was limited to 6°, and all curves of 1° and over were connected to their tangents with easy spirals. The 6° limit for curves was used only where topographical conditions prevented easier curves being used at reasonable cost. Grades were compensated for curvature at the rate of 0.4% per degree, so that on 6° curves the maximum grade (eastbound) was 0.16%. Vertical curves were introduced at summits and sags, the rate of change in grade being 0.1% and 0.05%, respectively.

Pusher grades were adopted at two points only and are quite short. The whole line between Moncton and Winnipeg (with the slight exception of short approaches to the Quebec Bridge on 1% grades) was definitely located with the

above mentioned very easy maximum grades. But 146 miles from Moncton, it was found that by the insertion of about 12½ miles of 1.1% grade adverse to eastbound traffic, a saving could be made of 17.2 miles in distance, nearly \$2,000,000 in construction and \$1,250,000 in capitalized operating value. At another point (in Quebec) 286 miles from Moncton, a similar grade 10 miles long, adverse to eastbound traffic, was found to effect a saving of 18.8 miles in distance, about \$500,000 in construction, and over \$750,000 in capitalized operating value. These possibly temporary grades were adopted with the corresponding saving in distance and cost. If the future traffic of the road justifies the expense, these two short links of standard grade can be built at any time.

In comparing rival routes, values based on assumed capitalized cost of maintenance and operation were given to savings in distance, curvature, and rise and fall as noted above. Owing to the locality traversed, artificial values for these, due to competition, seldom had to be considered. Distance was evaluated at \$6 to \$35 per ft., depending on amount saved and expected traffic; curvature at \$48 to \$80 (or more) per degree; and rise and fall at \$36 to \$700 per ft. on long maximum grades requiring the application of brakes in descending.

Throughout the 1800 miles between Moncton and Winnipeg the geographical characteristics, and consequently the engineering problems, varied greatly. The short route across the broken topography of New Brunswick necessitated long stretches of maximum grade and development for distance, culminating on the slopes of the divide between the Miramichi and St. John Rivers. Even with a short pusher grade of 1.1% eventually adopted here, cost of construction was very heavy. This included a tunnel and 3918 ft. of viaduct, 193 ft. high, over the Little Salmon River. A pusher grade was also required to negotiate the summit between the St. Lawrence and Bay of Fundy waters, near the extreme northern corner of Maine. In southern Quebec, the line parallels the St. Lawrence River, 20 miles inland, before swinging north to where the substructure for the new Quebec Bridge is rapidly nearing completion. Just beyond, another great viaduct, 3000 ft. long and over 160 ft. high, was required to span the gulch of Cap Rouge. Three of the piers for this was sunk by pneumatic caisson, one to a depth of 55 ft. below high water.

LOCATION AND ROUTE NORTH OF THE ST. LAWRENCE.

Perhaps the most difficult problem confronting the locating engineers, on the whole eastern division, was to find a path through the forbidding range of hills loosely called the Laurentian Mountains, which forms the northern watershed of the St. Lawrence River. Some 80 miles west of Quebec city this range is abruptly cleft, enabling the St. Maurice River to carry south the accumulated drainage of 15,000 sq. miles. Three alternatives were proposed: 1, to develop a line up one of the more easterly streams until sufficient altitude should be attained to cross over into the St. Maurice valley and follow this to its upper waters; 2, to enter this valley at its lower end, cross it, and attempt to reach the hinterland by way of the Mattawin or Rivière aux Rats, two of its main tributaries from the west, or 3, to proceed further up the St. Lawrence, and pierce the Laurentian at some more westerly point, avoiding the precipitous cliffs of the St. Maurice.

All of these routes were explored. The third, apart from other objections, proved too long. The second and most direct was reported against on account of the excessive slope in the lower waters of the valleys explored, the difficulty of developing distance within their narrow confines, and the great cost of bridging

the lower St. Maurice. The approved route followed up the rivers Batiscaan and Brochet, until a pass was reached over-looking the hamlet of La Tuque, at the head of navigation on the St. Maurice, where the latter turns from south-east to south. The descent was effected by fitting a two-mile horseshoe curve into a recession of the hillsides.

Beyond La Tuque, the waters of the St. Maurice come down 80 miles from the old Hudson's Bay post at Weymontachene, dropping 700 ft. in a series of cataracts and turbulent rapids. Its course is fairly direct, except for a long detour to the north around the 16 miles of air line between the mouth of the Vermillion and Coocoo Cache. Four miles above La Tuque, the main river is bridged by six 140-ft. trusses, on concrete piers and the precipitous slide hill is followed to Vermillion. Here, after repeated efforts, a circuitous route through the long granite ridge was located in Coocoo Cache, and the St. Maurice again followed to Weymontachene.

From Weymontachene to the Gatineau River, the obvious route appeared to be via the Ribbon River, but a 10-mile saving in distance was effected across from its mouth to its upper basin. However, this involved two semi-loops, a 100,000 yd. summit cut and several others of slightly less magnitude. The first preliminary west of the Ribbon struck far to the north, via Haircutting Lake, avoiding the Gatineau valley altogether. Later the east branch of this was crossed and the sinuous line between interlacing waters of the St. Maurice and Gatineau roughly followed to where it intersects the height of land, 50 miles beyond.

Innumerable lakes and creek expansions, separated by irregular ridges of sand and boulders, covered with jack-pine, here constitute the outstanding features of the topography. So intricately interwoven are these, that the country had to be criss-crossed with lines for a width of 20 miles before a satisfactory alignment could be obtained, with a profile showing only moderately heavy work. Similar conditions prevailed for a further distance of 25 miles to the Atik River, which was followed to its junction with the Megiskin, a branch of the great Nottaway. This region was the most inaccessible and least known on the whole line, and will be the last to be completed.

While the St. Maurice valley was being explored from the Quebec end, engineers sent north from Ottawa, North Bay and western points, had made the unexpected discovery that the country beyond the height of land presented far fewer difficulties than that draining into the St. Lawrence. Accordingly, late in 1905 the route south of Lake Abitibi was abandoned.

The actual height of land is crossed three times in northern Quebec, and twice in northern Ontario, with elevations above mean tidewater of 1500, 1070, 1075, 1120 and 1260, respectively. At all of these points except the most westerly, the work is light. From the Megiskin River to Lake Nipigon, occurs a vast spruce-covered plain, of which the soil is a deep agricultural clay, interspersed with a few sand ridges and isolated outcrops of rock, and covered in many places by from 1 to 10 ft. of muskeg. That part east of Lake Abitibi (a shallow and muddy expansion of the Abitibi River, 400 sq. miles in extent) is intersected by the sluggish waters at the sources of the Nottaway and Harricaw Rivers. The western portion, on the other hand, is drained by swift flowing branches of the Moose and Albany Rivers, so numerous as to require a bridge on an average every sixth mile, not counting arch culverts up to 30 ft. span. These show on the profile as deep gulches, separated (except for an occasional long shallow cut) by mile after

mile of surface line within a few feet of subgrade.

The alignment throughout this section is exceptionally direct. For 250 miles westerly from Lake Abitibi, the length of preliminary location exceeded the air line by less than 4%; it contained only six curves of 3° and none over 3°. The first G.T.P.R. reconnaissance, run in 1903, between the Kenogami and Missinabi Rivers, was a straight line 115 miles long. On final location some of the very long tangents were broken up to obtain more favorable river crossings, but several stretches of 16 to 18 miles were retained.

North of Lake Nipigon, granite ridges alternate with flat stretches of muskeg and clay. These latter occur with decreasing frequency as the line crosses the height of land for the last time to enter the rock-ribbed and unproductive wilderness which forms the barrier separating the farm lands of eastern Canada from the prairies. With the exception of a short tract of indifferent agricultural soil, between Lost Lake and the Wabigoon River, the country is barren and desolate, much of it having been denuded even of its original growth of stunted spruce.

An enormous number of irregular bodies of water lie scattered over its surface, many of them with shores deeply indented, and buttressed by rugged cliffs. In the vicinity of Onamakawash Lake, along Canyon Lake, and on both sides of the Winnipeg River, the rock cuts were exceptionally heavy. Embankments of even larger size had also to be made of rock borrow and train-hauled material. Corresponding conditions prevail along the line of the C.P.R., and repeated surveys showed that no improvement could be effected by adopting a still more northerly route. The last 50 miles into Winnipeg is, for the most part, through settled prairie country. By crossing and keeping south of the C.P.R., the worst portion of the deep Julius muskeg, which required years to fill, was avoided.

CONSTRUCTION WORK.

Actual construction began in the spring of 1906, contracts having been signed for the building of 150 miles from Quebec west, and 245 miles from Winnipeg east. The latter portion was to a connection with the branch to Fort William (then under construction by the G.T.P.R.); thus giving a line from the wheat district to Lake Superior. From time to time additional sections were let, until by October, 1908, the whole line was under contract. Supplies for constructing the most easterly 850 miles were distributed from various points on the Intercolonial, Canadian Northern C.P.R. and other railways. The extreme western end was also easily accessible by steamer and short winter road from various points on the C.P.R. as far east as Dinorwic. The central portion was opened up east and west from La Tuque, the Timiskaming and Northern Ontario Ry., Lake Nipigon, and the Thunder Bay branch of the G.T. Pacific Ry.

Steel on the Quebec and Lake St. John branch was laid into La Tuque early in 1907. About the same time the T. & N. O. Ry. ran its first train into McDougall's Chutes at the head of navigation on the Black River, a tributary of the Abitibi. From here, two main transport routes were established. One extended upstream into Abitibi Lake. The other followed down the Black and Abitibi Rivers, to where the new line crossed the latter, beyond which a monorail tramway was constructed 8 miles across country to the Frederickhouse River. The tramway was operated by a platform truck having shafts attached to a pole at right angles to the rail. The horse thus walked alongside the car and rail, the car being guided on the rail by double-flanged wheels. A service of steamers and gasoline boats was established on each route, short stretches of light-rail tramway be-

ing built around the worst rapids. Push roads were also cut to provide winter communication. Later, when the T. & N. O. Ry. had extended its line 40 miles to a junction with the National Transcontinental Ry. (where the town of Cochrane now stands), the steel was laid east and west over the new grade, these routes were abandoned.

Meanwhile the G.T. Pacific Ry. had finished its branch from Fort William to Sioux Lookout, with a spur into Sturgeon Lake. This extended the field of operations, and gave impetus to that part required to connect Winnipeg with the Great Lakes. In the summer of 1908, a narrow gauge railway, 18 miles long, was constructed around the rapids of the Nipigon River, and before navigation closed that year, a considerable quantity of supplies had been distributed along the north shore of Lake Nipigon by steamers built for the purpose. In the following year an attempt was made to establish a similar transport route from Jackfish over the height of land, into Long Lake, and thence down the Kenogami River. This failed, owing to the inability to secure reasonable grades up the steep ascent from Lake Superior, except at prohibitive cost.

It was accordingly decided that the 350 miles between Cochrane and Lake Nipigon should be covered from either end. By Dec. 1910, 40 miles at the west end of this was graded and track laid for over 100 miles at the Cochrane end. Two months later a winter tote road was completed across the remaining distance, and sufficient supplies and outfit to grade all but a few cuts were distributed in log warehouses erected at intervals of about 20 miles.

GRADING.

As most of the work was of the lightest description, chiefly side casting, the construction plant consisted almost entirely of shovels and wheelbarrows, with a few tons of light rails, some car wheels and a load or two of explosives for loosening frozen clay, and breaking up boulders. This light work was practically finished by Oct., 1911, and up to the end of Feb., 1912, 20% of the balance of the excavation had been completed.

In the heavy rock districts work, of course, proceeded much more slowly. The usual methods of blasting were employed: 1, block holing, loading with dynamite and firing with time fuse, in the smaller cuts; 2, heavy springing, loading partly with black powder and discharging with battery in the larger cuts, or where it was desired to break up and waste several thousand cubic yards at once; 3, tunnel blasting, or "coyoting." For this latter work, the station man was usual paid per lineal foot for shafts and tunnels. In loading these, the high explosives were sometimes left in the case, but the blast was usually more effective if the cartridges were removed from the boxes. Frequently 6000 cu. yd. or more of rock were broken up by one of these blasts. Where the expense of bringing in cars and track was excessive, the shattered rock or muck was removed by stone boat on pole track, the poles being well iced in winter, or lubricated with black oil in summer.

Deep clay cuts in the Abitibi region were excavated with less expense in winter, as in summer horses could only travel in the greasy blue gumbo after the cuts (and often the fills as well) had been corduroyed. But in the winter, so long as the work progressed steadily, even in the coldest weather, the cut did not get time to freeze deeply in a single night, and the frozen top could be undermined or broken down with a few sticks of dynamite. A slight additional expense was incurred in winter by shovelling snow away from the base of the dump.

Much of the grading in New Brunswick and Quebec was performed with steam shovels having dippers of ½ yd. to 2½ yd. capacity. These were hauled

into the work in winter with their necessary complement of dinky engines, cars and track. Some of the smaller machines were similarly used in northern Ontario. Scrapers, both wheel and slush, were employed on the prairie section, and elsewhere generally for light sandy work, a few being sent in across Lake Nipigon. An elevating grader was tried in the Abitibi country, but was soon discarded, as the horses mired in the sticky clay.

SLIDES.

Slides were numerous throughout the clay belt. These occurred, to some extent, in the sides of cuts, which frequently required a slope of 1 on 2 or even flatter. Much more serious, however, were those which took place under deep fills and behind concrete abutments. At Brule Creek and the Okikodasik and South Rivers, heavy concrete structures on poles were moved bodily out of place, but the shifting from original position was not sufficient to prevent the erection of the steel superstructure after movement had stopped. In some instances it appeared probable that pressure behind the concrete had deflected the piles laterally through the yielding clay; in others, that the slip had occurred on an inclined plane below the level of the foundations.

At the little Mistongo, a long 6-ft concrete arch was built on pile foundation, and the deep gully bridged by a light trestle, from which material excavated in an adjoining cut was dumped. Some of this, in wet weather, simply flowed away in a river of mud. After several slides had occurred, which broke up and buried the culvert, sweeping three or four trestles in succession down the slope, the fill was completed in winter, a large square box culvert of heavy timber being built to replace the arch culvert. With the freshet, the embankment again settled, and a small lake formed on the upstream side, from the middle of which protruded one end of the timber culvert, standing upright. Continuous filling at length brought the embankment up to grade, the water being at first pumped and siphoned over the top, and later carried off through a reinforced concrete pipe built permanently through the bank and having a long extension at the downstream end.

BRIDGES AND CULVERTS.

On completion of the main surveys, small parties were sent over the line with instructions to take soundings where any openings were to be left. A light boring machine was used, by which casing pipe screwed together in sections was forced down through the river bed, and the core broken up with the drill, and removed by means of a rope attached to a short tube with ball valve. At the Manuan River, this machine was set on the ice, and the casing driven by an improvised pile driver, consisting of a section of green birch for hammer, working between leads and operated by transport dogs. When the ice went out the machine was transferred to a raft, and the dogs harnessed to the spokes of a windlass. By this contrivance, pipes were driven through 50 ft. of hard compacted sand.

The treacherous soil of the clay belt was the cause of a great deal of trouble in securing stable foundations, especially when attempting to excavate in mid-stream. A coffer-dam for the main pier of the Abitibi bridge, consisting of 4 ft. of puddle, between an outer row of 12-in. ordinary sheet piling, and an inner row of Wakefield sheet piling, 18 in. wide, failed to prove watertight. Eventually a continuous lining of steel sheet piles was driven around the inside and left in the work. The cofferdam was then partly unwatered, and material squeezed up by the foundation piles excavated with an orange-peel bucket to slightly below the river bed. Concrete for this pier was laid in mid-winter, much of it under

water, being prevented from freezing by the injection of steam. Fig. 4 and 5 show work at this pier. A cofferdam of sand bags at the Mattagami was used, with indifferent success.

When possible, long spans were used to avoid foundations in midstream where clay was encountered in the river bed. For shore foundation pits, round logs were generally used to prevent caving in, as sawn lumber was expensive or unprocurable where such pits were dug ahead of the steel. Trestles of unsquared timber were erected at most of the openings where a bridge or culvert was required. They were constructed of the largest timber in the vicinity, irrespective of variety, even cottonwood being used. For the longer stringers, however, British Columbia fir was imported. These trestles were of the most temporary character, and in a few cases failed to withstand the impact of outgoing ice during the spring freshets. They served, however, to push the track ahead, so that steel and cement could be brought in for the permanent structures.

Concrete was almost universally employed for substructures. This was partly owing to the absence of a good quarrying stone, but more largely to the scarcity of skilled stone cutters and masons.

There will be about 240 steel bridges and viaducts, or a total length of 11 miles, and aggregating 61,000 tons. Of this amount, 52,000 tons have been erected or are under construction, leaving about 9,000 tons to be let. The greater part of this will be erected in 1912 and the balance in 1913. The maximum single span is 300 ft., and the Winnipeg River bridge, is an example of these 300 ft. truss spans. Steel viaducts are built with 40 ft. towers and 60 ft. intermediate spans. The viaduct over the Mistongo River (Abitibi region), is typical of these structures. All bridges are designed according to Dominion government specifications; engine loading, class "heavy," weight 180 tons, 49,400 lb. on each pair of drivers. Plate girder spans, both through and deck, are used up to a length of 100 ft. Bridge lettings are generally given early in the year and cover the required erection for the same year, depending on the concrete being completed and track reaching the bridge site. Upon these conditions the time of completion depends. For transportation, construction rates are given bridge companies over lines under construction, on a ton-mile basis. Bridge companies are furnished with drawings and weights of steel, so all can bid under the same conditions. All steel contracts are for a pound price erected, and a unit price for timber in floor.

TRACK AND TRACKLAYING.

The track is laid with 80 lb. rails of Am. Soc. C.E. section, 33 ft. long, with four bolt angle-bar joints. There are 3,000 ties per mile, 18 ties per rail on

in the summer, but when this melted, a lot of repairing and shimming was required to render the line safe for material and surfacing trains.

Throughout Jan., 1912, tracklaying was continued west of the Nagagami River at the rate of one-third mile per day, with the thermometer often 40° below zero, and seldom above 5° below. Under favorable conditions, two miles of track a day was often laid for short periods, but temporary interruptions usually brought the average down below one mile a day.

TELEGRAPH.

The telegraph line is being built at the same time as the railway. It provides for an ultimate capacity of 12 wires, although only two wires are now being erected.

PROGRESS AND DELAYS.

It was hoped the entire railway would be completed in six years. Progress, however, on that portion to which access could be had only from either end, was continually interrupted by delay in getting out some large cut, failure of a temporary structure, development of sink holes, or other unforeseen cause. Throughout part of northern Ontario and Quebec, no supplies could be moved except in winter, by reason of the extensive prevalence of clay and muskegs, over which horses could not travel. In other localities, such as those served by Lakes Nipigon, Sturgeon and, to a less extent, Abitibi, contractors were dependent for transport on the season of open navigation. Frequently it was essential to have supplies conveyed part way by steamer and part by winter road.

Failure to foresee and make provision for what should be required months, or even a year ahead, meant serious loss. Uncertainty regarding the duration of the seasons had to be allowed for also. In 1907 there was a 2 ft. depth of snow in the Kenogami district on June 1, and the ice in Lake Nipigon did not break up until June 16; whereas on another occasion snow had disappeared from long stretches of the route (running east from Cochrane and Matheson) before the end of March. Navigation could not generally be relied on after about Oct. 20 on many of the waterways traversed. Toward the close of one of the busiest seasons on Lake Nipigon, both steamboats operating on this route went aground within a fortnight of each other, in consequence of which large quantities of essential supplies were not delivered until late in the winter. During the excessively dry summers of 1909 and 1910, disastrous forest fires swept over the country. These did enormous damage along the line north of the height of land, burning up contractors' camps, warehouses and plant, and putting a stop to the work in many localities.

Scarcity of labor, and time lost in replacing men who quit, was an ever pres-

ward from Moncton, except for a short distance in southern Quebec, and the yet unbridged St. Lawrence.

Another stretch of track extends east and west of Cochrane, covering 330 miles of the clay belt. This leaves a gap of 150 miles in northern Quebec and another of 240 miles in northern Ontario. Across the former, contractors were putting in supplies last winter, but except for the most easterly 10 miles, which is partly constructed, no grading has yet been done. Throughout the latter, however, only a small amount of excavation and some temporary trestles remain to be completed, on which work is being rushed, so as not to delay the "pioneers" of the tracklaying gangs working from either end. These are expected to meet not later than the end of the present year, giving through connection by way of the T. & N. O. Ry. between the cities of eastern Canada and the wheat fields of the West.

Across New Brunswick, east and west of Quebec city, for about 100 miles out of Cochrane, and between Winnipeg and Superior Junction, train filling, surfacing and ballasting are finished steel bridges are in place; water tanks, stations and section houses built, or under construction; telegraph line strung, and the line practically ready for operation. Division yards are located at an average of 120 miles apart, and the grading and the work on engine houses and other necessary structures for these are well advanced, at all except three of the yards. Sidings are provided about seven miles apart, with a water tank at every third siding.

While the whole country west of the settled part of Quebec was a wilderness six years ago, thriving towns have since grown up at La Tuque, Cochrane, Hearst and Graham. All of these are actual or prospective junction points with other railways and all in the midst of vast pulp-producing forests. La Tuque has the enormous undeveloped water powers of the St. Maurice River behind it, and Cochrane and Hearst are destined to be the market towns for the future farms of the clay belt.

PROGRESS REPORTS ON CONSTRUCTION.

In order to keep check on the rate of progress of the work D. MacPherson, the Assistant to the Chairman introduced percentage forms of reports, being modifications and extensions of somewhat similar forms in use on the C.P.R. The form shown in fig. 3 is returned monthly to the Assistant to the Chairman by the division engineers, through the district engineers, and it is then graphically plotted on a diagram, a portion of which is shown in fig. 4. This shows not only the percentage done during the month on grading, ballasting, and all other items of construction, but also shows the percentage done to date under each of these headings and the

tangents and 20 on curves. By far the greater part of the ties cut for the line are of jack-pine; tamarack, hemlock, cedar and spruce are used in lesser quantities. Both single and double boom "pioneer cars" were used in tracklaying work. Tracklaying was sometimes carried on throughout the winter, the snow being in some cases shovelled or ploughed off the grade, or simply tramped down sufficiently not to impede the "tie-buckers." Finally snow packed about the ties was found to make a much firmer and more even skeleton track than that laid

ent cause of delay. By far the greater part of the grading was sublet to "station men," who frequently "jumped" if they found themselves going behind with their work. Prices, however, were high, and in most cases, covered the extra cost of pushing the work in the face of unfavorable conditions.

The undertaking has now progressed to such a point that it is reasonably certain trains will be running across the whole eastern division sometime in 1914. The track is already laid 355 miles eastward from Winnipeg and 750 miles west-

percentage done of the whole work in each main contract. This form of report has been found invaluable as an aid in answering requests for information from the government and for compiling the annual reports.

The form of progress report on construction is a sheet 14 in. wide and 17 in. high, divided into seven vertical columns, with headings as follows: 1, class of work; 2, percentage done in month; 3, percentage done to date; 4, cost of work done during month; 5, cost of work done to date; 6, approximate estimate of total

cost of work; 7, brief description of work done. The itemized classes of work in the first column are as follows: 1, grading; 2, tracklaying; 3, ballasting; 4, trestles, culverts and small waterways; 5, permanent bridge substructures; 6, tunnels; 7, fencing; 8, water service; 9, telegraph line; 10, sundry; 11, important individual pieces of work included in the above items, but for which detail percentages are desirable; 12, engine houses, 13, buildings, (stations, section houses, tool houses, trainmen's houses, freight sheds, store houses, ice houses, coaling plants, cinder hoists); 14, advances and deductions; 15, extra work orders.

The percentages are of the total am-

water. The distance from Winnipeg to Quebec via C.P.R. to Fort William, and lake, canal and St. Lawrence River to Quebec is 1,771 miles, involving five transshipments of wheat. The distance on the National Transcontinental Ry. will be 1,351 miles, and, as the maximum east-bound grade is 0.04%, compensated for curvature, a Mallet articulated compound is capable of hauling, on this grade, a gross load behind the tender of 4,290 tons. Assuming the tare 33½% of gross load, the net paying load would be 2,860 tons, equal to 95,333 bush. of wheat, in one train. Assuming the earnings of such trains to be \$4.40 a train mile, or exactly double the earnings of the C.P.R.

Cape Breton Coal, Iron and Railway Company, Ltd.

This company offered recently for subscription in London, Eng., £300,000 sterling 6% first mortgage gold bonds at £98 per £100 bond with a bonus of one share of \$100 for each bond. The prospectus shows that the authorized bond issue is as follows:— 6% 1st mortgage gold bonds, £410,900; 5% income bonds (of which \$921,000 are issued) \$2,000,000. The capital is \$5,000,000, of which 40,000 shares of \$100 each are issued, or agreed to be issued, as fully paid.

The company was incorporated in

Fig. 4. Portion of Progress Diagram, National Transcontinental Railway.

(The cut shows only the first three and the last of the several classes of work on the entire diagram.)

ount of work done on the division (including individual works shown in detail, if any), and they represent the percentage of money value of work done. For tracklaying, ballasting, fencing and telegraph line, the percentage columns must be filled in on this basis, and also the total number of miles completed must be given in the last column (brief description).

The engineering organization consists of a Chief Engineer, G. Grant; assistant Chief Engineer; Bridge Engineer, R. F. Uniacke; district engineers (each in charge of a district 250 to 400 miles long) division engineers (in charge of 40 to 50 miles), resident engineers (in charge of 10 to 15 miles). The Chairman of the National Transcontinental Railway Commission is R. W. Leonard.

FREIGHT TRANSPORTATION FACILITIES AND ADVANTAGES.

The originally estimated distance of 1,900 miles between Moncton and Winnipeg has been reduced gradually by repeated revisions of location at various points to a distance of 1,804.8 miles. This distance is 261 miles less than the shortest distance over any other combined railways between Moncton and Winnipeg. The distance between Winnipeg and Quebec will be 1,351 miles, which is 223 miles shorter than the C.P.R., and the grades are so much more favorable that engines of equal capacity should haul nearly twice the load on the new line than they can on the latter.

Mr. MacPherson points out that transportation of grain by water has always been much cheaper than by rail, but the latter has been slowly and surely cheapening until the present time, when the easy gradients and tremendously powerful locomotives of modern lines will make a combination on land difficult to excel (or peradventure to equal) on

freight train miles for 1908, the cost per bushel over the 1,351 miles between Winnipeg and Quebec is bound to be 4.25c. The lowest rate that has been in force from Fort William to Montreal, via the lake, canal and St. Lawrence River, a distance of 1,216 miles, is believed to have been 4c. per bush. in 1908. This rate for 1,216 miles would be equivalent to 4.44c. for 1,351 miles, so that, at \$4.40 per train mile, the engines above referred to could haul grain on the National Transcontinental Ry. eastbound from Winnipeg to Quebec for 0.19c. per bush. cheaper than the cheapest existing water route could haul it the same distance, and 10.86c. per bush cheaper than the present combined rail and water rates between the two points in question; in brief, at about 25% of the present rail and water rate. It would appear, therefore, that the days of the absolute supremacy of water transportation are in danger of at least a partial eclipse.

The foregoing, reproduced from Engineering News, was compiled mainly from information furnished by D. MacPherson, M. Can. Soc. C.E., Assistant to the Chairman N.T.R. Commission, which included a detailed statement, prepared at Mr. MacPherson's instance, by Karl Weatherbee, one of the assistant district engineers.

The National Association of Railway Agents, which will assemble at Chicago, Ill., Sept. 7, to undertake a three weeks' trip to the Pacific coast, will proceed over the Minneapolis, St. Paul and Sault Ste. Marie Ry., to Duluth, Minn., and thence to Winnipeg, from which point they will go to Vancouver over the C.P.R., returning by boat to Seattle, Wash., and thence to Chicago, where they will disperse.

Nova Scotia in 1895, to acquire and work coal areas in Cape Breton, and has acquired about 50,000 acres in the vicinity of Mira, Cow, and Glace Bays. Development work was started in 1904, and it is stated that the colliery has been developed and equipped to produce 500 tons a day, which output can be handled as soon as a railway to Mira Bay and shipping facilities there are complete. The company in 1905 built a short piece of railway from the colliery at Broughton to the Sydney and Louisburg Ry. and the President, H. Mayhew, states that the extension, with wharves, and other facilities for handling the coal at Mira Bay can be completed within six months and will not cost over \$400,000, which includes about \$120,000 for rolling stock.

Four of the directors, H. Mayhew, W. B. Gladstone, A. H. Ramsden-Tagore and C. T. Richardson, reside in England, the other director is Wm. Hanson, of Montreal.

The Reduction of Smoke by the use of underfeed mechanical stokers has been effectively accomplished on freight locomotives on the Vandania Railroad, in recent months, according to W. C. Arp, Superintendent of Motive Power of that line. They are said to dissipate smoke promptly while the locomotive is working, and when combined with instructions to the crew are found to produce good results. This company finds that a knowledge of the various coals used and consideration of the conditions under which they are burned are aids in the reduction of smoke.

George Stephen, General Freight Agent, Canadian Northern Ry., Winnipeg, Man., writes: "I find Canadian Railway and Marine World very interesting and instructive and wish it continued success."

Canadian Pacific Railway Passenger Terminal and Office Facilities at Vancouver.

The last issue of Canadian Railway and Marine World contained a description of the improvements which have been started on the C.P.R. passenger terminal at Vancouver, B.C. The late date at which the official information reached this office rendered it impossible to have an engraving made in time for that issue so that the description alone could be published. The plan is given on this page and so that it may be thoroughly understood a portion of the description is repeated below:—

The present passenger station, which is located at the foot of Granville St., near the shore line of Burrard Inlet, was

built about 14 years ago, and except for minor alterations, is unchanged from its original plan. The general waiting room, and ticket offices are at the street level, and the baggage room is on the track level, which is about 30 feet below the street.

Along the water front across the local freight yard tracks are located the steamship wharves. There are two large sheds on a jetty pier of recent construction used by the C.P.R. trans-Pacific steamship lines; also five sheds adjoining the longitudinal wharves used by the C.P.R. Victoria, Seattle, Alaska and other steamship lines. Between the

wharf sheds and the passenger tracks adjoining the passenger station certain of the freight tracks serve the several sheds, and other tracks are used for drilling and storage. The yard tracks extend along the harbor front about a mile and a half.

The growth of Vancouver has rendered inadequate the present facilities for handling the C.P.R.'s terminal business and the general plan adopted has been designed to relieve the present congestion, as well as to provide for reasonable growth in the near future.

The general scheme embraces a passenger station and office building located

ed on available land immediately east of the present passenger station. There will be four passenger tracks, with provision for more when required, separated by wide platforms, between the station and the present freight yard. The passenger tracks are to be raised about 5 ft. above the present track level to reduce the difference in level between the street and the tracks to about 25 ft.

In order to avoid an inconvenient grade crossing and delays to traffic between the city and steamship wharf a bridge on the line of Granville St. extended, is to pass over the passenger and freight tracks to the steamship pier and

connect directly with passenger accommodations on the pier. An incline is also to be built leading from the west side of this bridge to the wharf, giving access to the lower deck of the pier and freight sheds and the water front. Another viaduct over the tracks is to be built on the line of Burrard St. extended northerly, with an incline giving access to the present trans Pacific pier and other portions of the water front.

The main entrance of the passenger station will be on Cordova St. with the main waiting room located centrally in the station on the street level. Ticket offices serving the several classes of railway and steamship passengers will be located at one end of the waiting room, and the baggage checking room, luncheon and dining room, parcel room, women's waiting room, men's smoking room, news booth, information booth and other facilities will be all placed immediately adjoining the main waiting room.

On the lower floors of the station will be the baggage rooms, express company's space, immigrants' rooms, supply rooms, and other station facilities not directly used by passengers. Stairways and lifts will connect the two levels of the station and also afford communication with the office floor above. A separate foot bridge will be carried over the passenger tracks directly connected with the waiting room at one end and with stairways leading to the track level giving access to platforms without crossing tracks at grade. The track platforms will be 1,000 ft. long, and will be covered with shelter sheds of the umbrella type. The platform adjoining the station will be used only for baggage express and supplies.

Above the public rooms of the station building the space will be devoted to the company's offices. The interior arrangement of the office space will be adapted for a unit system of sub-division; that is, each panel will have heating and lighting facilities so that partitions may be placed or removed at will in order to provide for changes in arrangement of office accommodations which may be desired from time to time.

The proposed steamship station on the pier will be a two level building, the upper floor being devoted to the passenger business and offices and the lower floor to freight, baggage and express. There will be double level gangways on the west side of the pier, which will be used for the Victoria and Seattle service, the lower gangway being used for freight and the upper for passengers; these gangways to be supported on floating pontoons to maintain the landing at a constant level with respect to the boats. On the passenger or upper level of the pier will be waiting rooms, ticket offices, baggage checking room, customs office and other conveniences. Separate

at Vancouver are unusual as compared with other large terminals on account of the absence of suburban business. The aggregate number of trains is not large, but they are long and frequently are run in several sections and contain a number of classes of traffic.

The designs for the terminal have been prepared by Westinghouse, Church, Kerr and Co., in co-operation with C.P.R. officials, and the construction of the station and facilities is being carried out by the same organization.

Improved Design of Numbers for Headlights, Etc., on the C.P.R.

Owing to the rapidity with which numbers on locomotive headlights, locomotives, cars, etc., have to be read, and with all kinds of varying lights, it is of the utmost importance, and essential to safety, that they should be as plain as possible, and that all similarities should be got rid of. It is a well known fact

Section of Working Time Table, C.P.R. Western Lines.

that the usual figures 3, 6 and 8 are not very distinctive and that they may be easily mistaken for one another.

With a view to remedying this, George Bury, Vice President and General Manager, Western Lines, C.P.R., has designed a series of letters which are certainly a great improvement on the ordinary ones and which it would be very difficult to mistake, as they appear to remove all possibility of error, the long loops in the 3's and 6's having been got rid of, while the difference between 5 and 6 has been made more marked.

The accompanying drawing shows the letters Mr. Bury has designed, which are being used on locomotive headlights and in working time tables on the Western Lines. A facsimile is also given of a section of a working time table, so that the figures may be compared with the ordinary ones.

It is probable that the new figures will also be used for locomotive cabs and tenders and for cars, and they may be adopted for the whole C.P.R. system.

Steel Bridges on the Grand Trunk Pacific Railway.

By J. C. Le Grand, Bridge Engineer, G.T.P.R.

Our bridges are designed in accordance with the specifications of the Department of Railways and Canals, to carry a live load to correspond to class "heavy" of the said specifications, viz., a moving load composed of two 180 ton compound engines followed by a train estimated at 4,750 lbs. per lineal foot of track.

The story of a bridge can be summarized as follows:—Study of the crossing at site by the field engineers, who prepare a cross-section plan, also contour map showing the shape of the ground, kind of foundation, high and low water, velocities of stream, etc. When this information reaches the bridge department one or more general diagrams are prepared and stress diagrams of the different parts of the structure are studied. From these stress diagrams estimated weights are made and the cost of the whole crossing is computed; then comes the designing of the different parts of the substructure and superstructure. Bids are then called for, and when contracts are let complete sets of designs, both of substructure and superstructure, are sent to the bridge company, and set of substructure drawings sent to the field—then everything is supposed to go smoothly.

I will take in order a few of the bridges, beginning at Fort William, on our Lake Superior branch, then along the main line to Winnipeg, and west of Winnipeg as far as they have been built, followed by those on our branch lines.

At Fort William we have a bridge over the Kaministiquia River, 394 ft. 3 in. between parapet walls, composed of one 253 ft. swing span and one 125 ft. through truss span. This bridge has been designed to carry a single railway track and one roadway on each side, supported on brackets, each roadway capable of carrying an electric track. The distance from base of rail to water line is 33 ft., to the bottom of river 56 ft., and to rock line 95 ft. The principal feature of this bridge is that the centre pier has been carried down to rock line through a steel cofferdam 38 ft. in diameter and 63 ft. deep. This, I understand, sets a record for foundation made through open cofferdam under water. The pier between the swing span and the fixed span is composed of two twin cylinders 15 ft. in diameter, resting on two steel cofferdams 18 ft. in diameter, filled with concrete, and 65 ft. deep.

The next steel bridge on the Lake Superior branch, at the crossing of the Dog River, is 254 ft. long, composed of two 125 ft. deck spans and temporary wooden trestle on each end. Base of rail to high water is 39 ft., to low water 45 ft., and to river bottom 51 ft.

We next cross the Winnipeg River at

Locomotive Headlight Numbers used on C.P.R. Western Lines.

rooms will be provided for outgoing and incoming passengers. Two tracks will be placed on the surface of the pier within the shed, and one track on the outside of the building for the direct handling of freight between cars and steamers.

The essence of the general design has been to secure easy lines of communication between the railway trains, steamers and the city. The traffic conditions

The Huntsville, Lake of Bays and Lake Simcoe Navigation Co. is having an engine for one of its vessels compounded at the Polson Iron Works, Toronto.

The Dominion Government s.s. La Canadienne, which broke through the lock gates of the Welland canal at Port Colborne, June 20, was docked at Port Dalhousie for the repairing of two holes which were punched in her hull.

Minaki with a bridge about 410 ft. long, composed of one 300 ft. through span and one 100 ft. deck girder span. Base of rail to high water is 29 ft., to low water 33 ft., to river bottom 79 ft., which means about 50 ft. of water at high water.

Next we have a bridge over the Assiniboine River at Winnipeg, 463 ft. 3 in. between parapet walls, composed of one

44 ft. through girder span, four 80 ft. deck spans, and one 90 ft. lift span trunnion type. This bridge is designed for a double track. Base of rail to high water 15 ft., to low water 43 ft., to bottom of river 56 ft., and to rock 63 ft.

Our first steel bridge west of Winnipeg, on the main line, at mile 45, over the Assiniboine River, is 437 ft. 2 in. inside of parapet walls, composed of one 250 ft. through truss span and one 88 ft. through plate girder span at each end. Base of rail to high water 13 ft., to low water 22 ft., and to river bottom 34 ft.

We also cross the Assiniboine River at mile 203. This crossing is 255 ft. in-

On the same mile we cross the McLeod River with a bridge of 1,066 ft. 11 in. between parapet walls, composed of two 70 ft. end deck spans, four 210 ft. deck truss spans, two 40 ft. tower spans resting on two steel towers, one river span 80 ft. high and abutments. Base of rail to high water 107 ft., to low water 118 ft., to bottom of river about 122 ft.

At mile 980 we cross the valley of Prairie Creek with a bridge 802 ft. 2 in. between parapet walls, composed of two 70 ft. end deck spans, three 70 ft. and nine 50 ft. intermediate deck spans resting on six towers, one bent and two abutments. Base of rail to high water

river at miles 24.5 and 35.5 with similar spans. At mile 34 we again cross this river with a 66-ft. through plate girder span. Base of rail to high water 8 ft., to low water 13 ft., to bottom of river 15 ft.

On our main line from Prince Rupert east we have one bridge crossing the Zanardi Rapids at mile 8, 658 ft. 4 in. between parapet walls, composed of three 55-ft. through plate girder spans, two 125-ft. and one 225-ft. through truss spans. Base of rail to high water which is the highest tide, 7 ft. 6 in.; to low water 32 ft. 6 in., to bottom of river 43 ft. 6 in.

Outside of the above bridges, which are now complete, we have under construction or study about 40 more, one of the most important, now actually under construction, being at mile 164, Prince Rupert east, over the Skeena River.

The foregoing paper was read before the Western Canada Railway Club recently.

The Canadian Northern Railway Bridge Over the Pembina River, Alta.

The route selected for the extension of the C.N.R. westward from Edmonton, Alta., towards the Yellowhead Pass, involves the construction of a couple of rather heavy bridges over the Pembina and McLeod Rivers, as these streams have eroded their channels far below the general level of the country. At the Pembina River the banks rise steeply from the water's edge without the usual river flats intervening between the channel and the terraced benches so often seen in deep river valleys; the absence of river flats at the Pembina River thus reducing the length necessary to be bridged.

The total length of steel work is 780 ft. 8 ins., the approach at the east end being 28 bents of the C.N.R. standard framed timber trestle 68 ft. in height. The river span is 216 ft. long, supported on steel towers on concrete pedestals, the span of these towers being 60 ft. The east and west flanking spans are respectively 162 and 135 ft. long, and the western approach is of viaduct construction.

The three truss spans are of the Pratt type, with rivetted connections, the panel spacing being uniformly 27 ft., the trusses are spaced 17½ ft. c. to c., and the depth of trusses is 36 ft. from centre to centre of chords. The floor beams rest on the top of the upper chord with bracket connections to chord at ends of floor beams.

Canadian Northern Railway Bridge over Pembina River.

Base of rail to high water 96 ft., to low water 111 ft., to bottom of river 117 ft.

On the Alberta coal branch, which starts from Bickerdike, mile 932 west of Winnipeg, we cross the McLeod River at mile 6 with a bridge of 304 ft. of steel, with timber approach at each end. The steel part is composed of two 150-ft. deck truss spans, resting on masonry. Base of rail to high water 49 ft., to low water 62 ft., to river bottom 65 ft.

On the same branch we cross the Embarras River at mile 22 with an 80-ft. deck girder. Base of rail to high water 22 ft., to low water 28 ft., to bottom of river 30 ft. We also cross the same

side of parapet walls, and is composed of one 250 ft. through truss span. Base of rail to high water 8 ft., to low water 20 ft., to river bottom 30 ft.

At mile 468 we cross the South Saskatchewan River near Saskatoon with a bridge of 1,501 ft. inside of parapet walls, composed of one 175 ft. through truss span, five 225 ft. deck truss spans, one 125 ft. deck truss span, and one 50 ft. deck span. Base of rail to high water 52 ft., to low water 71 ft., to river bottom 75 ft.

At mile 675 we cross the big Battle River valley with a steel viaduct of 2,772 ft., and wooden trestle of 2,600 ft. The steel structure is composed of fifty-one 50 ft. deck spans, one 70 ft. deck span, and one 150 ft. deck truss span, resting on 26 steel towers and two abutments. Base of rail to high water 157 ft., to low water 184 ft., to bottom of river 190 ft.

At mile 786 we cross the North Saskatchewan River at Clover Bar, about nine miles east of Edmonton, on a bridge 1,655 ft. 5 in. inside of parapet walls, composed of two 50 ft. end deck spans, eight 50 ft. and four 40 ft. intermediate spans resting on seven piers, three 225 ft. deck truss spans resting on piers, and two 150 ft. deck spans resting on piers and tower. Base of rail to high water 106 ft., to low water 137 ft., to bottom of river 143 ft. The principal feature of this crossing is the four concrete river piers, which have an average height from the bottom of foundation to the top, of 120 ft.

At mile 861 we cross the Pembina River on a bridge of 902 ft. 2 in. between parapet walls, composed of two 60 ft. end deck spans, two 210 ft. and one 240 ft. deck truss spans, and two 60 ft. tower spans, all resting on two towers and masonry. Base of rail to high water 137 ft., to low water 208 ft., to bottom of river 224 ft.

At mile 914 we cross the Wolf Creek with a bridge 652 ft. 2 in. between parapet walls, composed of two 60 ft. end deck spans, two 40 ft. tower spans, and three 150 ft. deck truss spans, resting on two steel towers and masonry. Base of rail to high water 116 ft., to low water 125 ft., to bottom of river 130 ft.

The Rebuilding of the C.P.R. Bridge Over the St. Lawrence River at Lachine.

An illustrated article on the rebuilding of the C.P.R. bridge over the St. Lawrence, at Lachine, Que., prepared by a member of Canadian Railway and Marine World's staff, who visited the work, was published in the February issue. The following information has been supplied officially recently:—

It was early in 1910 that the management came to the conclusion that the time had arrived to rebuild the bridge, so as to provide for a second track to handle the enormous increase in traffic over this important approach to Montreal from New York and other U.S. points, and contracts were let.

On July 12, 1910, the first operation was made on the enlargement of the old piers to carry the new girders before any of the new steel could be swung. This in itself was a huge job, and the contractors undertook to complete the first 11 piers during the first season. This was not accomplished, but the 11 piers were completed to a point above the water and all the work on them was completed by Nov. 8, 1911, leaving only pier 13 on the up-stream side to be finished when the cantilever is taken out, but this will not be started probably until next year, as until the last two stages are completed, which is part of the work now under way, this cannot be done, owing to the cantilever tracks of the bridge being in use.

The work on the superstructure was commenced March 15, 1911, when the placing of the two 80 ft. deck plates was undertaken, and ever since the work has been hurried forward with all speed. The bridge, when completed, will contain steel spans as follows: Six 80 ft. long, sixteen 120 ft., four 270 ft., two 122 ft., eight 240 ft., four 270, and four 480 ft., making the total length of the bridge in spans, 3,138 ft. The bridge was cut down, so to speak, from four 240's to eight 120's as far as pier seven. The piers on which the girders are resting consist of open casement to pier seven, counting from the island side, and from eight to 15 inclusive, the pneumatic casing was used. Eleven spans were erected from the main line, on the down stream track, out to pier seven, and then a cross over enabled the traffic to reach the new steel and the work of bridging was continued without the traffic being in the slightest degree interrupted, beyond that caution was used by trains in crossing the bridge, every train travelling at slow speed.

The changing or reducing of the spans to smaller ones, and the device used for putting them into place, resulted in the saving of thousands of dollars. The introduction of the smaller spans has no tendency to reduce the strength of the bridge, but on the other hand, it greatly increases it, as the weight is being carried by more spans on shorter lengths. During the carrying out of the work, only two cross-overs were necessary to complete it to the eleventh pier, from which point the huge channel spans, which are 480 ft. long, commence. The placing of the spans has reached such a point that no further cross-overs will be required, and the traffic will cross on the steel on the west side of the bridge until the east is totally completed, which it is expected will be by next autumn, provided everything goes on satisfactorily. The whole of the bridge as far as the eleventh pier, or the swinging of the huge channel spans are concerned, is finished, with the exception of a small length of new steel to replace the old, and the progress has been well maintained throughout with a gang of nearly 100 men.

Work has now commenced in connection with the placing of the two 408 ft. spans, which will fully complete the west side of the bridge. The spans are being erected at the Dominion Bridge Co.'s

yards, which are in close proximity to the bridge connected by a spur line. As soon as this is finished, the spans will be re-erected on the finished deck-plate portion of the bridge on the Caughnawaga side of the river, where space sufficient in length has been left for the purpose. This done, one end will be attached to a huge derrick which has been specially erected for the purpose of steadying and assisting in putting the end into place, while the other end will be floated on a huge scow in the river below, and in this way the spans will be floated into position. It is expected that the work which has to be done before the bridge is finally completed for second track service, will occupy at least another twelve months. The work of floating in the four huge spans will occupy almost as much time as the rest of the bridge work has done. These through channel spans are not of the cantilever type, but the strength of the bridge will be below, and when the work is nished, the bridge will constitute one of the finest pieces of engineering work on this

Derrick erected to assist the Floating in of the 408 ft. spans, C.P.R. Lachine Bridge.

continent. The two flanking spans on the south side are practically completed, so that everything is in readiness for going ahead with the work, and this will be done within the next week or two, as soon as the steel is discharged from the workshop.

It is expected that early in August the second tracking will be completed on both the down stream side and the up stream side to the point where the longest spans are to be put in to replace the present cantilever spans.

In the new bridge there will be 28,072,252 lbs. of steel. The 80 ft. lengths run 110,000 lbs., the 120's 226,000, the 240's 960,000 lbs., the 270's 1,324,138 lbs., and the 408's 2,600,000 lbs. Starting from the island side, the bridge widens out at the seventh pier, from 16 ft. from centre to centre of trusses, to 20 ft. at the eleventh pier, and continues from that point to the end.

The work being done in the vicinity of the Lachine bridge is of a very extensive character, and not only includes the en-

largement or second tracking of the structure across the St. Lawrence, but three other bridges approaching the main bridge, are to be second tracked, while the bridge across the Lachine canal will, in the near future, have to undergo the same enlargement. This is a heavy swing bridge, but the appropriation has not yet been made, and several matters are to be settled before the work can be started. Still, with the complete second tracking of the approach from the Montreal main line to the Lachine bridge, the second tracking of the canal bridge must inevitably follow. New spans have been inserted in the bridge that crosses the G.T.R. at Rockfield, and the filling up of the sidings for the double tracks approaching on either side is being continued. At the Highlands extensive works are also being carried out.

The C.P.R. is carrying out these works at a cost of about \$3,000,000, in pursuance of its policy to build a second track over the whole of its main transcontinental line, and it is anticipated that before many years, this will have been completed from St. John, N.B., to Vancouver, B.C. Owing to the great difficulty in securing the requisite number of men in various parts of the country, the company is somewhat handicapped in pushing forward the huge work of double tracking.

First Aid to the Injured on the Canadian Pacific Railway.

By S. A. Gidlow, General Secretary, St. John Ambulance Association, C.P.R.

On first thoughts, the reader may consider the subject either too dry, or something entirely out of his line, therefore, I will commence by stating that if he will have a little patience he will find it not so dry after all, and, no matter what his occupation, it does concern him very materially. One of the first questions usually asked is, "What is First Aid?" and I think the best way to answer this question is to state what its objects are:

To instil into the public mind a few simple, practicable lessons showing how best to render instant attention to persons suffering accident or sudden sickness, pending the arrival of skilled medical assistance.

To teach people what not to do, so that there may be no likelihood of the bystander causing aggravation to injury, or loss of life through improper first aid treatment.

In case of emergency, such as bleeding, accidental poisoning, choking or drowning, a life may not be sacrificed by want of a little intelligent first aid knowledge on the part of the bystander.

To attempt to explain in detail the various kind of accidents in which first aid has been rendered successfully, would be wearisome, therefore a comparative list has been compiled showing the advantage of first aid, and the consequences resulting from the want of such knowledge:

WANT OF FIRST AID KNOWLEDGE.	VALUE OF FIRST AID KNOWLEDGE.
1. A little child was sitting at the dinner table with the family. With its mouth full of food, it got into a fit of temper over something its brother was having served to him, the food became lodged in the windpipe, and, notwithstanding the slapping of its back, it went black in the face, throwing its arms wildly about; the father rushed out of the house to fetch a doctor, who lived but a short distance away, but on his arrival life was extinct.	1. A little child, whilst eating an apple, bit off a piece larger than he intended. By some means this piece slipped down his windpipe, and became lodged. The child became black in the face; the mother rushed to a neighbor who happened to know first aid. Upon her arrival, the child, being found unconscious, she immediately used first aid knowledge as instructed, with the result the doctor stated, the child was none the worse for its accident.

2. A girl playing around the table accidentally pulled the table cloth and upset a pot of hot tea over her chest. One of the company present frantically pulled the child's clothes off, undoubtedly with good intentions, but the result was the skin was torn off the chest, necessitating her detention for three months in the hospital, where her life was despaired of for some time. In after life, when she became a mother, she was unable to suckle her offspring, in consequence of those injuries preventing the proper development of the breast.

3. Two cyclists were riding along a greasy road, when one had a side slip, throwing him beneath the wheels of a heavy van, which passed over one of his thighs, completely smashing the bone; the broken ends of the bone severing the main artery. His friend sent a messenger to the nearest doctor, about 30 yards away, and stood by his friend, seeing his life's blood ebbing away. Upon the arrival of the medical man life was pronounced extinct.

4. A man with a weakness of the lungs, whilst stooping down broke a blood-vessel, the blood gushed out in great quantities. His colleagues picked him up and carried him to the nearest doctor, but he had not proceeded many yards when he died in their arms.

2. A little child was sitting in a baby chair in front of the fire, when the mother, going to the fire for some purpose, accidentally caught the handle of a saucepan of boiling water, and tipped it over both feet and legs of the child. A first aid who happened to be present, treated the injuries as instructed. After a few days in bed and a little convalescence, the doctor discharged the child none the worse for its misadventure.

3. Father and son were driving in an automobile, and while attempting to make a short turn the back part of the machine struck a telegraph post with great force, pitching both occupants into the roadway. The father sustained a compound fracture—that is, a fracture where the bone has been driven through the skin—in addition to this the main artery was severed. The son, who had a knowledge of first aid, applied the proper treatment, stopped the bleeding, and conveyed him to the hospital, where he was complimented upon saving his father's life.

4. A lady was knocked down by a passing vehicle. The wheel passed over her chest, breaking several ribs, and the broken ends penetrated the lungs. Blood gushed out of her mouth. A first aid, happening to be on the scene, treated her under first aid rules; sent for a doctor, who ordered her removal to hospital by ambulance, where she ultimately recovered.

Let us take another form of comparison to show the value of this knowledge. Some little time back, a man was knocked down by a street car, causing a simple fracture of the thigh bone, that is to say, the bone only was broken, and none of the parts adjacent thereto, such as the tissues or arteries were injured. The bystanders, with the idea of getting the poor fellow out of the way of passing traffic, lifted him to a perpendicular position, with the weight of his body on the broken leg, thereby causing the broken bone to become further displaced, and to pierce the femoral, or main artery of the thigh. As a result of this well meant but ignorant action on the part of the public, the man died from loss of blood before the services of a medical man could be obtained. Had the driver or conductor of the street car in question, been instructed in the principles of first aid, and made use of such knowledge, the poor fellow's life could easily have been saved, and the company they were serving thereby saved heavy claims for damages.

The case of possible deaths from drowning demands special attention. Such may occur from the upsetting of a boat, a careless step by the river side, on the dock or harbor quay. In many of these there may be willing hands to save, but few possess sufficient knowledge to quickly restore animation and consciousness. Ignorant and careless handling of the supposed victim by drowning has often unwittingly completed the work of suffocation by immersion, and one can

realize what this means in this country, where an average of 700 drowning accidents occur every year.

First aid is a branch of work entirely different from that of the surgeon. It is special, and differs from the special training which every student receives. The medical student is taught to use all the best and most approved methods, while the first aid student is taught to use whatever is nearest to hand in the most scientific way possible. He must make a bandage out of a necktie or a handkerchief. He must improvise a tourniquet from a belt or brace; for splints he must utilize a stick, a rifle, an umbrella or folded newspapers, and construct a stretcher out of a couple of broomhandles and coats.

The officials of the C.P.R. centre of the St. John Ambulance Association have for some time past realized the value of this movement to their employees and to themselves, as is seen from the fact that they are now organizing first aid classes amongst all classes of employees throughout the railway system, so that no matter where an accident may happen, there you will find an ambulance man able and

P289 S. A. Gidlow,
General Organizing Secretary, St. John Ambulance
Association, C.P.R.

willing to render instant attention to persons suffering from accident or sudden sickness. The cost of instruction and the books and first aid material necessary, are furnished by the management free of charge. A lecturer is provided, who gives one lecture a week to the men until the full course of five lectures has been given. The syllabus of instruction is as follows:

FIRST LECTURE.—Preliminary remarks, objects of instruction, etc. A brief description of the human skeleton, bones, joints, and the muscular system. Signs, symptoms and treatment of fractures, dislocations, sprains and strains. The triangular bandage and its application.

SECOND LECTURE.—The heart and blood vessels. The circulation of the blood. The general direction of the main arteries, indicating the points where the circulation may be arrested by digital pressure or by the application of the tourniquet or by other means. The difference between arterial, venous and capillary bleeding, and the various extemporary means of arresting it. The triangular bandage and its application.

THIRD LECTURE.—A brief description of

the nervous system. First aid to persons suffering from shock or collapse after injury, injury to the brain, collapse from drink, epilepsy, fainting, hysteria, sunstroke, electric shock, effects of lightning, and convulsions in children. First aid in cases of frost-bite, burns, or scalds, injury by vitriol throwing, wounds, bites of animals, stings of insects. What to do when the dress catches fire. The triangular bandage and its application.

FOURTH LECTURE.—A brief description of the organs and mechanism of respiration. The immediate treatment of the apparently drowned, or otherwise suffocated, artificial respiration; treatment for choking. First aid to those poisoned. The immediate first aid treatment of injuries to the internal organs, and of those suffering from internal hemorrhage. Foreign bodies in the eye, ear and nose.

FIFTH LECTURE, (FOR MALES ONLY).—Improvised method of lifting and carrying the sick or injured. Methods of lifting and carrying the sick or injured on stretchers. The conveyance of such by rail or in vehicles.

FIFTH LECTURE, (FOR FEMALES ONLY).—Preparation for reception of accident cases. Means of lifting and carrying. Preparations of bed. Removing the clothes. Preparations for surgeon.

As soon as ever the lectures are finished, the men are taken in hand by one of the company's ambulance instructors, whose duty it is to teach the practical work, such as the proper application of bandages and splints, to various parts of body and lifting and carrying the injured on stretchers, etc. The reader may not think the placing of a man on a stretcher of much importance, but it is really a very important part of the work, as a great deal of damage may be done in placing a man on a stretcher.

No man is allowed to give instruction in the practical work before he is fully qualified, and before any such man is fully qualified to act as instructor, he must hold the certificate, voucher, and medallion of the St. John Ambulance Association, and these honors can only be obtained after three years constant application to first aid work, during which time he must attend three courses of lectures, and undergo three examinations in first aid, each examination more exacting than the previous one, before he obtains the medallion, or full qualifying badge of the Association. Before the instructor allows his class to go up for examination, the members of the class are expected to answer a series of test questions, and to do the practical work in connection with them. Below are given a few of each grades of questions, which the first aid student is expected to answer:

FIRST TEST.—What is first aid to the injured. What are signs? What are symptoms? What results of injuries must receive the first attention? What steps must be taken beyond the actual treatment of injury? How would you remove clothing when necessary? What must the first aid student not do? What is elementary anatomy? What is elementary physiology? Etc. etc. etc.

SECOND TEST.—What organs are concerned in the circulation of the blood? Trace the circulation of the blood through the organs and lungs. How many kinds of hemorrhage are there? In what way should arterial hemorrhage be controlled? What is a tourniquet? Describe the various main arteries? What is a fracture? State the general signs and symptoms that may be present in cases of fracture. What apparatus may be necessary for the treatment of fracture? How may splints and bandages be improvised? Give the general rules for the treatment of fractures, etc.

THIRD TEST.—State the general treatment for burns and scalds. What steps should be taken when a woman's dress takes fire? State the signs, symptoms and treatment for frost bite. State the

treatment for injuries to joints. How would you remove foreign bodies from the eye, ear and nose? State the treatment for wounds of the abdomen? What is the difference for treatment of injuries to the stomach, and of injuries to the liver, spleen, and intestines? Etc.

subject will be selected for him, and will thus have to study all. Notwithstanding, every candidate will have the same chance. There is a fixed minimum of total marks for all the subjects selected, together with a fixed minimum of total marks for each subject, so that by this

fort to bring its value home to the people. All who will help to do so will perform thereby, not only an act of charity, but will be forwarding a movement of great national importance.

I would insist that every railway official should take at least one course of lectures, for in scarcely any walk of life is there so great a need of intelligent assistance on the spot, as in the various ramifications of railway life. All are liable to accident, therefore, all must be depending to a more or less extent on these first aid principles.

No sane person desires, should he unfortunately suffer serious accident, to have the injury aggravated or his life sacrificed by the well meant but ignorant attention of bystanders, or for the want of a little intelligent first aid knowledge, the learning of which would only take a few hours of a person's lifetime.

CANADIAN PACIFIC RAILWAY COMPANY.

Office of Superintendent Angus Loco. Shops,
Montreal.....190..

SUBJECT

Ambulance man's report in connection with accident at the Angus Locomotive Shops.

Name of person injured

Description of injury

How accident was treated

Material used

Signature

Ambulance man.

Supt. Loco. Shops.

Note—The above is to be filled in by the Ambulance man who renders first aid and sent to the office of the Supt. of Angus Loco. Shops as soon as possible after the accident.

The C.P.R. classes in Montreal include some 500 men. Classes have also been organized at St. John, Carleton, Woodstock, Aroostook Jct., and McAdam Jct., N.B.; Brownville Jct., Me.; Ottawa and Toronto, Fort William and Kenora, Ont.; Winnipeg and Brandon, Man.; Moose Jaw, Sask.; Medicine Hat, Lethbridge and Calgary, Alta.; Cranbrook, Nelson, Eholt, Revelstoke and Vancouver, B.C., and many other points.

The C.P.R. centre of the St. John Ambulance Association has the following officers:—PATRONS:—Lord Strathcona and Mount Royal, Sir Thos. G. Shaughnessy.

C.P.R. men treating a fractured thigh.

FOURTH TEST.—What are the two symptoms of nerves? Of what is the cerebro-spinal system made up? What is the spinal cord? What are nerves like? Explain the sympathetic system. Explain the respiratory system. What is exciting respiration? What is inducing circulation? State the various forms of insensibility, and their treatment. What are the signs, symptoms and treatment for concussion of the brain? What are the signs, symptoms and treatment for compression of the brain, apoplexy and epilepsy? How would you treat for shock to the system? State the treatment for strangulation, hanging, smothering, or choking. What is the treatment for electric shock, and how would you liberate the subject from live wire? etc., etc., etc.

FIFTH TEST.—Under what heads may poisons be classified? What poisons give rise to convulsions, delirium, failure of respiration, and collapse? What are the signs, symptoms and treatment for poisoning by alcohol, opium, poisonous acids and alkalis? State the best methods for making a person vomit. What would you do with a person apparently drowned? etc.

As soon as the instructor considers the class ready for examination, he makes his report to the proper quarter, and a medical officer is then appointed to examine the class, and all who pass the examination satisfactorily are given the certificate of the St. John Ambulance Association, certifying that they are qualified to render first aid to the injured. After the examination the men are given one hour a month in order to meet together for practice, and are by this means kept up to a proper state of efficiency, also, at stated intervals, the men are inspected by a medical officer appointed by the management, so that the company's officials can see for themselves if their men are up to date, and able to do the work required of them.

The examinations are carried out with the greatest strictness practicable. Definite subjects are laid down, in which candidates are to be examined, and the same fixed number of subjects for each candidate, but arranged in such a manner that no candidate will know which

system every man has to pass a general aggregate of marks, and must also know each subject. Ignorance on an essential point disqualifies the candidate, whatever the total marks gained, or whatever the general knowledge may be. Supposing a candidate does not know how to stop an artery from bleeding, it would not matter how much else he knows, he would be disqualified. The examination

Lifting an injured workman.

is thus made fair, thorough, definite and uniform.

First aid is still a novel idea to the great mass of the working population in Canada; it forms to them, in fact, a new departure in the conduct of life, and, as in the case of all new departures, it requires much time, care, patience and ef-

Sir Wm. Whyte, R. B. Angus. PRESIDENT, D. McNicol. VICE PRESIDENTS, J. W. Leonard, George Bury, H. H. Vaughan; Grant Hall, W. R. Baker, G. P. Girdwood, M.D., A. D. MacTier, C. Murphy, H. A. Beatty, M.D., M.R.C.S., Eng. CHAIRMAN, L. R. Johnson. GENERAL SECRETARY, S. A. Gidlow.

Canadian Northern Railway Construction, Betterments, etc.

James Bay and Eastern Ry.—The Board of Railway Commissioners has approved of location plans for this line in Roberval tp., Que.

Grading on the line from outside Roberval was on July 19, reported to have been practically completed to Chute a l'Ours, about 30 miles, and track laying will be started Aug. 1. J. P. Mullarkey is the contractor. It is said that the line will be extended along the valley of the Ashuapmouchouan River, and through the Chibougamou country, to Nottaway Bay or James Bay.

Montreal Tunnel and Terminal Construction.—The company's plans for the tunnel from the north side of Lagachetiere St. to the new town on the western side of Mount Royal, were approved by the Board of Railway Commissioners, July 11. The question of the overhead viaduct from Lagachetiere St., to the harbor front was left over in order that the Montreal city council might have a further opportunity to study the plans submitted.

Preliminary work in sinking shafts at the city end of the tunnel was started July 13, and it was expected that boring operations would be started by July 30. It is estimated that 1,000,000 cubic yards of material will be excavated from the tunnel, and an additional 500,000 cubic yards from the excavations for the central station.

The Montreal city council gave consideration, July 21, to the company's plans to connect the tunnel up with the station in the east end at Moreau St. The route to some extent parallels the Lachine, Jacques Cartier and Maisonneuve Ry., and in approving it, the council reserved rights as to crossings of all present and future streets. This matter will be dealt with later on.

Montreal-Ottawa-Port Arthur Line.—Prior to leaving Montreal for England, June 26, Sir Wm. Mackenzie is reported to have said that the proceeds of the \$35,000,000 of bonds guaranteed by the Dominion Government for the building of the line was in the bank, and the contractors had 7,000 men at work pushing the different sections of the line to completion. The work would be completed by the end of 1914.

The first section of the line extends from Montreal to Hawkesbury, Ont., 58 miles, construction on which is well advanced and is expected to be completed this year. J. P. Mullarkey has the contract for this section of the line. The line from Hawkesbury to Ottawa has already been completed and is in operation. From a point outside Ottawa to Pembroke, 90 miles, grading is being pushed forward. J. P. Mullarkey being the contractor for this work also. It is expected to have track laid to Fitzroy harbor, 25 miles, this year.

G. A. Mountain, Chief Engineer of the Board of Railway Commissioners, has spent some time in North Bay, investigating the different routes recommended for the line through the town, and to plan a line which will meet the objections made to that surveyed by the company.

The Board of Railway Commissioners has approved of revised location surveys for the line through Badgerow, Field and Gibbons townships, northwest of North Bay. The Board has also approved of revised location plans for the line from mileage 208.3 to 211.47 west of Sudbury Jct.

Steel is reported to have been laid from Port Arthur, easterly to the mouth of the Mackenzie River, where a temporary bridge has been built and across which a temporary track has been laid. The Kennedy Construction Co. is reported to have the contract for the erection of the concrete piers and abutments for the permanent bridge. It is expected

that these will be completed in the spring.

Canadian Northern Ontario Ry.—The Board of Railway Commissioners has authorized the operation of traffic over the line from Toronto to Deseronto, Ont., rescinding previous orders. Work is well advanced on the line to Sydenham, which includes the cut offs on the Bay of Quinte Ry., the contract for which is being carried out by Angus Sinclair. From Sydenham to Ottawa, 90 miles, J. P. Mullarkey, is carrying out the contract for the greater part of the work, Ewen Mackenzie having completed the grading on the 20 miles from mileage 180 to 200. On this 90 miles track is reported to have been laid from Ottawa to the Rideau River, and track is also being laid westerly from Sydenham. Another track laying gang is preparing to start work at Forfar, where the line crosses the Brockville, Westport and Northern Ry.

A route map has been approved by the Minister of Railways for the company's projected line easterly from North Toronto for 7.2 miles.

Sir Wm. Mackenzie is reported as having recently stated that the company's plans included the laying out of large yards and shops at Leaside Jct., and smaller shops on the Rideau River, near Ottawa. The principal shops of the company would be those at Leaside Jct., near Toronto, and at Port Mann, B.C. A new building for the head offices would be erected in Toronto. The union station to be erected at North Toronto by the C.P.R. would be the company's principal station in the city, although a few of the trains might run into the Front St. station.

The Minister of Railways has approved of a route map for the company's proposed line through the counties of Lincoln and Welland, Ont.

Canadian Northern Ry.—The new train shed of the Port Garry union station at Winnipeg, was opened for traffic June 24. There are six tracks in the shed, which is being used by the C.N.R., the G.T. Pacific Ry., and the Great Northern and Northern Pacific Railways.

Considerable improvements are being made in the company's yards at St. Boniface, Man. It is reported that \$75,000 will be expended on the work before the end of the season.

The Board of Railway Commissioners has approved of location plans for a branch line through tps. 30-34, range 4, west of the second meridian, Sask., and through tps. 24-22, range 1, west of the 5th meridian, and range 29, west of the 4th meridian, Alta.

Work is reported to have been started on a 10-stall roundhouse with a machine shop attached at Radville, Sask. This is a divisional point on the company's line from Maryfield to Lethbridge, Alta.

M. H. MacLeod, General Manager, is reported as stating that the line into Calgary, Alta., will be completed by September. This line is to be continued southerly to Macleod, and the route plans for 12 miles southerly and westerly have been approved by the Minister of Railways. Construction on this line was started at the Macleod end, the Northern Construction Co. having the contract. Mr. MacLeod is also reported as stating that a contract will shortly be let for the remaining mileage into Calgary.

Canadian Northern Pacific Ry.—The supervision of the construction of the company's line from the Yellowhead Pass to the Pacific coast has been divided between the company's Winnipeg and Vancouver offices. T. H. White, who had charge of the final location surveys, and has been Chief Engineer for the C.N.P. Ry., has charge of the construction from the Pacific coast to the Albride summit, while the remaining mileage from Albride summit to the Yellowhead Pass is being supervised from the Winnipeg of-

fices. The construction headquarters of the Northern Construction Co., which has charge of the contract for the line from Kamloops to the Yellowhead Pass for itself and Foley, Welch and Stewart, advised us recently as follows:—McDonald Bros., who have a subcontract for the first 20 miles from Kamloops northeasterly, have practically completed the grading. The next 10 miles was sublet to Boyd and Craig, who have about two months' work yet to do to complete. The next 30 miles has been sublet to Murdoch and Co., who have made good progress during the three months they have been at work. There are about 500 men, including station gangs on this section. The sub-contract for the next 100 miles has been sublet to Twohy Bros. Co., who have two complete steam shovel plants on the ground and are busy taking in supplies, making two complete trips a week. Twohy Bros.' own steamboat goes up the Fraser River as far as mileage 100. The remaining mileage to the Albride summit, it was expected would be sublet at an early date.

Press reports state that contracts have been let for the ten bridges described on pg. 337 of our last issue as follows:—Substructures for seven of the bridges, Armstrong and Morrison, Vancouver, B.C.; substructure for one bridge, John Galt Engineering Co., Winnipeg; substructure for two bridges, C. F. Graff, Seattle, Wash., has the option of a refund at certain prices. The Dominion Bridge Co. has the contract for six of the superstructures, and the Canadian Bridge Co., Walkerville, Ont., the contract for the other four.

Surveys are being made for a branch line from Kamloops through Vernon to Kelowna, at which point a terminal site of 17 acres fronting on Okanagan Lake has been acquired. Press reports state that tenders will shortly be asked for the building of the line.

Press reports state that a contract has been let for the grading at the terminal yards at Port Mann. The contract, it is said, involves the raising of the level of the area by 4 ft., requiring the bringing in of 350,000 cubic yards of material. The yard will have room for 60 miles of track of which 30 miles will, it is said, be laid this year.

The line between Port Mann, and Hope has been completed, and a regular daily freight and passenger service will be put in operation Aug. 1. Press reports state that tenders will shortly be asked for the erection of the stations on this section of the line. Easterly from Hope the line is practically completed to near Rosedale; track has been laid to the Coquihalla River, and ballasting is in progress. The superstructure of the bridge across the Coquihalla River is being built, and it is expected that the grading will be completed as far as Yale, early in September. The boring of the tunnel at Yale is expected to be completed by Dec. 31, and beyond that point the work is well advanced to North Bend.

Sir Donald Mann, Vice President, is reported as having stated in Vancouver, July 6, that nothing would be decided about the company's terminals in that city until the city council had decided as to the disposal of the False Creek property. The location of terminals would determine the route and manner of the entrance of the line. The company would have an entrance independent of other lines.

Canadian North Eastern Ry.—The Minister of Railways for British Columbia, has approved of route map for the extension of the company's line from mileage 13.5 out of Stewart to the junction of the Naas and Blackwater rivers, 91.5 miles; of the route map of a branch line up the north fork of the Naas River, 50 miles; and of a branch starting from the Blackwater River for 95 miles, to the G.T. Pacific Ry. crossing of the Skeena River, 16 miles below Hazelton.

The Great Northern Railway's Policy in Canada.

Carl R. Gray, President, Great Northern Ry., writes Canadian Railway and Marine World, from St. Paul, Minn., under date of July 13 as follows:—

"My attention has just been called to an editorial in your July issue. Will you not do me the justice to print my unqualified denial of the correctness of any portion of the statement which you have quoted, and my additional assurance that I did not say to any one anything which would justify the alleged interview? The dispatch was sent out from Spokane, Wash., before I became officially connected with the Great Northern, and even before any official announcement had been made of my appointment. I had never been in Canada and I had not the slightest knowledge at the time of any of the plans of the Great Northern. Inasmuch as the only Canadian lines which we have in mind are intended to connect up with Vancouver as a port, and as none of them serve a country which could be called specially a grain growing section, the utter absurdity of the statement can be easily appreciated.

"This unauthorized and untrue interview has been very widely quoted, and I have recognized the utter futility of attempting to deny it in every quarter, but in view of the fact that you have accepted it as true and drawn from it certain conclusions (which I must admit on its face were justifiable, but which, in view of the facts, constitute an injustice both to the Great Northern Ry. and to myself), I am sure that it is only necessary to call your attention to the matter to secure equal publicity for my denial."

Had the interview referred to appeared in a daily paper as an ordinary press dispatch, we should not have paid any attention to it, but it was published in Engineering News, of New York, a technical paper with a reputation for accuracy, and we therefore accepted it as authentic. It credited Mr. Gray with stating as follows:—

"Millions of dollars are to be expended this year and next year in extending lines into the virgin territory of Washington and Oregon, and into the province of British Columbia. The plan is to drain the rich grain fields of Western Canada by means of north and south feeders. Contracted work in eastern Washington to the Pacific coast will be rushed to completion, and additional contracts will be awarded soon for extensive development in Northern Washington. Development of subsidiary lines in Oregon will be carried out by J. H. Young, the new President of the Spokane, Portland and Seattle Rd. and other Hill lines. The Northwest is our territory, and we are planning to strengthen our position in all parts of the western country."

We have pleasure in giving Mr. Gray's denial equal publicity. His statement that the only Canadian lines which his company has in contemplation are to connect up with Vancouver as a port is significant. But the fact must not be lost sight of that in addition to the arrangement under which the G.N.R. crosses the International Boundary and reaches Winnipeg over the Canadian Northern Ry. it has also crossed at two other points in Manitoba and has built lines to Portage la Prairie and Brandon, which certainly are draining "the rich grain fields of Western Canada by means of north and south lines."

A glance at the G.N.R.'s map will show that it has eleven other branch lines running northeasterly from its main line towards the International Boundary south of Manitoba and Saskatchewan, some of them being built almost to the boundary. Rightly or wrongly, the impression prevails that it has been the G.N.R.'s intention to extend some or all of these lines into Canada, and had the

reciprocity treaty been ratified, the probability is that some at least of such extensions would have been already made or under way.

Orders for Construction of Toronto Union Station and Viaduct.

The Board of Railway Commissioners passed order 17034, July 18, as follows.—Re consideration of plans of new union station, Toronto, filed by the railway companies: Upon the hearing of the matter at the sittings of the Board in Toronto, May 24, the Grand Trunk and Canadian Pacific Railway Companies and the city of Toronto being represented by counsel at the hearing, and what was alleged, it is ordered that the plan of the said proposed new union station, submitted by the G.T.R. Co., dated Jan. 17, 1912, and filed with the Board as plan A, be approved: the work of constructing the said station to be commenced forthwith and completed not later than Sept. 1, 1914; and that the railway companies be liable to a penalty of \$100 a day for every day they are in default under this order, with leave to move to extend the time, or to be relieved of such penalties, if any, if the facts warrant such application.

THE ORDER FOR THE VIADUCT.

The Board passed the following order 17033, July 18:—Re separation of grades in the city of Toronto, and order 7200, dated June 9, 1909, as amended by orders 13568 and 16019, dated April 25, 1911, and Feb. 22, 1912, respectively, it is ordered that the work ordered to be done under order 7200, as amended by orders 13568 and 16019, be commenced forthwith and completed on or before Sept. 1, 1914; and that the railway companies be liable to a penalty of \$100 a day for every day they shall be in default under this order, with leave to move to extend the time, or to be relieved of such penalties, if any, if the facts warrant such application.

Railway Lands Patented.—Letters patent were issued during May for railway lands in Manitoba, Saskatchewan, Alberta and British Columbia, as follows:—

	Acres.
Canadian Northern Alberta Ry.	15.87
Canadian Northern Ry.	9,897.94
Canadian Pacific Ry.	48.24
Grand Trunk Pacific Ry.	48,946
Qu'Appelle, Long Lake and Saskatchewan Rd. and Steamboat Co.	1,359.62
Total	11,370.616

The C.P.R. and the Canadian Northern Ry. each subscribed \$5,000 to the fund raised to aid those who suffered loss in the recent cyclone disaster at Regina, Sask.

The Brandon, Man., council unanimously passed a resolution, July 16, in favor of laying a double track on Tenth St., from Princess St. to Victoria St., and on July 18, the Mayor stated that he had vetoed the resolution.

The Nelson Electric Ry. Co., notified the city council, July 16, that it could not entertain the council's offer of \$75,000 for the line. The company suggested that a conference be held at which a price might be fixed.

J. A. Boswell, who has retired from the Superintendentcy of the Eastern Division, Dominion Ex. Co., Montreal, was entertained to dinner at the Montreal Club recently, by his friends and business associates. He was subsequently presented with an illuminated address containing the signatures of the company's chief employes, and a walrus suit case, with a gold watch bracelet for Mrs. Boswell. He was born at Columbus, Ohio, in 1840, and entered the express business in 1861, with the United States Ex. Co., on the Pennsylvania Rd., and served with that company until 1888, when he joined the Dominion Ex. Co.

Mainly About Transportation People.

SIR WM. MACKENZIE sailed from England for Canada, July 24.

LORD STRATHCONA, has contributed \$4,000 to the Y.W.C.A. building fund at Berlin, Ont.

R. BARRY SMITH, chief law clerk, Intercolonial Ry., died at Moncton, N.B., July 16, aged 60.

N. MACDOWELL, of the North Shore Power Ry. and Navigation Co., died at Clarke City, Que., July 14.

SIR DONALD MANN, has given \$1,000 in aid of those who suffered loss in the recent fire at Chicoutimi, Que.

G. M. BOSWORTH, Vice President, C.P.R., has taken a summer cottage at St. Andrews, N.B., for the season.

L. H. McNAMARA, town ticket agent, G.T.R., Walkerton, Ont., has joined the Canadian Ticket Agents' Association.

F. H. PHIPPEN, K.C., General Counsel, Canadian Northern Ry., Toronto, has purchased a 50 acre property at Dixie, near Toronto.

E. N. BENDER, General Purchasing Agent, C.P.R., accompanied by Mrs., and Miss L. Bender, have returned to Montreal, from Great Britain.

MRS. MacTIER, wife of A. D. MacTier, Assistant to the Vice President, C.P.R., Montreal, and family, are spending the summer in Great Britain.

LADY SHAUGHNESSY, and the Misses Shaughnessy are occupying their summer home, Fort Tipperary, St. Andrews, N.B., for the season.

F. L. WANKLYN, M. Can. Soc. C.E., General Executive Assistant, C.P.R., Montreal, arrived in Canada, July 5, from Great Britain with his bride.

A. PRICE, General Superintendent, C.P.R., Calgary, Alta., is building a residence on Prospect Ave., Mount Royal, in that city, at a reported cost of \$20,000.

J. G. SCOTT, ex-General Manager Quebec and Lake St. John Ry., and Mrs. Scott, left Quebec, July 4, for a summer vacation at Carleton, Baie des Chaleurs.

J. J. NICKSON, who carried out the first contract for the C.P.R. Irrigation project at Calgary, Alta., at a cost of about \$2,000,000, died at Vancouver, July 10, aged 64.

MRS. R. S. MCCORMICK, wife of the Chief Engineer, Algoma Central and Hudson Bay Ry., died June 16 and was buried at Indianapolis, Ind. She left a baby daughter and son 4½ years old.

SIR WM. WHYTE, G. F. Galt and A. M. Nanton are reported to have been appointed by the Hudson's Bay Co., as a local board at Winnipeg, to supervise its business in Canada.

A. W. SMITHERS, Chairman of the Board, G.T.R., is expected in Montreal, early in August, for the purpose of making his annual inspection of G.T.R. and of the G. T. Pacific Ry.

J. N. HILL, Vice President, Northern Pacific Ry., New York, and son of J. J. Hill, of the Great Northern Ry., has resigned, and it is stated, he will spend a long vacation in Europe.

L. R. JOHNSON, M. Can. Soc. C.E., Superintendent Angus shops district, C.P.R., left Montreal for Europe, July 5 on the company's business and is not expected back for some time.

HON. F. COCHRANE, Minister of Railways and Canals, has been nominated to represent the Dominion Government at the International Road Congress in London, Eng., in June, 1912.

H. L. DRAYTON, K.C., who has been appointed Chief Commissioner, Board of Railway Commissioners, has, preparatory to taking up residence in Ottawa, sold his house in Toronto for about \$20,000.

W. F. PAGE, who entered G.T.R. ser-

vise in 1852, at Montreal, and who was one of the engine drivers on trains from Montreal westward when traffic was opened in 1855, died at Brockville, Ont., July 7.

The lake near Aldermere B.C., which has hitherto been known as Chicken Lake, is to be named Kathlyn Lake, in honor of the daughter of W. P. HINTON, General Passenger Agent, Grand Trunk Pacific Ry.

"If there were a competition at the Olympic games for ocean travellers, Canada might well have entered SIR WILLIAM MACKENZIE with a fair expectation of winning first place."—Toronto Mail and Empire.

T. HALL was presented with a silver tea set by the employees of the Michigan Central Rd., building department, St. Thomas, Ont., on his recent promotion to be Assistant General Superintendent of Buildings at Jackson, Mich.

G. STEPHEN, General Freight Agent, Canadian Northern Ry., Winnipeg, was mentioned in Canadian Railway and

P290
J. A. Glassford,
Terminals Manager, Fort Garry Union
Station, Winnipeg.

Marine World for July, as having been born in Montreal, July 5, 1870. The year should have been given as 1876.

H. P. DWIGHT, President, Great North Western Telegraph Co., Toronto, died July 4, aged 84. In our last issue, we gave some details of his illness, with biographical data. Mrs. Dwight, who had been ill for a few days, died July 14, aged 77.

W. B. SMITH, General Manager, Dominion Transport Co., Montreal, who celebrated his 83rd birthday recently, entered the Shedden Forwarding Co.'s service at London, Ont., in 1855, and established the D.T.C. at Montreal on the organization of the C.P.R.

G. McL. BROWN, European Manager, C.P.R., London, Eng., and Mrs. Brown, arrived in Montreal from England July 13. After spending a few days in Montreal, Mrs. Brown went to Hamilton to visit relatives, and Mr. Brown left on a trip to the Pacific coast.

G. H. HAM, head of the C.P.R.'s publicity department, was entertained at dinner in Montreal recently, by the Brit-

ish manufacturers who have been touring Canada and was presented with a gold cigarette case, in appreciation of his services during their trip.

W. P. CHAPMAN, Resident Engineer, Mackenzie, Mann and Co., Toronto, who was married, recently, to Miss Chapman, of Toronto, was presented by the staff, with a cut glass service.

W. H. FLYNN, was presented with an address and a gold watch and chain, by the employees of the mechanical department of the Michigan Central Rd. in Canada, on his recent removal from St. Thomas, Ont., to take up his new duties as Superintendent of Motive Power at Detroit, Mich.

L. GLEASON, travelling expert, Galena-Signal Oil Co., who at one time had his headquarters in Canada, but is now located in Chicago, made his yearly business trip to Newfoundland early in July, and then sailed from St. John's for England for a holiday, intending to return to Chicago early in September.

H. M. KING, Chairman of the London and Dominion Trust Co., London, Eng., returned to Montreal July 19, from Alberta, where he had been in the interests of the Alberta, Peace River and Eastern Ry., which his company is arranging to finance. Mr. King is returning to London, to complete the arrangements.

H. E. FARRELL, who has been appointed Vice President, St. Louis Southwestern Ry. of Texas, in charge of freight traffic, was some years ago, in the service of the Detroit, Grand Haven and Milwaukee Ry., and the Great Western Ry. of Canada, at Detroit, Mich., both of which lines now form part of the G.T.R. system.

C. W. BURPEE, Superintendent, District 1, Atlantic Division, C.P.R., was entertained at a smoking concert at McAdam Jct., N.B., July 10, and presented with two travelling bags and a cheque for \$410, by the officials and employees of the division, on his transfer to Toronto, as Superintendent, District 1, Ontario Division.

C. D. WARREN, of Toronto, and C. E. A. CARR, of New Orleans, La., formerly of Quebec, are President and Vice President respectively of the New Orleans and Western Ry. Co., which has been incorporated at New Orleans, under the Louisiana State laws, with an authorized capital of \$1,500,000 and very extensive powers.

J. H. TELFER, who retired from the position of Weighing Inspector, G.T.R., Toronto, July 1, after 46 years continuous service with the company, was presented with a silver tea service by his fellow officials, recently, the presentation being made at the Canadian Freight Association's annual meeting at Lake Champlain, N.Y.

J. B. INGERSOLL was presented with a gold watch and chain by the staff at the Lake Buntzen generating station, and a club bag by the men of Department B., of the British Columbia Electric Ry. July 13, on his leaving that company's service to take up the duties of his new position with the Kootenai Power and Construction Co., Spokane, Wash.

GEORGE B. WILLIAMS, until recently Car Service Agent, Manitoba Division, C.P.R., has joined the Railroaders' Investment Co., of which Alex. Shields, formerly General Master Mechanic, Canadian Northern Ry. is the President. The company has its head office at Winnipeg, and its operations will extend over the entire Dominion, as agencies are being established in the prominent centres.

J. D. BEATTY, who died at Sarnia, Ont., July 14, aged 74, was connected with steamship interests on the Great Lakes for several years, and was one of the founders of the North West Transportation Co., operating between Sarnia and Duluth, being General Manager until its absorption by the Northern Navigation Co. in 1902. Up to within a few

months of his death, he was President, Sarnia St. Ry. Co.

H. W. MILLS, Manager, Sarnia Street Ry., and Town Ticket Agent, G.T.R., died at Sarnia, Ont., June 6, aged 62. The funeral, under Masonic auspices, was largely attended. Flowers were sent by the Canadian Ticket Agents' Association, of which he was a member for many years, and the Association was represented by its Secretary, E. de la Hooke. This item was written for our last issue, but was left out by an oversight.

R. A. SMITH, of Osler and Hammond, brokers, etc., Toronto, who was killed in an automobile accident July 17, on coming to Canada some 30 years ago from Scotland, entered railway service as a clerk in the old Northern Ry.. At the time of his death he was a director of the Toronto Ferry Co., and of the Victoria Rolling Stock and Realty Co. of Ontario. At one time he was secretary of the Qu'Appelle, Long Lake and Saskatchewan Railroad and Steamboat Co.

HON. F. COCHRANE, Minister of Railways, left Ottawa, June 26, on a trip of inspection of the railways in north western Canada. He arrived in Winnipeg July 3, after having visited North Bay, Sault Ste. Marie and Fort William, Ont., and went on to Vancouver, and thence to Prince Rupert, B.C. He is expected back in Winnipeg early in August, and proposes to begin an inspection of the route of the line under construction to Hudson Bay, Aug. 10, expecting to return to Ottawa, via the Hudson Straits.

MRS. BRYDGES, who died at Winnipeg, July 7, was the widow of the late C. J. Brydges, at one time the most important railway official in Canada. He was appointed Managing Director, Great Western Ry. of Canada in 1853, and was subsequently General Manager of the Grand Trunk Ry. and General Superintendent of Government Railways, respectively. He was one of the commissioners in charge of the building of the Intercolonial Ry., and in 1878 was appointed Land Commissioner, Hudson's Bay Co., at Winnipeg.

B. W. FOLGER, who recently retired as General Manager, Niagara Navigation Co., Toronto, on its being taken over by the Richelieu and Ontario Navigation Co., was presented with a loving cup and travelling bag, and a travelling bag for Mrs. Folger, by the officials and employees of the company. The presentations were made by S. J. Murphy, and A. J. Woodward, formerly Travelling Passenger Agent, and Superintendent Engineer, respectively. It is stated that Mr. Folger will probably leave Toronto for New York in the fall.

C. H. BOOTH, whose appointment as Local Freight Agent, Midland Ry. of Manitoba, Winnipeg, was announced in a recent issue, was born at Banff, Scotland, Feb. 16, 1882, and entered railway service, July 1900, since when he has been, to June, 1902, general clerk, C.P.R., Winnipeg; June 1902 to Aug. 1904, billing clerk, Canadian Northern Ry., Winnipeg; Aug. 1904, to Apr. 1906, chief billing clerk, same road; Apr. 1906 to June 1907, inward rate clerk, same road; June 1907 to May 1908, chief rate clerk, same road; May 1908 to Oct. 1909, accountant, same road; Oct. 1909 to May 15th, 1912, assistant local freight agent, same road.

NICOL KINGSMILL, K.C., who died at Toronto, July 21, was born Sept. 30, 1834, and was the youngest son of the late Col. Kingsmill, who served in the Peninsular war, and was afterward sheriff of Niagara, and later postmaster of Guelph, Ont. Nicol Kingsmill was senior partner of the firm of Kingsmill, Saunders, Torrance and Kingsmill, Canadian solicitors for the Michigan Central Rd., and was a director of the Canada Southern Ry., and subsidiary companies, and also of the Toronto, Hamilton and Buffalo Ry. Rear Admiral C. E. Kingsmill, of the

Canadian Naval Department, is a nephew, and W. B. Kingsmill, of the firm mentioned above, is a son.

D. F. MAXWELL, M. Can. Soc., C.E., whose portrait appears in this issue, has been professionally connected for the last 30 years with various railways and other public works in the Maritime Provinces, as well as with several railways in the New England States. During the past eight years he has been wholly engaged in railway work in New Brunswick, four years of that time having been spent on location and construction on the National Transcontinental Ry., and the balance in charge of surveys for the St. John Valley Railway and the Fredericton and Grand Lake Coal and Ry. Co. He was recently appointed Engineer of Railways for the New Brunswick government.

JAMES MILNE, heretofore Superintendent Canadian Salt Co.'s works at Windsor, Ont., and Consulting Engineer, Sandwich, Windsor and Amherstburg Ry. has been appointed Electrical and Mechanical Engineer for the city of Toronto, at a salary of \$5,000 a year. He was born in Scotland some 45 years ago, and

P291 D. F. Maxwell,
Engineer of Railways for the New Brunswick Government.

has been in Canada for about 20 years. Soon after coming to Canada he was appointed teacher of mechanical and electrical engineering in Toronto Technical School and was subsequently in the service of the Toronto Incandescent Lighting Co., of the Jones Underfeed Stoker Co., and the British Columbia Electric Ry.

W. J. PICKRELL, whose appointment as Master Mechanic, District 1, Ontario Division, C.P.R., West Toronto, Ont., was announced in a recent issue, was born at London, Ont., Sept. 15, 1880, and entered C.P.R. service, Jan. 1, 1899, since when he has been, to July 1, 1901, in the West Toronto shops; July 1, 1901 to Nov. 1, 1904, fireman; Nov. 1, 1904, to July 7, 1905, travelling fireman; July 7, 1905 to Aug. 1, 1907, driver; Aug. 1, 1907 to Apr. 15, 1908, assistant Road Foreman; Apr. 15, 1908 to May 10, 1910, driver; May 10, to Dec. 16, 1910, rule instructor; Dec. 16, 1910, to Apr. 9, 1912, driver; Apr. 9, to May 15, 1912, acting District Master Mechanic, District 3, Ontario Division, West Toronto.

K. J. BURNS, whose appointment as Assistant General Freight Agent, Great

Northern Ry., Vancouver, B. C., was announced in our last issue, was born at Rochester, Eng., Oct. 11, 1878, and arrived in Canada in 1882. He entered railway service June 1893, since when he has been, to Feb. 1898, stenographer, C. P. R., Victoria, B. C.; Feb. to June, 1898, second purser, C. P. R. s. s. Empress of China; June to Oct. 1898, ticket clerk, Great Northern Ry., Victoria, B. C.; Oct. 1898 to May 1900, freight solicitor, same road, Vancouver, B. C.; May 1900 to May 1902, General Agent, same road, Tacoma, Wash.; May 1902 to May 1905, General Agent, same road, Victoria, B. C.; May 1905 to June 1, 1912, General Agent, same road, Vancouver, B. C.

T. McNABB, who resigned his position as Master Mechanic, Alberta Railway and Irrigation Company in May, 1911, was, in view of his long and efficient services, given leave of absence on full pay until the company's lines were taken over recently by the C.P.R. After travelling during the greater part of the past twelve months, Mr. McNabb has retired to his Rockyford ranch in Alberta, which he established in 1902, and looks forward to a life of comparative ease after 49 years continuous railway service with two companies. He is one of the oldest subscribers to this paper, and writes: "Please continue to send me The Railway and Marine World, as I do not wish to get entirely out of touch with the old associations. I congratulate you on the continued improvement in your paper."

E. LAIT, who has been appointed General Yardmaster, Winnipeg Joint Terminals, was born at Toronto, Aug. 23, 1889, and entered railway service, July 9, 1902, since when he has been, to Apr. 3, 1904, car checker, C.P.R., Toronto; Apr. 3, 1904 to Aug. 1, 1905, car checker, Canadian Northern Ry., Winnipeg; Aug. 1, 1905 to Oct. 25, 1907, night terminal clerk, same road; Oct. 25, 1907 to Jan. 9, 1909, freight brakeman, same road; Jan. 15, 1909, to Nov. 16, 1910, switchman, same road; Nov. 18, to Dec. 19, 1910, brakeman; Chicago and North Western Ry., Chicago, Ill.; Dec. 26, 1910, to Sept. 14, 1911, switchman, same road; Sept. 15, to Nov. 18, 1911, night Yardmaster, Canadian Northern Ry., Winnipeg; Nov. 19, 1911, to June 20, 1912, switchman, same road; June 20 to June 28, 1912, Night Yardmaster, Winnipeg Joint Terminals.

H. J. BEEMER, who died in London, Eng., towards the end of June, was born at Honesdale, Pa., in 1848. He commenced his railway career as a foreman for Smith and Ripley, New York, who brought him to Canada. One of his first works as a contractor was the railway bridge at Ottawa, followed by some portions of the Dufferin improvements at Quebec. He was Managing Director, Quebec and Occidental Ry. in 1887, and later built the water works in Quebec city. His most important works after that were the Ottawa and Gatineau Ry., the Pontiac Pacific Jct. Ry., and the Quebec, Montmorency and Charlevoix Ry., and the Montreal and Western Ry. In 1895 he made a contract with the Quebec city council for the construction of an electric railway there. In 1905 he left Canada for the United States and for some time was engaged in mining in Arizona.

A. C. GRAY, M. I. M. E. (Eng.), whose appointment as Superintendent of Motive Power, Reid Newfoundland Co., St. John's Nfld., was announced in our last issue, served a five years apprenticeship with Neilson and Co., now the North British Locomotive Co., Glasgow, Scotland, and entered North British Ry. service there, as a running shed fitter. He was subsequently, Locomotive Foreman, Chief Assistant Locomotive, Carriage and Wagon Superintendent, and General Workshop Superintendent, Southern Brazilian Ry., Rio Grande de Sul, Brazil, and on the sale of the railway, he was retained by the new management as Chief

Mechanical Engineer and Manager of Rolling Stock. Other positions held by him are, Engineer, to report on the Longitudinal Ry., Chili, for the Chilean Government; Chief Consulting Engineer, Hamburg South American Steamship Co.; Honorary Engineer, Customs Department, Rio Grande de Sul, Brazil; Assistant Manager and Chief Engineer, Rasselpur Tea Co., Sylket, India.

J. H. CALLAGHAN, General Storekeeper, C.P.R. Eastern Lines, Montreal, who died recently, was buried at Brownville Jct., Me., July 3, when the funeral was attended by chiefs of the operating department from various points. C. Murphy, General Superintendent of Transportation represented the management, L. R. Johnson, General Superintendent, Angus Shops District, the locomotive and car departments; G. E. Hall, Assistant General Storekeeper, the stores department; H. Ferguson, the purchasing department, and C. Malcolm, the audit department. W. Downie, General Superintendent, Atlantic Division, and H. C. Grout, Superintendent, Montreal, also attended. Mr. Callaghan entered C.P.R. service 26 years ago, as storekeeper during the construction of the road through Maine, being the first resident storekeeper at Brownville Jct. He was afterwards moved to McAdam Jct., N.B., then Farnham, Que., and later to Montreal, where he eventually became General Storekeeper. He was widely known throughout Canada and the U.S.

LACEY R. JOHNSON, M. Can. Soc. C.E., who has been appointed General Superintendent Angus Shops District, C.P.R., Montreal, and whose portrait appears in this issue, was born at Abingdon, Berks, Eng., June 22, 1855, and educated at the Grammar School, there. He entered railway service as an apprentice at the Great Western Ry. works, Swindon, Wilts., June 1, 1870, and was Chief Engineer and Foreman of Mechanics at the Woolwich Arsenal, Jan. 1 to Aug. 1876, and fitter and erector Sept. 1876 to Nov. 1878; Manager, Davis and Sons' engineering works, London and Abingdon, Nov. 1878 to Aug. 1879. In Sept. 1879 he went to India as draughtsman on the Scinde, Punjab and Delhi Ry., and was subsequently foreman of machine and erecting shops there. He left India on account of health, Mar. 1882, and entered G.T.R. service at Montreal as draughtsman, June 1882, and joined the C.P.R., Nov. 2, 1882, since when he has been, to Nov. 1885, General Foreman at Carleton Jct.; Nov. 1885 to May, 1886, Assistant Master Mechanic, Eastern Division, Chapleau, Ont.; May 1886 to Apr. 1901, Master Mechanic, Pacific Division, Vancouver, B.C.; and from the commencement of the trans-Pacific service, his jurisdiction extended over the engineering department of the vessels, during which time he spent three winters in Hong Kong superintending alterations and repairs to the company's vessels; Apr. to Sept. 1901, on the purchase of the Canadian Pacific Navigation Co. by the C.P.R., he was Superintending Engineer, of the combined fleets, which position was severed from the locomotive and car department; Sept. 1, 1901 to July 1, 1912, Assistant Superintendent of Motive Power, C.P.R., Montreal.

Willard Kitchen Co., Ltd., railway contractors, Grand Falls, N.B., writes:—"We think The Railway and Marine World a first-class paper."

The steamboat Columbia, engaged in the coal trade between Oswego, N.Y., and Montreal, was destroyed by fire at Ogdensburg, July 6.

The British steamship *Wilhelmina*, bound from Quebec to Yarmouth, Eng., ran on the rocks at Peter's River, Nfld., June 30, and became a total wreck.

The name of Dredge No. 4, formerly owned by the Montreal Harbor Commissioners, has been changed by order in council to Manley and Co. No. 1.

Surveying Instruments-

By W. L. Mackenzie, M. Can. Soc. C. E., Bridge Engineer, Canadian Northern Ry.

Following is a summary of an address delivered before the Engineering Society, Manitoba University:—

The best tripod head is that which is strongest to resist torsional stress. The lugs should extend well down between the cheeks; the legs should fit close together when folded, and each should preferably be of one solid piece of wood.

The levelling screws should be of large diameter and easily accessible. They can with advantage be covered with chamois in winter. Personally, I prefer a 4 screw instrument on account of the increased rigidity it offers. For 3 screw instruments wing nuts should be used to clamp the screws when levelled up. Keep the levelling screws and centres clean and free from grit, using a little of the best watch oil for this purpose. In winter it is best to remove all oil.

For all ordinary purposes, including railway work, a circle graduated to minutes is sufficient, and if further accuracy

P292 A. C. Gray,
Superintendent of Motive Power, Reid Newfoundland Co.

is required, it may be obtained by repetition. The compass needle is little used except for checking deflections; a thin, light needle is desirable. The U type of standard is the most rigid; it should be very firmly fastened.

Inverting telescopes are decidedly better than erecting, giving more light, longer focus and better definition. Stadia hairs should be fixed and not adjustable. In examining an instrument, always test the object glass slide. It should be ground to an accurate fit, and if it is found to shake, good work cannot be done. The object glass should be achromatic and free from spherical aberration. The telescope should be tested for power. The sensitiveness of the plate bubbles should not be less than 1-10th inch for one minute of arc.

For a vertical circle a good type is a 60° arc attached to the outside of the standard and a vernier arm attached to the end of the horizontal arms. If a whole vertical circle is used, and it becomes bent, the whole instrument is put out of commission until the circle has been removed and straightened.

Many of the above remarks apply to

levels also. The dumpy, although a little more troublesome to adjust, is much to be preferred to the wye level, which is easier to adjust, but usually needs adjusting oftener. I would refer those requiring further information to Prof. I. O. Baker's comprehensive book on Surveying Instruments.—Manitoba Engineer.

Railway Finance, Meetings, Etc.

Atlantic and Lake Superior Ry.—A meeting of the holders of certificates of participation in the A. and L.S. Ry. Trust Fund was held in Montreal, July 18, to authorize the trustees to be represented and to vote in favor of resolutions submitted at a meeting of shareholders of the Quebec Oriental Ry. (Matapedia section), called for July 18; to authorize the trustees to appoint the first committees of the bondholders in accordance with the respective trust deeds; to make alterations in constitution for the management of the trust fund by authorizing the election of a Vice Chairman, and to enable general meetings to be held in Paris, France; and to appoint an additional member to the committee of management.

Kingston and Pembroke Ry.—After the transaction of the regular business at the annual meeting of shareholders at Kingston, Ont., Aug. 14, a special meeting will be held to consider the expediency of leasing the line to the C.P.R., to approve of the terms, conditions and form of lease; and to decide upon the means to be adopted for raising funds to retire outstanding mortgage debentures; to authorize an issue of bonds and to approve of the terms of mortgage to secure the repayment of any bonds that the directors may be authorized to issue.

Morrissey, Fernie and Michel Ry.—Press reports state that the operations of the Crows Nest Pass Coal Co., for 1911, showed a net loss of \$200,654. The company owns the M.F. and M. Ry., and it is said that the result of the operation of the line for 1911 showed a net loss of \$18,299. The amount of bonds outstanding is \$27,500, against \$37,500, at the end of 1910.

Rutland Rd.—The United States Supreme Court at New York gave a decision July 5, continuing the temporary injunction restraining the New York, New Haven and Hartford Rd. from acquiring the majority stock of the Rutland Rd. from the New York Central and Hudson River Rd. The court is of opinion that the proposed transfer is in violation of the Sherman law.

Temiscouata Ry.—Gross earnings for April, \$21,148; expenses, \$14,381; net earnings, \$6,767.

An Ottawa press dispatch of July 11, states that the Dominion Government has decided to call for tenders, shortly, for the construction of important harbor improvements at Victoria. It is stated that the work will cost over \$1,000,000.

The recent newspaper report that J. T. Davie and Son, Levis, had disposed of their shipbuilding and repair plant, is incorrect. The salvage plant, consisting of the steamboat *Lord Strathcona*, the schooner *G.T.D.*, with pumps, etc., were sold to the Quebec Salvage and Wrecking Co., Ltd., Montreal, as mentioned in a previous issue.

The Fort William Elevator Co., Ltd., has been incorporated under the Dominion Companies Act, with \$500,000 capital and office in Winnipeg, to carry on a general elevator and grain warehouse business, and in connection therewith to own and operate steam and other vessels, and to conduct a general navigation business. The incorporators are, D. Horne, H. E. Swift, G. H. Yule, W. E. Davidson, M. M. Perdue, Winnipeg.

Transportation Appointments Throughout Canada.

The information under this head, which is almost entirely gathered from official sources, is compiled with the greatest care, so as to ensure absolute accuracy. Anyone who may notice any error in our announcements will confer a favor by advising us.

Board of Railway Commissioners.—H. L. DRAYTON, K.C., heretofore Counsel for the city of Toronto, has been appointed Chief Commissioner, vice J. P. Mabey, deceased.

Canadian Northern Ontario Ry.—R. A. BALDWIN, chief draughtsman, Mackenzie, Mann & Co., Ltd., has also been appointed Resident Engineer Canadian Northern Ontario Ry., Toronto-Niagara line. He is also in charge of the betterments being done on the Bay of Quinte Ry.

C. T. DELAMERE, has been appointed Assistant District Engineer, Port Arthur District, Sudbury-Port Arthur Line, vice A. J. Isbister, promoted to District Engineer, as announced in our last issue. Office, Port Arthur, Ont.

Canadian Northern Ry.—W. PHILLIPS, who was recently appointed European Traffic Manager, with office at London, Eng., has announced the following distribution of territory:—

W. J. CARTMEL, General Passenger Agent, Canadian Northern Steamships, in charge of all business originating in Europe. Office, London, Eng.

F. S. JONES, District Agent, Freight Department, C.N.R., and Freight and Passenger Departments, C.N. Steamships. Office, Glasgow, Scotland.

G. E. COWIE, District Agent, Freight Department, C.N.R., and Freight and Passenger Departments, C.N. Steamships. Office, Liverpool, Eng.

A. T. SHAW, District Agent, Freight Department, C.N.R., and Freight Department, C.N. Steamships. Office, Birmingham, Eng.

A. J. ADAMS, District Agent, Freight Department, C.N.R., and Freight Department, C.N. Steamships. Office, Bristol, Eng.

R. W. ROME, District Freight Agent, C.N.R., and C.N. Steamships. Office, London, Eng.

F. E. BIRCH, District Agent, Passenger Department, C.N. Steamships. Office, Birmingham, Eng.

C. R. SHEPHERD, District Passenger Agent, C.N. Steamships. Office, Bristol, Eng.

Canadian Pacific Ry.—H. C. GROUT, heretofore Superintendent, District 1, Ontario Division, Toronto, has been appointed Superintendent, District 1, Atlantic Division, vice C. W. Burpee, transferred to Toronto. Office, St. John, N.B.

D. L. JONES, heretofore District Master Mechanic, Districts 1 and 2, Atlantic Division, McAdam Jct., N.B., has been appointed acting Master Mechanic, Atlantic Division, during the absence on sick leave, of C. R. Ord. Office, McAdam Jct., N.B.

F. GRANT, heretofore District Master Mechanic, Brownville Jct., Me., has been appointed acting District Master Mechanic, Districts 1 and 2, Atlantic Division, vice D. L. Jones, promoted. Office, McAdam Jct., N.B.

LACEY R. JOHNSON, M. Can. Soc., C.E., heretofore Assistant Superintendent of Motive Power, Angus Shops, has been appointed General Superintendent, Angus Shops District. Office, Montreal.

He will have general charge of the company's property within the Angus shops district, including the construction of new buildings, and the maintenance of those already constructed, the force engaged in the maintenance of tracks and buildings, yard gangs, and engine men, police force and fire protection. He will also have direct charge of the operation of the power and heating plants, and the maintenance of power and heating lines throughout all premises. He will have charge of apprentice instruction, St. John Ambulance Association work, and

such matters as may from time to time be assigned to him.

H. OSBORNE, heretofore Superintendent, Locomotive Department, Angus Shops, Montreal, has been appointed Assistant Superintendent of Motive Power, vice L. R. Johnson, transferred to other duties. Office, Montreal.

G. E. HALL, Assistant General Storekeeper, Eastern Lines, Montreal, is carrying out the duties of General Storekeeper, pending the appointment of a successor to the late J. H. Callaghan.

C. W. BURPEE, heretofore Superintendent, District 1, Atlantic Division, St. John, N.B., has been appointed Superintendent, District 1, Ontario Division, vice H. C. GROUT, transferred to St. John. Office, Toronto.

R. B. RIPLEY, heretofore Engineer in charge of bridge repairs and standardization of grade, Dominion Atlantic Ry., Kentville, N.S., has been appointed Assistant Engineer in charge of grade separation, C.P.R., North Toronto, Ont.

H. B. STEVENS, heretofore Chief Dispatcher, White River, Ont., has been appointed Chief Dispatcher, District 1, Lake

Lacey R. Johnson, M. Can. Soc. C.E.,
General Superintendent, Angus Shops District, Canadian Pacific Railway.

Superior Division, vice R. T. Moran, transferred. Office, Sudbury, Ont.

T. J. ARMSTRONG, heretofore Roadmaster, Webbwood subdivision, Lake Superior Division, has been appointed Roadmaster, Sudbury subdivision, Lake Superior Division, vice L. B. Copeland, transferred. Office, Sudbury, Ont.

R. SHANKS, Roadmaster, Algoma subdivision, Lake Superior Division, Sault Ste. Marie, Ont., has had his territory extended to include the Webbwood subdivision, T. J. Armstrong having been transferred to the Sudbury subdivision. Office, Sudbury, Ont.

J. H. BOYLE, heretofore Assistant Superintendent, District 4, Eastern Division, Ottawa, has been appointed Superintendent, District 3, Lake Superior Division, vice J. H. Hughes. Office, Schreiber, Ont.

N. E. BROOKS, Division Engineer, Calgary, Alta., has been appointed acting General Superintendent, Alberta Division, during the absence on leave of A. Price. Office, Calgary.

J. ROBERTSON, heretofore Resident Engineer, Cranbrook, B.C., has been ap-

pointed Resident Engineer, Calgary, Alta., vice T. J. Brown, transferred.

W. H. GORDON, heretofore Bridge and Building Master, Medicine Hat, Alta., has been appointed Trainmaster, Red Deer, Alta. This is a new position.

N. E. BROOKS, Division Engineer, Calgary, has been appointed acting General Superintendent, Alberta Division, relieving A. Price, who is on leave of absence.

T. J. BROWN, heretofore Resident Engineer, Calgary, Alta., has been appointed Resident Engineer, Cranbrook, B.C., vice J. Robertson, transferred.

W. E. HAYWARD has been appointed Locomotive Foreman at North Bend, B. C., vice G. H. Tedlock, resigned.

Dominion Atlantic Ry.—G. G. HARE, heretofore Engineer, Kingston and Pembroke Ry., Kingston, Ont., has been appointed Engineer of Bridges, D.A.R. Office, Kentville, N.S.

Esquimalt and Nanaimo Ry.—H. E. BEASLEY, heretofore Superintendent, has been appointed General Superintendent. Office, Victoria, B.C.

J. GOODFELLOW, heretofore Assistant Superintendent, has been appointed Superintendent, vice H. E. Beasley, promoted. Office, Victoria, B.C.

M. S. WHEATLEY, heretofore Mechanical Foreman, has been appointed Master Mechanic. Office, Wellington, B.C.

Fort Garry Union Station, Winnipeg.—E. LAIT, has been appointed General Yardmaster, Winnipeg Joint Terminals, vice G. A. Templeman, resigned to re-enter Canadian Northern Ry. service.

JAS. MOORE has been appointed Car Foreman, Winnipeg Joint Terminals, in charge of car inspectors or other Car Department forces.

W. LAMPORT has been appointed Assistant Yardmaster, Winnipeg Joint Terminals, in charge of engineers and firemen, and such other duties as may be assigned to him by the General Yardmaster.

JAMES TODD has been appointed station master, Winnipeg Joint Terminals, vice J. M. Bannerman, resigned.

Grand Trunk Pacific Ry.—J. P. KIRKPATRICK, heretofore Trainmaster, Districts 31 and 32, Ottawa Division, G.T.R., Ottawa, has been appointed Superintendent, G.T.P.R., with jurisdiction over the Melville-Regina, Regina-Boundary and Regina-Moose Jaw lines, vice W. B. Cronk, resigned. Office, Regina, Sask.

The following agents have been appointed:—Manaki, Ont., J. A. Foran; Waldron, Sask., B. Simmons; Yorkton, Sask., C. W. Hemsworth; Lestock, Sask., S. E. Hurley; Bradwell, Sask., H. G. House; Leney, Sask., T. W. Fleming; Stoney Plain, Alta., N. F. Gale.

Grand Trunk Ry.—E. S. COOPER, heretofore Chief Dispatcher, Districts 4 and 5, Eastern Division, Montreal, has been appointed acting Trainmaster, Districts 1 and 2, Eastern Division, vice J. W. Farrell, granted extended leave of absence on account of ill health. Office, Island Pond, Vt.

J. H. JOHNSTON, heretofore Master of Bridges and Buildings, Ottawa Division, Ottawa, has been appointed Master of Bridges and Buildings, Eastern Division, vice A. Finckley, retired on pension after 46 years service. Office, Montreal.

O. MASSE, heretofore Night Chief Dispatcher, has been appointed acting Chief Dispatcher, Districts 4 and 5, Eastern Division, vice E. S. Cooper, promoted. Office, Montreal.

F. B. NIXON has been appointed acting night Chief Dispatcher, Districts 4 and 5, Eastern Division, Montreal, vice O. Masse, promoted.

J. CHISHOLM has been appointed Master of Bridges and Buildings, Ottawa Division, vice J. H. Johnston, transferred. Office, Ottawa.

J. S. McADAM, heretofore Chief Dispatcher, Ottawa Division, Ottawa, has

been appointed Trainmaster, Districts 31 and 32, Ottawa Division, vice J. P. Kirkpatrick, transferred to G.T.P.R. service. Office, Ottawa.

H. C. WHITE, heretofore dispatcher, has been appointed Chief Dispatcher, Ottawa Division, vice J. S. McAdam, promoted. Office, Ottawa.

G. A. HARRISON, heretofore telegraph operator, is reported to have been appointed Travelling Passenger Agent for Thousands Islands, vice E. A. Dornan, deceased. Office, Gananoque, Ont.

G. GORDON, heretofore Car Distributor, Toronto Terminals, has been appointed Passenger Yardmaster, Toronto Union Station.

JOHN BOYD has been appointed Weighing Inspector, Toronto, vice J. H. Telfer, retired after 46 years continuous service with the company.

The following agents have been appointed:— St. Laurent, Que., H. Valade; Brockville, Ont. (pass.), W. E. Allan, acting; Winona, Ont., W. E. Cusson; Sarnia, Ont., (freight), and Point Edward, Ont., G. Dench; Sebringville, Ont., J. W. Manning; Greenfield, Ont., J. Shane; Kinnbrun, Ont., W. Hardy; Barrys Bay, Ont., G. A. Thurston; Ravenworth, Ont., N. G. Reynolds.

Great Northern Ry.—L. C. GILMAN, Assistant to the President, has had his office moved from St. Paul, Minn., to Seattle, Wash.

A. WHITNALL has been appointed City Passenger Agent, Vancouver, B.C.

Kingston and Pembroke Ry.—J. A. IRVINE, heretofore in the Construction Department, C.P.R., Montreal, has been appointed Engineer, K & P. Ry., vice G. G. Hare, who has entered Dominion Atlantic Ry. service. Office, Kingston, Ont.

Michigan Central Rd.—B. F. AIKENS has been appointed Purchasing Agent, vice J. F. Farrell, resigned to enter other service. Office, Detroit, Mich.

Northern Pacific Ry.—W. P. CLOUGH, director and member of the executive committee, has been appointed Vice President, vice J. N. Hill, resigned on account of ill health. Office, New York.

Prince Edward Island Ry.—G. A. HUGHES, heretofore train dispatcher, has been appointed Chief Dispatcher. Office, Charlottetown, P.E.I.

Rutland Rd.—F. T. GRANT, heretofore Assistant General Passenger Agent, Boston and Maine Rd., Boston, Mass., has been appointed General Passenger Agent, Rutland Rd., Rutland, Vt., vice C. HARTIGAN, appointed Assistant General Passenger Agent, Lake Shore and Michigan Southern Ry., Chicago, Ill.

Toronto, Hamilton and Buffalo Ry.—F. F. BACKUS, heretofore General Freight and Passenger Agent, has been appointed Traffic Manager. Office, Hamilton, Ont.

J. C. MARTIN, heretofore Assistant General Freight and Passenger Agent, has been appointed General Freight and Passenger Agent.

Canadian Freight Association, Eastern Lines.

At the midsummer meeting of this association, Eastern Lines, at Bluff Point, N.Y., July 10 to 12, the resignation of T. Marshall, Chairman, on his appointment as Manager of the Traffic Department of the Toronto Board of Trade was accepted.

W. R. MacInnes, Freight Traffic Manager, C.P.R., Montreal, on behalf of the association, presented him with a silver tea service as a token of esteem and in appreciation of his services to the association as secretary and chairman.

A. E. Rosevear, Assistant General Freight Agent, G.T.R., Montreal, has been appointed acting chairman, Canadian Freight Association, Eastern Lines, pending the appointment of a successor to Mr. Marshall.

Railway Rolling Stock Notes.

The Intercolonial Ry. has received one postal car from the Nova Scotia Car Works, Halifax.

The G.T.Pacific Ry. has received 73 ballast cars, nos. 392747 to 392819, from the Canadian Car and Foundry Co., Montreal, and 41 flat cars, nos. 361601 to 361641, from the American Car and Foundry Co.

The Canadian Northern Ry. has ordered four Pacific type superheater passenger locomotives, from the Montreal Locomotive Works. They will have cylinders 23 ins. diar., by 28 ins., stroke, driving wheels 69 ins. diar., and will be of a total weight in working order, of 213,000 lbs.

The C.P.R., between June 17 and July 17, ordered the following rolling stock:— five freight refrigerator cars, nine stock cars, nine vans, two wooden flat cars, and one G1 locomotive, from its Angus shops, Montreal; 11 snow ploughs, from the Canadian Car and Foundry Co., Montreal; 1,000 steel frame box cars, from the American Car and Foundry Co.; 25 ten wheel locomotives from the Montreal Locomotive Works, and 25 ten wheel locomotives from the American Locomotive Co., Schenectady, N.Y.

The Canadian Northern Ry., between June 15 and July 15, received the following additions to rolling stock:— two consolidation locomotives, from the Canadian Locomotive Co., Kingston, Ont.; two consolidation locomotives, from the Canada Foundry Co., Toronto; two first class cars, six second class cars, one dining car and 250 box cars, from the Canadian Car and Foundry Co., Montreal; three baggage cars and 150 box cars, from the Crossen Car Co., Cobourg, Ont.; 100 box cars, from the Nova Scotia Car Works, Halifax, N.S., and 47 flat cars from the Rathbun Co.

The C.P.R., between June 17 and July 17, received the following additions to rolling stock:— 100 freight refrigerator cars, 221 stock cars, 42 vans, 62 wooden box cars, one pile driver, five suburban cars, one first class car, eight first class and smoking cars, five dining cars, six sleeping cars, three cafe-parlor cars, and 12 switching locomotives, type U3, from its Angus shops, Montreal; 22 steel frame box cars, 30 ballast cars, 239 coal cars, and 107 flat cars, from the Canadian Car and Foundry Co., Montreal; 67 stone cars from the Nova Scotia Car Works, Halifax; three Rodger ballast ploughs from F. H. Hopkins and Co., Montreal; 19 D10 locomotives, from the Montreal Locomotive Works, and one wrecking crane from the U.S.

Following are chief details of the four ten wheel locomotives, which the Canadian Northern Ry. is having built by the American Locomotive Co., Schenectady, N.Y.:—

Weight on drivers, in working order	149,000 lbs.
Weight of engine total	198,500 lbs.
Weight of tender, in working order	134,000 lbs.
Cylinders, diar and stroke	21 by 28 ins.
Valve gear, type	Walschaert
Driving wheels, diar.	63 ins.
Wheel base, driving	14 ft. 10 ins.
Wheel base, total engine	26 ft. 1 in.
Wheel base, engine and tender	55 ft. 0 1/2 in.
Boiler, type	Wagon top
Boiler, pressure	200 lbs.
Boiler, tubes, no. and diar.	239—2 ins.
Boiler, flues, no. and diar.	24—5 ins.
Heating surface, firebox	180 sq. ft.
Heating surface, tubes	2229 sq. ft.
Heating surface, total	2409 sq. ft.
Superheating surface	408 sq. ft.
Grate area	49 sq. ft.
Capacity, water	5000 imp. gals.
Capacity, coal	12 tons
Superheater	Vaughan-Horsley

Following are the chief details of the 41 Pacific type locomotives, equipped with superheaters of top header double loop type and sectional brick arch, which the G.T.R. is having built by the Montreal Locomotive Works, as mentioned in our last issue:—

Cylinders, diar. and stroke	23 by 28 ins.
-----------------------------	---------------

Driving wheels, diar. and stroke	for 31—69 ins. for 10—73 ins.
Boiler, outside diar., first course	70 1/2 ins.
Firebox, length and width	86 3/4 by 75 1/2 ins.
Tubes, no. and diar.	181—2 ins.
Flues, no. and diar.	24—5 3/8 ins.
Tubes and flues, length	20 ft. 7 ins.
Grate area	50.6 sq. ft.
Wheel base, driving	13 ft. 4 ins.
Wheel base, engine	33 ft. 2 ins.
Wheel base, engine and tender	62 ft. 3 1/2 ins.
Weight on leading truck	40,000 lbs.
Weight on drivers	145,000 lbs.
Weight on trailing truck	38,000 lbs.
Weight, total engine	223,000 lbs.
Weight of tender	144,600 lbs.
Capacity, water	8,000 U.S. gals.
Capacity, coal	10 tons.

Following are chief details of the four ten wheel locomotives, which the Canadian Northern Ry. is having built by the Montreal Locomotive Works:—

Weight on drivers	112,500 lbs.
Weight on truck	41,500 lbs.
Weight of engine, total	154,000 lbs.
Weight of tender	123,400 lbs.
Wheel base, driving	13 ft. 6 ins.
Wheel base, total engine	23 ft. 10 ins.
Wheel base, engine and tender	52 ft. 8 ins.
Tractive power, maximum	24,300 lbs.
Factor of adhesion	4.63
Cylinders, diar. and stroke	20 by 24 ins.
Valves, type and gear	Walschaert
Valves, diar. and travel	12 and 5 1/2 ins.
Driving wheels, diar.	67 ins.
Driving journals	8 1/2 by 10 ins.
Truck, type	Four wheel with swing bolster
Truck journals	5 1/2 by 10 ins.
Truck wheels	30 ins.
Boiler, type	Extended wagon top, radial stay
Boiler, outside diar. front end	58 1/2 ins.
Boiler, outside diar. largest course	65 ins.
Boiler, height over crown, front	27 1/2 ins.
Boiler pressure	170 lbs.
Firebox, length and width	102 1/2 by 41 1/2 ins.
Tubes, no. and diar.	133—2 ins.
Tubes, length	13 ft. 2 1/2 ins.
Flues, no. and diar.	18—5 3/8 ins.
Heating surface, tubes	1241 sq. ft.
Heating surface, firebox	141 sq. ft.
Heating surface, total	1382 sq. ft.
Superheating surface	279.6 sq. ft.
Grate area	29.2 sq. ft.
Tender wheels, diar.	33 ins.
Tender journals	5 1/2 by 10 ins.
Tender wheel base	17 ft. 10 ins.
Tender truck, type	Four wheel pedestal
Tank, type	Water bottom
Capacity, water	5,000 imp. gals.
Capacity, coal	10 tons

J. W. Jordan, Yardmaster, C.P.R., Winnipeg, is being charged with theft from C.P.R. warehouses and cars.

The Great Western Ry. of England has been conducting a series of tests of an electric automatic train control and cab signalling system. On July 5, a test was made over a prepared track, two locomotives being started toward each other, the drivers leaving the cabs before a high speed had been attained. When the locomotives came on the same block, the warning whistles blew, steam was automatically shut off, brakes applied, and they came to a stop, without collision.

NOTICE TO CONTRACTORS.

Tenders will be received by the undersigned for the construction of that portion of the Canadian Northern Pacific Railway on Vancouver Island, known as Division D, extending from Mileage 100, west of Cowichan Lake, to a point on the Alberni canal, a distance of approximately forty miles.

Tenders to include clearing, grubbing, grading, bridges, trestles, culverts, masonry and fencing.

Plans, profiles, specifications and forms of contract may be seen and forms of tender obtained at the offices of Mackenzie, Mann and Co., Ltd., Pemberton Block, Victoria, B.C.

Total work to be completed within one year from the date of the signing of the contract.

Tenders to be received at the offices of Mackenzie, Mann and Co., Ltd., Room No. 713, Metropolitan Building, 337 Hastings Street West, Vancouver, B.C., not later than 12-0 noon on the 10th day of August, 1912, and to be enclosed in sealed envelopes marked "Tender for Construction."

The lowest of any tender not necessarily accepted.

MACKENZIE, MANN & CO., LTD.

Canadian Northern Railway Revision at
Rainy Lake. Ont.

By W. L. Mackenzie M. Can. Soc. C.E., Bridge
Engineer, C.N.R.

The C.N.R. main line from Port Arthur to Winnipeg crosses Rainy Lake at the Narrows near Fort Frances, Ont., on a pile trestle upwards of two miles long. The present structure was completed in 1900, and has served to carry the large traffic up to the present. In constructing the trestle it was necessary to use piles as long as 80 ft., as the lake bottom was rather soft clay. Very little difficulty has been experienced in maintaining the pile trestle, but it was

satisfactory than winter work, as many as 28 soundings to rock bottom being secured in one day. Many of the soundings taken extended to 90 ft. below the surface of the water, the water sometimes being 40 ft. deep, with 50 ft. of clay underneath. The clay varied from a soft ooze to a compact clay in which the sounding rod would only penetrate an eighth of an inch with a 4 ft. drop of the hammer.

Following the taking of the soundings, a contour map of the lake bottom was made and a location for the new line was selected, giving much smaller quantities of fill as compared with any other line. The new line is 15,814 ft. long, 800,000 cu. yds. rock are required for a

The accompanying plan shows the relative positions of the present and revised lines. The profile illustrates the hugeness of the work. The illustrations from photographs on pg. 408, show the barges and girders in use.

Approximate Quantities for Timber Bridges
on the Canadian Northern Railway.

By A. J. Taunton.

These figures refer to bridges on the C.N.R., and must be modified to suit other structures. For pile trestles the piles may be estimated directly from the profile, the deck and caps running at about 2,700 f.b.m. per opening of 14 ft. 9

Canadian Northern Railway Rainy Lake Revision. Plan.

necessary to take continual precautions to guard against trouble. When the lake froze over in the fall, the water was usually higher than later on in the winter, and as the water gradually fell it was necessary to keep the ice cut away from the piles to avoid settlement from the weight of ice. In the spring there was always the possibility of a strong north wind driving the ice against the trestle. However, the latter caused little trouble and any slight damage from this cause was immediately repaired. The increase in traffic during the last few years made it apparent that the trestle must soon be replaced. It was not possible to make an embankment on the present line and keep the line open for traffic at the same time, besides the depth to rock on the pre-

double track embankment, about 95% of this being obtained from an adjacent island. Contractors are using drills operated by compressed air, the power being obtained from the hydro-electric development recently completed at Fort Frances. Steam shovels are employed for loading the rock into cars, and switching locomotives are used between the borrow pit and fill. The contractor has devised an unusual arrangement for building the fills. To obviate the necessity for a trestle, he placed two plate girders 140 ft. long across a supporting barge 32 ft. by 112 ft. by 6 ft. deep, the inner end of these girders being supported by a cross girder 80 ft. long, the ends of the cross girder being in turn supported by two smaller barges 12 ft. by 24 ft. by 5 ft. deep. The two long gird-

in, and a small allowance for dump plank and bracing depending on the height being made. Allow for lengths of pile in ordinary soil 15 ft. more than the height from the ground to cut-off. The iron will be about 60 lbs. per m. The piling on frame trestles is also obtained from the profile. The f.b.m. timber may be approximately obtained by multiplying the area of the opening between end bents, the ground, and the base of rail by a factor K, the value of which may vary from 11 to 13½. For long low trestles K may be as high as 13½, and for short deep ones the low limit (11) will be reached. The ratios of the area of the toe slopes at the ends to the whole area, and the timber in the deck to the total quantity, will considerably influence the value of K. Good guessing on the part

Canadian Northern Railway Rainy Lake Revision. Profile.

sent line was such that the embankment quantities would have been excessive.

In order to choose a new location it was necessary to take soundings to rock over a large area adjacent to the present line. This work was started during the winter with only fair success, owing to the difficulty experienced in handling the sounding rods, as they became quickly coated with ice. The work was continued during the summer, using a barge 22 ft. wide by 34 ft. long, on which was erected a small pile driver with a 75 lb. hammer operated by hand. The sounding was done through a well in the centre of the scow, using extra heavy 1¼ in. steel pipe in 10 ft. lengths for sounding rods. This proved much more

ers are spaced 30 ft. c. to c. and are connected by floor beams on which track stringers are placed to carry cars as they came from the borrow pit. The cars are dumped in the space between the barges, the outer end of the long girders serving as a tail track for empties.

This arrangement has proved entirely satisfactory, and the work has progressed without interruption, the embankment being now about 75% completed.

On making comparison between excavation and embankment quantities it is found that the embankment is almost entirely displacing the clay in the bed of the lake.

of the estimator is necessary; this, combined with experience and judgment, should give very fair approximate results. The iron will be 57 to 60 lbs. per m.

The following figures are for Howe trusses, exclusive of falsework:

Span in feet.	Equivalent D.G.S. Loading.	f.b.m. Timber.	lbs. Iron.
60	Class III.	33,000	13,000
60	" Heavy	42,000	28,000
80	" III.	56,000	40,000
120	" II.	—	58,000

The Ottawa Car Co. is going to build a new and larger plant at Britannia, a suburb of Ottawa.

Birthdays of Transportation Men in August.

Many happy returns of the day to:—

W. E. Bishop, General Agent, Niagara Navigation Co., Hamilton, Ont., born at Brantford, Ont., Aug. 10, 1868.

J. F. Chapman, Manager, Thousand Islands Ry., and Oshawa Ry., Gananoque, Ont., born at Frankford, Hastings Co., Ont., Aug. 25, 1863.

A. E. H. Chesley, General Accountant, Dominion Atlantic Ry., Kentville, N.S., born near Annapolis Royal, N.S., Aug. 27, 1877.

C. H. N. Connell, Engineer Mainten-

C.P.R., St. Louis, Mo., born at Edinburgh, Scotland, Aug. 3, 1857.

J. F. Richardson, Superintendent Telegraphs, British Columbia Division C.P.R., Vancouver, born at Granby, Que., Aug. 23, 1861.

W. G. Ross, President, Quebec Railway, Light and Power Co., born at Montreal, Aug. 6, 1873.

W. Le B. Ross, Local Treasurer, G.T. Pacific Ry., Winnipeg, born at Ottawa, Ont., Aug. 9, 1868.

Major Salt, Car Foreman, C.P.R., Toronto, born at Lichfield, Eng., Aug. 12, 1859.

F. C. Salter, European Traffic Mana-

W. F. Taylor General Storekeeper, Intercolonial Ry., Moncton, N.B., born at Hillsboro, N.B., Aug. 20, 1855.

R. L. Thompson, ex-District Passenger Agent, C.P.R., Toronto, born at Montreal, Aug. 17, 1873.

F. J. Thomson, Marine Superintendent, Canadian Northern Steamships, Ltd., Montreal, born in Cheshire, Eng., Aug. 20, 1876.

F. E. Warren, Division Car Foreman, Ontario Division, C.P.R., West Toronto, Ont., born at Chelsea, Que., Aug. 29, 1872.

W. B. Way, Assistant Superintendent District 3, Eastern Division, C.P.R., Montreal, born at Bowmanville, Ont., Aug. 22, 1867.

E. H. Williams, Locomotive Foreman, Canadian Northern Ry., Brandon, Man., born at West Toronto, Ont., Aug. 26, 1844.

Approval of Route Maps of Railways Under Dominion Jurisdiction

The following route maps have been approved by the Minister of Railways. The date of approval is June 26, except where otherwise stated:—

ALBERTA CENTRAL RY.—Revision from mileage 140 to Yellowhead Pass, 165 miles.

ALBERTA INTERURBAN RY.—Revisions, about 18 miles.

CANADIAN NORTHERN ONTARIO RY.—Through Lincoln and Welland counties, about 30 miles.

From North Toronto, eastward, 7.2 miles.

CANADIAN NORTHERN RY.—Revision from Calgary, Alta., southerly and westerly, about 12 miles.

CANADIAN PACIFIC RY.—From Laggan to Lake Louise, Alta., 3.55 miles. (June 18).

From Estevan, Sask., westerly, 96.5 miles.

Revision of Touchwood Hills branch, 48.8 miles.

From Sedgewick southerly, 23.6 miles.

GRAND TRUNK PACIFIC RY.—Revisions between Calgary and Coutts, Alta., about 45 miles.

Revision of Cutknife branch, about 11 miles.

MONTREAL AND SOUTHERN COUNTIES RY. (Electric).—From Ranelagh station to Laprairie, Que., about 12 miles.

NIAGARA, ST. CATHARINES AND TORONTO RY. (Electric).—From St. Catharines to Niagara-on-the-Lake, Ont., about 14 miles.

From Port Dalhousie to Beamsville, Ont., 12 miles.

NIPISSING CENTRAL RY. (Electric).—From Haileybury to New Liskeard, Ont., about 5½ miles.

Canadian Northern Railway Rainy Lake Revision. Main Borrow Pit.

ance of Way, Canadian Northern Quebec and Quebec and Lake St. John Rys., Quebec, born at Woodstock, N.B., Aug. 26, 1876.

F. Barlow Cumberland, ex-Vice President, Niagara Navigation Co., Port Hope, Ont., born at Portsmouth, Eng., Aug. 5, 1846.

E. L. Desjardins, Assistant Superintendent, Montreal and Ste. Flavie District, Intercolonial Ry., Riviere du Loup, Que., born at St. Jean Port Joli, Que., Aug. 1, 1859.

F. L. Ellingwood, Superintendent Building Construction, C.P.R., Montreal, born at Eastport, Me., Aug. 6, 1863.

G. H. Ham, head office staff, C.P.R., Montreal, born at Trenton, Ont., Aug. 23, 1847.

W. P. Hinton, General Passenger Agent, G.T.P.R., Winnipeg, born at Hintonburg, Ont., Aug. 30, 1871.

R. Kerr, ex-Passenger Traffic Manager, C.P.R., born at Toronto, Aug., 1845.

J. D. McDonald, Assistant Passenger Agent, G.T.R., Chicago, Ill., born at Toronto, Aug. 27, 1855.

T. McHattie, Master Mechanic, Eastern Division, G.T.R., Montreal, born at Dufftown, Banffshire, Scotland, Aug. 8, 1854.

M. K. McQuarrie, Resident Engineer, District 1, British Columbia Division, C.P.R., Revelstoke, born at Sault Ste. Marie, Ont., Aug. 17, 1884.

J. A. Marsh, Trainmaster, British Columbia Electric Ry., New Westminster, B.C., born at Dresden, Ont., Aug. 16, 1876.

W. J. Meakin, Locomotive Foreman, C.P.R., Castor, Alta., born at Toronto, Aug. 22, 1869.

C. Montgomery, Master Mechanic, Pere Marquette Rd., St. Thomas, Ont., born near London, Ont., Aug. 29, 1860.

W. E. Mullins, General Manager, Costa Rica Division, United Fruit Co, San Jose, Costa Rica, born at Stratford, Ont., Aug. 13, 1870.

F. H. Phippen, K.C., General Counsel, C.N.R., Toronto, born at Belleville, Ont., Aug. 26, 1862.

W. M. Porteous, Freight Agent,

ger, G.T.R., and Canadian Ex. Co., London, Eng., born at Sarnia, Ont., Aug. 31, 1863.

W. H. Sample, Master Mechanic, Ottawa Division, G.T.R., Ottawa, born at Altona, N.Y., Aug. 2, 1864.

C. R. Scoles, General Manager, Quebec Oriental Ry., New Carlisle, Que., born at Grantham, Lincoln, Eng., Aug. 27, 1856.

Canadian Northern Railway Rainy Lake Revision, Barges and Girders in use.

S. A. Simpson, Superintendent, Sleeping, Dining and Parlor Cars and News Service, Saskatchewan Division, C.P.R., Moose Jaw, born at Toronto, Aug. 22, 1880.

W. Stitt, General Passenger Agent, C.P.R., Eastern Lines, Montreal, born in Kirkcudbrightshire, Scotland, Aug. 3, 1855.

J. F. Sweeting, Industrial Agent, Natural Resources Department, C.P.R., Calgary, Alta., born at Worthing, Eng., Aug. 20, 1872.

Orders by the Board of Railway Commissioners.

Beginning with June, 1904, we have published in each issue summaries of orders passed by the Board of Railway Commissioners, so that subscribers who have filed our paper have a continuous record of the Board's proceedings. No other paper has done this.

The dates given of orders, immediately following the numbers are those on which the hearings took place, and not those on which the orders were issued. In many cases orders are not issued for a considerable time after the dates assigned to them.

16544. May 15.—Approving location of Windsor, Essex and Lake Shore Rapid Ry., siding, freight shed and station at Essex, Ont.

16545, 16546. May 18.—Authorizing G.T.R. to build siding for Bechtels, Ltd., near Waterloo, and St. Lawrence Starch Co., Port Credit, Ont.

16547. May 20.—Authorizing C.P.R. to build spur for Ontario Rock Co., Belmont tp., Ont.

16799, 16800. June 19, 17.—Approving C.N. Ontario Ry. revised location through Badgerow and Field tps., Nipissing district, mileage 374.58 to 378.96 and through Field, Badgerow and Gibbons tps., mileage 260.47 to 265.92 from Ottawa.

16801. June 17.—Ordering C.P.R. to build farm crossing in Salaberry tp., Que.

16802. June 19.—Authorizing C.P.R. to use interlocking track with G.T.R. at Goderich, Ont., as directed by order 15777, Jan. 8.

16803. June 18.—Further extending to Sept. 30, time for installation by Hui Electric Co. of power brakes on its electric cars required by order 10462, May 3, 1910.

16804. June 17.—Approving proposed change in C.P.R. station at Meath, Ont.

16805. June 18.—Extending to July 15, time for installation by C.P.R. of crossing signs and fences between Swift Current and Neville, Sask., ordered by order 15865, Feb. 1.

16806. June 19.—Approving location of C.P.R. branch from near Laggan station to near its hotel at Lake Louise, B.C.

16807. June 19.—Authorizing G.T. Pacific Ry. to build spur for Great Northern Tannery Co., Edmonton, Alta.

16808. June 19.—Amending order 16589, May 20, re G.T. Pacific Ry. location through Fort William, Ont.

16809. June 19.—Ordering that crossing of G.T. Pacific Ry. by C.P.R. at the dock at Vancouver, B.C., be protected by gates, watchman, to be appointed by C.P.R. and paid by the G.T.P.R.

16810. June 18.—Further extending to Sept. 30, time for completion of overhead bridge by G.T.R. at Rockfield, Que.

16811. June 17.—Ordering that G.T.R. crossing at Bronson Ave., Ottawa, be protected by overhead structure, 20% to be paid from railway grade crossing fund, half remainder by city and half by G.T.R.

16812. June 19.—Approving plan and chart of interlocking plant to be installed by G.T.R. at bridges over St. Lawrence river and Soulanges canal.

16813. June 22.—Amending order 16695, June 7, re approval of portion of Campbellford, Lake Ontario and Western Ry. (C.P.R.) revised location.

16814. June 6.—Ordering G.T.R. within three months to install two sets of gates at King St., and one set at Sherbrooke St., Peterboro, Ont., day and night watchmen to be employed.

16815. June 20.—Amending order 16668, June 1, re crossing at Burrard Inlet, B.C. by substituting Vancouver, Victoria and Eastern Ry. for Vancouver, Westminster and Yukon Ry.

16816. June 11.—Extending to July 15, time for completion of certain work by C.P.R. at King St. crossing, Walkerton, Ont.

16817. June 19.—Authorizing C.N. Ontario Ry. to cross with its Ottawa-Capreol line, Dufresne Road, Ferris tp., Ontario.

16818. June 22.—Authorizing Canadian Northern Ry. to cross public road with its Alaskan Southeasterly line, Saskatchewan.

16819. June 19.—Approving C. N. Ontario Ry. revised location through unsurveyed territory in Alameda District, mileage 208.3 to 211.47 from Sudbury Jct.

16820. June 20.—Authorizing G.T.R. to extend passing track and re-align main line over county line road, Brant tp., Ont.

16821. April 12.—Relieving C.P.R. from erecting fences on certain portions of its Fort William, Ignace and Kenora subdivisions.

16822. June 24.—Authorizing G.T. Pacific Ry. to open for traffic its line between Hinton, mileage 978, and Fitzhugh, mileage 1028, A. Ita.; speed limited to 20 miles an hour.

16823. June 20.—Ordering that city of Montreal be subject to fine of \$25 a day after

June 24, that it is in default of commencing work re Park Ave. subway, required by order 16504, May 13, and \$25 a day after Dec. 15 that is in default of completing same.

16824. June 20.—Extending pending sanction of Governor-in-council of agreements, time for operation of Midland Ry. trains over Canadian Northern Ry. to Winnipeg Terminals, as defined in order 16550, May 20.

16825. June 20.—Extending to Oct. 1, time for completion by C.N.R. of spur into Hudson Bay reserve, Edmonton, Alta.

16826. June 18.—Authorizing C.P.R. to build its Moosejaw northwesterly branch across 34 highways in Saskatchewan.

16827. June 22.—Authorizing C.P.R. to use bridge 69.3 on its Boundary subdivision, B.C.

16828. June 22.—Approving James Bay and Eastern Ry., (C.N.R.) revised location in Roberval tp., Que.

16829. June 20.—Authorizing British Yukon Ry. to open for traffic its branch line from milepost 160 to Pueblo Mine, 13 miles.

16830. June 21.—Approving Edmonton, Dunvegan and British Columbia Ry. revised location, mileage 4 to 14, Alberta.

16831. June 17.—Dismissing application of Publishers Press, Ltd., Montreal, re Bell telephone service.

16832. June 20.—Amending order 14738, Sept. 9, 1911 re C.P.R. subway at Saranac Rd., York tp., Ont., by substituting plan dated Feb. 17, 1912; 20% to be paid from railway grade crossing fund.

16833. June 24.—Approving location of portion of C.P.R. Moose Jaw Southwesterly branch from mileage 37.85 to 64.47, Sask., and authorizing crossing of 22 highways.

16834. June 21.—Authorizing C.P.R. to build four spurs across Symes and Gunns roads, Toronto.

16835. June 24.—Extending to Aug. 31, time for completion of C.P.R. spur for Hanson and VanWinkle Co., Toronto.

16836. June 24.—Relieving C.P.R. from erecting fences on its Lac du Bonnet subdivision.

16837. June 18.—Authorizing C.P.R. to take certain city lands in Toronto, in connection with enlargement of freight terminals, etc.

16838. June 20.—Authorizing railways to dispense with night watchman at C.N. Ontario Ry. and C.P.R. crossing near Ottawa.

16839. June 21.—Authorizing C.P.R. to build extension to siding for Taylor Milling and Elevator Co., Lethbridge, Alta.

16840. June 21.—Authorizing C.P.R. to close highway near mileage 48, Edmonton branch, Alta.

16841. June 22.—Authorizing C.P.R. to build spur for Lethbridge Brewing and Malting Co., and Young Bros., at Macleod, Alta.

16842. June 25.—Approving C.P.R. plan of track elevation at North Toronto, Ont., plan of subway structures for Yonge St. and Avenue Rd. to be filed for approval.

16843. June 17.—Dismissing application of Quebec Rifle Association re C.N.R. stopping trains at Point aux Trembles Range, Montreal.

16844. June 20.—Authorizing C.N. Quebec Ry. to cross C.P.R. with its St. Eustache-St. Jerome line, near St. Augustine.

16845. June 20.—Rescinding order 6301, Feb. 15, 1909, re C.N. Quebec Ry. Montfort branch, in so far as it requires maintenance of agent at Montfort.

16846. June 25.—Approving plans showing track elevation of joint section of C.P.R. and C.N. Ontario Ry. from Summerhill Ave. to Dovercourt Rd., Toronto, except approaches to subways at Yonge St. and Avenue Rd., which must be level; Christie St. subway to be full width of street.

16847. June 19.—Amending order 16498, May 10, re location of G.T. Pacific Branch Lines Co.'s station at Bashaw, Alta.

16848. June 18.—Approving location of G.T. Pacific Branch Lines Co.'s station at Dodsland, Alta.

16849. June 21.—Authorizing G.T. Pacific Branch Lines Co. to build seven spurs in Regina, Sask.

16850, 16851. June 17, 22.—Defining express delivery and collection limits for Shawinigan Falls and Fraserville or Riviere du Loup, Que.

16852. June 24.—Authorizing Toronto, Hamilton and Buffalo Ry. to build spur for Barton Lumber and Supply Co., Hamilton, Ont.

16853. June 11.—Dismissing application of city of Ottawa for removal of G.T.R. tracks from Preston street.

16854. June 21.—Ordering G.T.R. within 90 days to install electric bell at Brock St., Uxbridge, Ont., 20% to be paid from railway grade crossing fund.

16855, 16856. June 21.—Ordering Michigan Central Rd. within 60 days to install electric bells at Hornby St. and East St., Springfield, Ont., 20% to be paid from railway grade crossing fund.

16857. June 11.—Authorizing G.T.R. to build

spur for Export Lumber Co., crossing Preston St., Ottawa, Ont.

16858. June 24.—Defining express delivery and collection limits for Three Rivers, Que.

16859. June 24.—Approving G.T.R. plans for new station at Richmond, Que.

16860. June 2.—Approving C.P.R. plan of employees' passageway from Arlington St. bridge, Winnipeg.

16861. June 25.—Authorizing Canadian Northern Ry. to cross with its Alaskan Southeasterly line 20 highways in Saskatchewan.

16862. June 24.—Ordering C.P.R. from May 1 to Oct. 1, to stop its mail trains at Lesage, Que., on flag.

16863, 16864. June 25, 24.—Authorizing C.P.R. to rebuild six bridges on its Manitoba, Ontario, Atlantic and Eastern Divisions.

16865. June 24.—Authorizing C.N. Ontario Ry. to cross Carp River, Fitzroy tp.

16866, 16867. June 25.—Authorizing C.P.R. to build bridges 104.9 Moose Jaw subdivision, and 0.55, Smiths Falls subdivision.

16868. June 25.—Authorizing Esquimalt and Nanaimo Ry. to open for traffic its Cowichan Lake branch from junction with main line to Cowichan Lake, 18 2-3 miles.

16869. June 25.—Authorizing C.P.R. to open for traffic its Swift Current Northwesterly branch from mileage 33 to 34.8, Sask.

16870. June 25.—Approving location of Campbellford, Lake Ontario and Western Ry. (C.P.R.) from mileage 106.17 from Glen Tay to mileage 121 and rescinding order 16669 May 30, which approved from mileage 106.7 to 123.

16871. June 26.—Relieving C.P.R. from further protection of crossing at mileage 84½ near Plaisance station, Que.

16872. June 26.—Authorizing Georgian Bay and Seaboard Ry. (C.P.R.) to open for traffic its line from Coldwater, mileage 12 to Bethany, mileage 88.2.

16873, 16874. June 26.—Relieving C.P.R. from erecting fences on its Boundary, Nakusp and Slocan, Lardo, Okanagan, Shuswap, Mountain and Arrow Lake subdivisions, B.C.

16875. June 25.—Authorizing C.P.R. to build spur for Alberta Clay Products Co., at Dunmore, Alta.

16876, 16877. June 25.—Authorizing C.P.R. to build ballast pit spur across highway near Elcan, Alta., and its Pheasant Hills branch across highway at mileage 17.3, McAuley subdivision.

16878. June 25.—Relieving C.P.R. from further protecting crossing at mileage 90.5 from Schwitzer Jct., Man.

16879. June 26.—Approving location of C.P.R. station at North Transcona, Man.

16880. June 26.—Extending to July 31, time for installing derrails by G.T.R. on Union Stock Yards branch, Toronto.

16881, 16882. June 26.—Authorizing G.T.R. to build spurs for Dominion Cannery, Ltd., near Forest station, and for N. J. and W. G. Smart, near Collingwood, Ont.

16883. June 25.—Approving changes in G.T.R. side track and stockpen, Priceville, Que.

16884. June 26.—Authorizing G.T.R. to build spur for Benson and Bray, Midland, Ont.

16885. June 26.—Dismissing application of residents of Druid, Alta., to compel G.T. Pacific Ry. to erect station near C.P.R. station. Application may be made for transfer track.

16886. June 24.—Authorizing G.T. Pacific Ry. to cross highway at mileage 176.9 Caslar District, B.C.

16887. June 26.—Authorizing C.N. Ontario Ry. to cross public road at Cote St. Michel, Que.

16888, 16889, June 25, 26.—Approving revised location of C.N. Ontario Ry. industrial branch from Oshawa station to Oshawa, and authorizing it to cross side road in Mara tp.

16890. June 26.—Approving revised location of Toronto Eastern Ry. in Pickering tp., Ont.

16891. June 25.—Amending order 15727, Dec. 19, 1911, re G.T. Pacific Ry. station at Hazleton, B.C., reserving leave to company to apply for approval of site giving adequate facilities.

16892. June 27.—Amending order 16790, June 10, re change in C.P.R. tracks and alteration of bridges on Mountain, Aqueduct, and Guy Sts. Montreal, by substituting city of Montreal for Montreal Tramways Co., in line 8 of operative part.

16893. June 26.—Ordering Dominion Atlantic Ry. to show cause within 10 days why it should not furnish adequate facilities for housing and repairing its engines and cars at Kentville, N.S., under penalty of \$25 a day.

16894. June 26.—Authorizing county of Compton municipality, Que., to build highway crossing over Maine Central Rd.

16895. June 25.—Authorizing J. B. Damp-house, Stony Point, Ont., to build farm crossing over G.T.R.

16896. June 24.—Defining express delivery and collection limits for Montreal.

16897. June 26.—Approving revised location of G.T.R. track in Cobourg, Ont., on

lands of W. J. Crossen and J. G. Field's estate.

16898. June 27.—Authorizing C.P.R. to build spur for N.K. Fairbank, Co., Lasalle, Que.

16899. June 28.—Authorizing South Ontario Pacific Ry. (C.P.R.) to open for traffic its line from Guelph Jct., to Hamilton, mileage 0 to 16.3.

16900. June 27.—General order re matter of indicating changes in freight, passenger and express tariffs. This is given in full on another page.

16901. June 28.—Authorizing G.A.R. to build spur for Congregation of Grey Nuns, St. Laurent parish, Que.

16902. June 27.—Approving proposed change in G.T.R. siding track on Charles St., Berlin, Ont.

16903. June 27.—Authorizing G.T.R. to build spur for A. E. Rogerson, Toronto.

16904. June 26.—Authorizing C.N. Ontario Ry. to build across public road in Ross tp.

16905. June 28.—Approving Canadian Northern Branch Lines Co. location through tps. 30-34, r. 4, w. 2 m., Sask.

16906. June 28.—Approving revised location of Kettle Valley Ry. from station 0 to 53-07.6, west of Penticton, B.C.

16907. June 27.—Approving clearances of Canada Malting Co.'s grain unloading shed on C.P.R. and Great Northern Ry. at Winnipeg.

16908. June 26.—Authorizing Vancouver, Victoria and Eastern Ry. to build highway crossing for B.C. government at Ashnola siding, B.C.

16909. June 26.—Authorizing Esquimalt and Nanaimo Ry. to build highway crossing between 2nd and 3rd Sts., Duncans, B.C., at expense of city.

16910. June 28.—Authorizing city of Hamilton, Ont., to build subway under G.T.R. at Birch Ave., near Sherman Inlet.

16911, 16912, June 28.—Authorizing Campbellford, Lake Ontario and Western Ry. (C.P.R.) to cross eight highways between mileage 130.78 and 144.00, Hope tp., approving location from mileage 94 to 97 and authorizing it to take G.T.R. lands.

16913. June 27.—Authorizing Alberta Ry. and Irrigation Co., (C.P.R.) to cross 39 highways and approving location of Stirling branch from mileage 0 to 37.14, Alta.

16914. June 28.—Rescinding order 3049, May 2, 1907, re C.P.R. bridges over Assiniboine river, at St. James and Headingley, Man.; bridges to be opened for navigation on four hours notice to District Superintendent.

16915. June 28.—Authorizing C.P.R. to use six bridges on its Sault subdivision and Timiskaming branch, Lake Superior Division.

16916. June 27.—Amending order 16686, June 7, re spur for F. H. Willey, Winnipeg.

16917. June 28.—Authorizing C.P.R. to build spur for E. Steel, west Hawkesbury, tp., Ont.

16918. June 27.—Authorizing C.P.R. to open for traffic its second track from Moose Jaw mileage 0.6 to Caron, mileage 16.2, Sask.

16919. June 28.—Authorizing C.P.R. to build spur for Canada Lumber Co., Weston, Ont.

16920, 16921. June 26.—Authorizing Georgian Bay and Seaboard Ry. (C.P.R.) and G.T.R. to operate over crossing at mileage 50.5 from Port McNicoll; and G.B. & S.R. (C.P.R.), and James Bay Ry. (C.N.R.), over crossing at Brechin, Ont., on account of interlocker being completed.

16922. June 28.—Temporarily approving G. T. Pacific Ry. C.R.C. 10, Standard Freight Mileage Tariff to supersede C.R.C. 7.

16923. July 2.—Authorizing Algoma Central and Hudson Bay Ry. to open for traffic its line between mileage 85 and 93, north of Sault Ste. Marie, Ont.

16924. July 2.—Authorizing Canadian Copper Co., and Algoma Eastern Ry. to operate over crossing in McKim, tp., half-interlocker being completed.

16925. July 2.—Authorizing C.N. Pacific Ry. and C.P.R. to operate over crossing on C.P.R. Mission Branch, B.C., interlocker being completed.

16926. July 2.—Approving Canadian Northern Ry. location through tps. 24-22, r. 1, w. 5 m., and r. 29, w. 4 m., Alta., mileage 0 to 13.21.

16927. June 29.—Authorizing Campbellford, Lake Ontario and Western Ry. (C.P.R.), to cross four highways and divert highways between mileage 165.46 and 165.96, Ont.

16928. July 2.—Authorizing C.P.R. to build additional track across Queen St. Port Moody, B.C.

16929. July 2.—Authorizing C.P.R. to build its Moose Jaw southwesterly branch across highway at mileage 29.75.

16930. June 29.—Authorizing G.T. Pacific Ry. to build spur to Union Stock Yards, St. Boniface, Man., crossing of Canadian Northern Ry. to be protected by interlocker.

16931. July 5.—Extending to Aug. 1, time for putting into effect order 16479, May 10, re classification of gramophones, etc.

16932. July 4.—Authorizing C.P.R. to open for traffic its Moosejaw Southwesterly

branch, from mileage 27.4 to 35; trains limited to 15 miles an hour.

16933 to 16935. June 29.—Authorizing Edmonton, Dunvegan and British Columbia Ry. to cross five highways in Alberta; and approving its revised location through tp 55, r. 25, w. 4 m., and authorizing it to cross highway between secs. 33 and 34.

16936. June 28.—Ordering G.T.R. to install improved type of electric bell at two crossings in Corinth, Ont., 20% to be paid from railway grade crossing fund.

16937. June 29.—Approving Kettle Valley Ry. location, from Penticton to Coldwater, B.C., (sec. A).

16938. July 6.—Approving Alberta Interurban Ry. location through sec. 13, tp. 24, r. 1, w. 5 m., mileage 1.25 to 2.28, Calgary, Alta.

16939. July 4.—Ordering that Vancouver, Fraser Valley and Southern Ry. (B.C.E.R.), be subject to penalty of \$25 a day after July 10, it shall be in default of requirements of order 16225, Apr. 3, re filing tariffs.

16940, 16941. June 29, July 2.—Authorizing C.N. Ontario Ry. to cross two public roads in Westmeath tp.,

16942. June 29.—Amending order 16653, May 31, re building of subway under G.T.R. at Sherman Inlet, by City of Hamilton, Ont.

16943. June 27.—Approving changes in G.T.R. bridges over public road in Tay, tp., Ont.

16944, 16945. July 3.—Authorizing G.T.R. to build spurs for Meaford Brick Co., con 1, St. Vincent tp., Ont., and Alabastine Hard-mortar Co., Toronto.

16946, 16947. July 5.—Approving G.T.R. plans for bridges 189 and 77 on its Northern and Ottawa Divisions; and three and two bridges on its 12th and 15th districts.

16948, 16949. June 29.—Authorizing Campbellford, Lake Ontario and Western Ry. (C.P.R.), to build across two highways in Newcastle, and Hope tp., Ont.

16950, 16951. July 5, 4.—Authorizing C.P.R. to rebuild two bridges on its Wingham and Emerson subdivisions, and to build two bridges on Campbellford, Lake Ontario and Western Ry., mileage 180.57 and 0.91, Ont.

16952 to 16954. July 4, June 6.3.—Extending to July 31, time for completion of electric bells by C.P.R. at Coldwater Jct., Ont., as required by order 15950, Feb. 8; to Aug. 31 for building spur at Wolverton, Ont., required by order 16287, Apr. 11; and to Dec. 31, for completion of spur at Emerson, Man., required by order 13302, Mar. 23, 1911.

16955. May 31.—Relieving C.P.R. from erecting fences on portions of its Eastern and Lake Superior Divisions.

16956 to 16960. July 5.—Authorizing C.P.R. to build spurs for Canada Cement Co., under lease to Revelstoke Saw Mill Co., Calgary Jct. Alta.; O. Lemire, St. Henri de Mascouche parish, Que.; G. Pigott & Co., York tp. Ont.; Ogilvie Flour Mills Co., Medicine Hat, Alta., and G. P. Sherwood & Co., Montreal.

16961. July 4.—Authorizing C.P.R. to appropriate land for Windsor St. terminals, Montreal.

16962. July 3.—Ordering G.T.R. to build farm crossing for E. N. Richards and G. H. Bennet, Windsor, Ont., on farm lot 102, con. 1, Sandwich East tp., Ont.

16963. July 5.—Relieving G.T.R. from further protecting crossing just east of milepost 8, near Transcona, Man.

16964. July 10.—Extending to Jan. 1, 1913, time for completion of spur by Esquimalt and Nanaimo Ry., authorized by order 15626, Dec. 14, 1911.

16965. July 5.—Relieving C.P.R. from further protecting crossing just west of mileage 123, Portal subdivision, Sask.

Samuel Price, K.C., of St. Thomas, Ont. is reported to have been appointed to revise and consolidate the Dominion Railway Act.

The National Steel Car Co., Ltd., has been incorporated under the Dominion Companies Act with an authorized capital of \$6,000,000, consisting of \$3,000,000 of 7% cumulative preferred shares and \$3,000,000 ordinary shares. It is stated that the present issue of \$1,500,000 preference shares and \$2,000,000 of ordinary shares have been subscribed. The head office will be in Montreal, and the works at Hamilton, Ont., the directors being Sir John Gibson, W. Southam, and J. J. Scott, of Hamilton; Sir Henry M. Pellatt, Toronto; W. G. Ross, C. H. Cahan, M. Davis, and B. Magor, Montreal; W. B. Parsons, W. K. Brice, and M. H. Coggeshall, New York City. The company will be under the management of Basil Magor, at one time in the service of the Dominion Car and Foundry Co., of Montreal, and latterly connected with the Magor Car Co., of Passaic, N.J.

Canadian Northern Railway's Perpetual Consolidated Debenture Stock Issue.

The C.N.R. Co. issued a prospectus in London, Eng., recently of \$1,438,356 (\$7,000,000) 4% perpetual consolidated debenture stock at 95.

The trust deed provides that the total amount of debenture stock shall not exceed £2,000 a mile of line operated, and an amount not exceeding the cost price of securities of independent corporations deposited with the trustees. The debenture stock is secured by a general charge upon the undertaking, property and assets (other than land and money subsidies) of the company, subject to \$1,180,600 of bonds primarily charged on the Ontario Division (287 miles), and to charges created, or to be created, not exceeding \$10,000 a mile of line (other than the above mentioned 287 miles of line in Ontario) or \$15,000 per mile if guaranteed by the Dominion Parliament, or any of the provinces, and is a specific first mortgage upon certain securities deposited with the trustees.

The proceeds of the present issue are required in anticipation of a great increase in business on the opening of the through transcontinental service, for the initial acquisition, construction or extension and equipment by the Canadian Northern System Terminals Ltd., of certain terminal and hotel facilities at important central points on the system including Quebec, Montreal, Ottawa, Toronto, Hamilton, Sudbury, Port Arthur, Winnipeg, Brandon, Regina, and Calgary. These terminal and hotel properties are, or as acquired will be, vested in the C. N. System Terminals, Ltd., but will be used by the C.N.R. under permanent lease or agreement. The C. N. System Terminals, Ltd., has created first mortgage securities to the extent of \$7,000,000, which it has sold to the C.N.R. Co., and which have been deposited with the trustees for the debenture stock. The present issue of debenture stock is being made against these securities. It is expected that through trains will be running from Quebec to Vancouver early in the spring of 1914.

The C.N.R. is operating 4,100 miles, which include 644 miles of leased lines. In addition, about 500 miles of new branch lines have been completed and will shortly be opened for traffic, and over 500 miles more are under construction, a large proportion of which will be completed this year.

The Quebec Bridge Construction.

The principal work in progress on the site of the bridge across the St. Lawrence River near Quebec, is the sinking of the caisson for the south main pier. The dimensions of the caisson are 55 by 180 ft. by 40 ft. in height. It has been sunk to a depth of 21 ft. under ordinary high-water, and 4 ft. in the river bed under ordinary low water. It is expected that the caisson will have to be sunk to a depth of about 70 ft. before an absolutely safe foundation for the pier will have been reached. Three hundred men have been employed in three shifts under a five pound air pressure in the caisson. But as the depth increases, the number of men employed will be increased, and the period of working in the caisson will be shortened. There are in addition, about 300 men employed outside the caisson. It is expected that the caisson will be sunk to a proper depth and the pier erected by the fall. The masonry work on the other piers is being progressed with and it is expected to have everything completed by the fall, for the erection of the superstructure. The contractors for the substructure are M. P. and J. T. Davis, Quebec. (Sept., 1911, pg. 831.)

RAILWAY DEVELOPMENT.

Projected Lines, Surveys, Construction, Betterments, Etc.

Alberta Interurban Ry.—The Board of Railway Commissioners has approved of location plans for the line from mileage 1.25 to 2.28 in Calgary, Alta. An arrangement has been made whereby the company's Carbon line will enter Calgary over the G.T. Pacific Ry. tracks, to the station ground at the R.N.W.M.P. barracks, and thence proceed over the city's electric railway tracks to the market place. This arrangement, so far as the city is concerned, was approved by the city council, July 8. A site for shops has been leased by the city at a nominal rental, the work of reclamation to be done by the company.

The Minister of Railways has approved revised route map for the company's projected Carbon line.

Alberta, Peace River and Eastern Ry.—Application is being made to the Minister of Railways for approval of the route map of this projected line from Milk River, Alta., to Peace River and on to Fort Churchill, Hudson Bay. The application was opposed June 26, by other companies, and the Minister stated that he would investigate the matter during his trip to the West. (July, pg. 339.)

Algoma Central and Hudson Bay Ry.—Track laying was completed July 3, on the extension to the C.P.R. transcontinental line, the steel laying gangs connecting the last rails at mileage 109.75 north of Sault Ste. Marie, Ont. The point of connection is at Franz, 23 miles west of Missanabie station on the C.P.R. From this point the line is under construction to Hearst, on the National Transcontinental Ry. We are officially advised that ballasting on the extension is being proceeded with between mileage 93 and 195 at Franz, three steam shovels being at work. It is expected to have the section from Hawk Jct. and Franz, mileage 164.25 and mileage 195, completed ready to turn over to the operating department early in August. This will enable the operation of a regular train service between Michipicoten and the C.P.R.. It is expected that the ballasting on the line from mileage 93 to Hawk Lake Jct., will be completed by the end of October.

The work at the company's terminals at Sault Ste. Marie is, we are advised, proceeding satisfactorily. The station which is estimated to cost \$100,000 and the yards and shop, which are estimated to cost \$300,000, are well advanced, and their completion is looked for by winter. The company's steam shovel has been used on the yard excavation work, and it is intended to move it out to a ballast pit, in order to get out material for adding considerable ballast on the line between mileage 20 and 68, in order to bring it into first class shape. R. S. McCormick, Sault Ste. Marie, Ont., is Chief Engineer.

The Board of Railway Commissioners has authorized the opening for traffic of the extension from mileage 85 to 93 north of Sault Ste. Marie. On July 5, President Drummond, of the Lake Superior Corporation, owning the line, and other officers made a trip of inspection over the entire line to Franz and subsequently went over the extension under construction to Hearst. (June, pg. 299.)

Algoma Eastern Ry.—Grading on the extension of the line from the end of the present operated line at Crean Hill, Ont., to the terminal site on Goat Island, directly across the channel from Little Current, Manitoulin Island, has been completed, and 28.5 miles of track have been laid. The total distance from Crean Hill to Goat Island is 62 miles. Track laying has been delayed owing to lack of steel, but deliveries have now been made at Espanola and the work resumed. It is expected to have the 7.5 miles east to Crean Hill, and the six miles from Es-

panola to West River laid about Aug. 1. At this point track laying will be suspended for about a month, pending the erection of a combined timber and steel plate girder bridge. It is expected to complete tracklaying to the terminal yard site on Goat Island, as well as the ballasting from Crean Hill about the end of October.

Work on the terminal site at Little Current, and the construction of a bridge across the channel will be proceeded with this summer. There has been some delay in reference to the bridge on account of the requirements of the Public Works Department in regard to the width of the opening. This has now been adjusted and it is intended to put in a swing draw span on a centre pier in the channel, giving 150 ft. clear opening on each side. The balance of the structure, which will be about 600 ft. long, will consist of deck plate girders on concrete piers with end wing abutments. R. S. McCormick, Sault Ste. Marie, Ont., is Chief Engineer. (May, pg. 238.)

Atlantic, Quebec and Western Ry.—We were officially advised, July 5, that the whole of the line to Gaspé Basin, Que., had been completed and that it was expected to open it for traffic before the end of July. (July, pg. 339.)

Bruce Mines and Algoma Ry.—We have been officially advised that arrangements are being made for the company's financing, and that until these are completed nothing can be said as to the plans for future construction. (May, pg. 238.)

Central Ry. of Canada.—We are officially advised that the contractors have got well started on the first section of this line, and expect to have the grading completed early in September. This section extends from McAlpine, on the C.P.R., to Lemieux, Ont., 25 miles. The general contractors, C. J. Willis and Sons, London, Eng., and Montreal, have sublet several short lengths of grading to farmers in the district. F. S. Williamson, Montreal, is Chief Engineer. (July, pg. 339.)

Chicago, Milwaukee and St. Paul Ry.—Chicago, Milwaukee and Puget Sound Ry.—The latter line, which is an extension of, and controlled by, the first named was opened for traffic to Bellingham, Wash., July 11.

E. W. McKenna, Vice President, C.M., and St. P. Ry., is quoted as stating in reference to the reports referred to in our last issue, that the company had no intention whatever of entering Winnipeg, or invading Canadian territory, for some time to come, if at all. The company had not secured options for any right of way, nor had any surveys for such a line been completed.

Surveys are being made for a line from the C.M. and P.S. Ry. through Kalispell, Stillwell and the Tobacco valley, to Roosville, Mont., or Phillips Pass, to which point, the C.P.R. is reported to have made surveys for a line from Elko, B.C. (July, pg. 339, and June, pg. 299.)

Cumberland Ry. and Coal Co.—The Dominion Coal Co., which owns this line, is said to want to build a line from Springhill to Wallace, N.S., on Northumberland Strait, where it is proposed to establish a shipping point for its collieries. Hitherto the company has shipped its coal to Parrsboro, on the Bay of Fundy. J. H. Plummer, President, D.C. Co., had an interview with the Minister of Railways recently with a view of obtaining a subsidy for construction. Another report says that the line will be built as an Intercolonial Ry. branch. (June, pg. 21.)

Dominion Atlantic Ry.—A contract has been entered into between the company and the Dominion Government under the act granting aid to certain railways for

the building of an extension of the company's line in Canning, N.S., to the government wharf there, one mile, (June, pg. 299.)

Edmonton, Dunvegan and British Columbia Ry.—The Board of Railway Commissioners has approved of location plans for the line from mileage 4 to 14, Alta.

Work is reported to have been started on laying out the terminals at Edmonton. A connection has been made with the G.T. Pacific Ry. yards, and several sidings laid, in order to provide for the handling of construction material. (July, pg. 339.)

Essex Terminal Ry.—The Board of Railway Commissioners has authorized the opening for traffic of the extension of the line through Windsor, Sandwich tp., and Sandwich, Ont. (Jan., pg. 22.)

Fredericton and Grand Lake Coal and Ry. Co.—We are officially advised that the profile plans show a line following the east bank of the St. John River from Gibson, N.B., for about seven miles, through an open, well-cultivated district; thence to the Little River, about the 20th mile, is through a wooded country, which has been lumbered over for many years; and from the Little River to within two miles of Minto, the line will pass through a well farmed district. Near Minto, where connection is made with the New Brunswick Coal and Ry. Co., is the coal area, which is to be tapped. The maximum gradient is 1% compensated for curvature and the maximum curvature is six degrees. The substructures of the bridges over the Nashwaak River, Noonan Creek, Burpee Mill stream and Little River are all of concrete. All culvert openings under embankments sufficiently high are to be concrete arch culverts, varying from 4 ft. to 10 ft. openings, and the smaller culverts are to be of corrugated galvanized iron pipe. H. W. D. Armstrong, Fredericton, N.B., is Chief Engineer. (July, pg. 339.)

We have been officially advised, that the projected branch line to Marysville, was being located.

A contract has been entered into between the company and the Dominion Government under the act granting aid to certain railways for the building of a line from the Intercolonial Ry. at Gibson, to Minto, with a branch line to Marysville, a total length of 35 miles.

Glengarry and Stormont Ry.—Press reports state that engineers have started making a survey for a line from near St. Polycarpe, southerly and westerly through Glengarry county to Cornwall, Ont. C. L. Harvey, C.E., is a provisional director of the company. (June, pg. 300.)

The survey party is in charge of H. S. Dickson, with M. J. McLennan as assistant, and is working between Cornwall and Williamstown. (June, pg. 300.)

Hudson Bay and Pacific Ry.—An order of the High Court of Justice, London Eng., has been granted directing the winding up of the H.B. and P. Ry. Development Co., which was started for the purpose of financing the construction of the line. A meeting of creditors is to be held in London, Eng., Aug. 7.

Intercolonial Ry.—Tenders are under consideration for the erection of a brick and stone passenger station at St. Flavie, Que.; a 10-stall locomotive house and annex with brick chimney, etc., at Point Tupper, N.S., and for the erection of an extension to pier 7, Richmond, N.S.

An Ottawa press dispatch says: "The government has decided to promote the shipment of coal from the Springhill, N.S., mines to the upper provinces by the construction of a spur line of the I.R.C. from Springhill to Wallace. The harbor at Wallace will be dredged and docks constructed for the handling of the coal. Financial provision for this will be made at the next session of Parliament." Another report says the line will be built by the Cumberland Ry. and Coal Co. (See under that heading.)

Joliette and Lake Manuan Colonization Ry.—A contract has been entered into between the company and the Dominion Government under the act granting aid to certain railways for the building of a line from Joliette, to or near Lake Manuan, Que., 60 miles. (June, pg. 284, and May, pg. 230.)

Kettle Valley Lines.—The Board of Railway Commissioners has approved location plans of the extension of the line from Penticton to Coldwater, B.C., plan of a 250 ft. deck span over Trout Creek near Penticton, and revised location plans of the line from mileage 0 to 53.07 west of Penticton.

An arrangement is reported to have been completed under which the K.V. Ry. and the C.P.R. are to have joint terminals in Grand Forks, B.C. The city council has granted a free right of way for additional trackage, and exemption from taxation for 10 years, and the companies undertake an initial expenditure of \$200,000. The necessary bylaw to authorize the council to enter into the agreement is to be voted on at an early date. (July, pg. 339.)

London, Lake Erie and Tillsonburg Ry.—Press reports state that J. H. Teall, Tillsonburg, Ont., who controls this charter, has sold out all his interests, together with the property he has acquired at Port Burwell in connection with it, to the G.T.R.

Michigan Central Rd.—A contract is reported to have been let to G. A. Ponsford, St. Thomas, for the erection of an engine dispatching house 100 by 50 ft., and an oilhouse 40 by 50 ft. at St. Thomas, Ont. (June, pg. 301.)

Minneapolis, St. Louis and Canadian Rd.—A company with this title is reported to have been incorporated at Minneapolis, Minn., July 15 to build a line from Watertown, S.D., to the Canadian boundary. Watertown is a central point on the Minneapolis and St. Louis Rd., between St. Louis, Minn., and Le Beau, S.D. N. Erb, of the M. and St. L. Rd., is actively promoting the new company. (Jan., pg. 22.)

Minneapolis, St. Paul and Sault Ste. Marie Ry.—The Central Terminal Co., a subsidiary organization, has finally secured possession of properties bounded by Twelfth Place, West 15th St., South Canal St., and South Clinton St., Chicago, Ill., as a site for its terminals. The new terminals are estimated to cost \$5,000,000. The work of demolishing the buildings has been in progress for some time, and will now have been completed, as the arbitration proceedings in connection with none of the properties have been closed. (June, pg. 301.)

Montreal Central Terminal Co.—A special meeting of shareholders is to be held in Montreal, Aug. 9, to elect directors, increase the capital stock, authorize an issue of bonds, and the making of traffic agreements with all railway companies requiring terminal facilities in or about Montreal. F. E. Came, 44 Beaver Hall Hill, is secretary. (May, pg. 239.)

North Ry.—We are officially advised that J. T. E. Lavoie is in charge of the party in making a preliminary survey for the line from the mouth of the Nottaway River on Hudson Bay, to Lake Matagami, Que.

The organization of the company is reported to be about completed and the financial arrangements well forward. Surveys are reported completed for 120 miles north from the crossing of the National Transcontinental Ry., in addition to the surveys from Montreal to that point, and it is said that it is expected to start construction next spring. (July, pg. 339.)

Northern Territorial Ry.—An office has been opened in Edmonton, Alta., by H. G. N. Neville, who is stated to be the Chief Engineer for this railway, and an unconfirmed press report states that in the very near future 40 survey parties are to

be put in the field, and in all some 800 men will be engaged on preliminary survey of the line from Edmonton to Hudson Bay. The report goes on to say:—"Next season grading of the road to the northeast and the laying of steel will be carried on, and in two years time, according to plans of the company, the line will be complete and in operation from Edmonton to Lake Athabasca. The company will then proceed with the construction of the line easterly to the north shore of Lake Wellaston in Saskatchewan and thence to Fort Churchill or Port Nelson, named as alternative ports under a federal charter. From Edmonton a cut off is to be constructed at a later date, giving connection with Hudson Bay by a still shorter route. From Lake Athabasca the road will run westerly north of the Peace River block, from Hudson Bay terminal. The railway will run steamships to a British port." (May, pg. 239.)

Northern New Brunswick and Seaboard Ry.—We are officially advised that of the mileage subsidized last session of the Dominion Parliament, 16.7 miles, from the Drummond mines at Austin Brook, to the Intercolonial Ry., near Bathurst, N.B., have been built, and that surveys have been completed for the remaining 9.3 miles, to deep water in Bathurst Harbor. This latter mileage, we are advised, will not be built for some time. (May, pg. 239.)

Pacific and Hudson Bay Ry.—We have been officially advised that the company has not yet been formally organized. It has power to build a line from the Pacific coast to Hudson Bay, about 1,500 miles, the first section being from Bella Coola, B.C., to Dunvegan, Alta. Three survey parties are in the field, and it is hoped to have the route on the first 700 miles surveyed by the end of the summer. The route map for the line from Kimisquit, near Bella Coola, to Natalus Lake, B.C., about 110 miles, has been approved by the Minister of Railways, but application will shortly be made for the approval of a revised route. It is expected that the organization of the company will shortly be completed and arrangements made for starting construction early in 1915. H. D. Verschoyle, General Manager, Port of Bella Coola, Ltd., Vancouver, B.C., is interested. (June, pg. 301.)

Pacific Great Eastern Ry.—D'Arcy Tate, Vice President and General Counsel, is reported to have stated on his return to Victoria, B.C., from England, recently, that arrangements had been completed for a first issue of \$5,000,000 of the company's bonds, guaranteed by the province of British Columbia, and that it was expected construction would be started near the head of Howe Sound at an early date. P. Welch, Vice President, is quoted as stating, July 4, that it was expected to break ground at some point between North Vancouver and Howe Sound, within a month, and to crowd the work so as to have the line ready for traffic within two years. J. Callaghan, Vancouver, is Chief Engineer. (July, pg. 339.)

Quebec and Saguenay Ry.—It is expected, we are officially advised, to have the section of the line under construction completed to subgrade about Aug. 31. It is intended to start tracklaying simultaneously, from Cap Tourmente and from Ste. Irene, Que. The latter is about six miles from Point au Pic, near Murray Bay, and is more convenient for the landing of rails. About ten miles west of Ste. Irene the company has opened a ballast pit, from which ballast will be used for the eastern division from Baie St. Paul to La Chute, above Murray Bay. If the fall weather is favorable, it is expected to have the first lift of ballast completed so that the line will be opened for traffic in December.

The question of the proposed extension to Chicoutimi, we are advised, is for the present in abeyance. A. H. N. Bruce, Quebec, is Chief Engineer.

Representatives of the European financiers associated with Sir Rodolphe Forget, in the construction of this line, were in Montreal, July 7. Sir Rodolphe advocates the extension of the line to Cape St. Charles, and the establishment there of a port for trans-Atlantic passenger steamers. (July, pg. 340.)

Quebec Eastern Ry.—We are officially advised that surveys for this projected line from the southern approach to the Quebec Bridge, to Sherbrooke, Que., have been completed, and that it is expected to start construction in the near future. A. H. N. Bruce, Quebec, is Chief Engineer. (June, pg. 301.)

Reid Newfoundland Ry.—At its recent session the Newfoundland Legislature authorized the government to raise a further amount of \$1,000,000 in order to complete the branch lines authorized to be built in 1910, for which purpose \$4,000,000 have already been expended. (May, pg. 240.)

The Southampton Ry. Co. has entered into a contract with the Dominion Government under the act granting aid to certain railways for the building of a line from Millville, on the C.P.R., St. John-Edmundston line, to the St. John River, near the Pokiok bridge, N.B. (June, pg. 302.)

Timiskaming and Northern Ontario Ry.—The T. and N.O. Commission is reported to have arranged with Jas. McMillan to make a survey of the country in the vicinity of Moose River, on Hudson Bay, with a view of locating a railway terminal there, and of developing a port for deep sea traffic. (July, pg. 340.)

White Pass and Yukon Route.—The Board of Railway Commissioners has authorized the British Yukon Ry. to open for traffic its branch from mile post 106 to Pueblo Mine, Yukon, 13 miles. (Aug., 1911, pg. 7571.)

President Dickeson is reported to have stated, prior to leaving Dawson, Yukon, July 15, that the company had an engineer locating an extension of the line from White Horse to Yuyon Crossing, 120 miles. Such a line would tap the Tantalus coal fields.

Retirement of J. J. Hill.—In a letter addressed to the stockholders of the Great Northern Ry., (U.S.A.), July 6, J. J. Hill says: "With my resignation today of the chairmanship of the board ends my active official participation in conduct of the G.N.R. The work begun nearly 40 years ago has been substantially accomplished; though its results have been extended far beyond the foresight of anyone at that time. The property whose fortunes I have directed for so many years has become an organic growth. Its future will be shaped more by the forces that govern development of the natural resources of the country than by individual initiative. I will remain a member of the executive committee, and any service it may need from me will always be at its command. But it seems wise to begin the process of adjustment to other hands at this time, when all the outlook is fair and every change may be weighed with deliberation in the light of what is for the best interest of the property."

The American Association of Railway Accounting Officers' annual convention was held at Quebec, June 26 to 28. During the meetings, the members were at various times the guests of the Quebec Ry. Light and Power Co., C.P.R., Quebec and Lake St. John Ry., Intercolonial Ry. and the Richelieu and Ontario Navigation Co. The officers for the current year are, President, M. P. Beauvelt, I.C.R., Chicago, Ill.; Vice Presidents, C. M. Beuling, Pennsylvania Rd., Philadelphia, Pa., and C. B. Segar, Union Pacific Rd., New York. J. Leslie, Assistant Comptroller, C.P.R., Montreal, was elected on the executive committee.

Grand Trunk Pacific Railway Construction.

Collingwood Schreiber, Dominion Government Consulting Engineer, started from Winnipeg, July 15, on his annual trip of inspection over the completed line of the G.T.P.R. and of the section of the main line, and the branch lines under construction. He went by rail to the end of track, and then proceeded along the right of way from Tete Jaune Cache by whatever mode of transport offered, to Van Arsdol, where the train service is available to Prince Rupert.

E. J. Chamberlin, President, returned to Montreal, July 15, after a trip to Winnipeg and some other points in the West. He said that while there was a shortage of labor the work through to the coast was being pushed forward. It was, however, questionable whether the line could be finished earlier than the end of 1914.

M. Donaldson, Vice President and General Manager, in an interview July 9, said the Mountain Division had been completed to the Fraser River, beyond Tete Jaune Cache, and supplies and material were being sent ahead by steamboats. This would greatly expedite construction, as heretofore all supplies for work had to be taken in over the tote road.

The Board of Railway Commissioners has authorized the opening of the line for traffic from Hinton, mileage 978 to Fitzhugh, mileage 1028. Beyond this point the contractors are operating construction trains, as far as Tete Jaune Cache, at mileage 1097.

From the western end of the line track has been laid to the Skeena River, the bridge across which was expected to be completed July 30. This bridge has a total length of 943 ft. 10 ins. between parapet walls, and consists of three 70 ft. deck plate girder spans, and three 240 ft. deck truss spans, resting on masonry. The base of rail is 112 ft. above high water level, 140 ft. above low water level, and 163 ft. to bottom of river. The main feature of the bridge is the two river piers which, owing to the depth of the water, had to be built with pneumatic caissons. These caissons were 41 by 89 ft., divided longitudinally into two working chambers. They were sunk to a depth of 177 ft. from base of rail, which gives a height for the concrete piers from foundations to seat of bridge of about 134 ft. Owing to the rapidity and depth of water at that place the 240 ft. truss span over the channel was erected without falsework.

From the eastern bank of the river, construction gangs are at work towards Fort George. The heaviest portion of the work is at Burns Lake, but it is not expected that this will be taken in hand until Jan., 1913, as it will not be possible to get the steam shovels and other plant in until track is laid.

At the terminals at Prince Rupert, Foley, Welch and Stewart have taken over the excavation contract let to Rich and Harris, and have sublet part of the work to A. McDougal and A. Rankin.

G.T.P.R. BRANCH LINES.

The Premier of Saskatchewan is reported to have informed President Chamberlin that the Provincial Government is prepared to make provision for the guaranteeing of bonds to provide adequate terminal accommodations for the company's lines at Saskatoon, Moose Jaw, and Swift Current, as well as for the completion of the terminals at Regina. Mr. Chamberlin is reported to have informed the Premier, June 27, that plans were being prepared to have the work at these places gone on with at once.

The question of the route by which the company's branch from Regina will enter Moose Jaw, Sask., is said to have been settled. The route, it is said, will be through the coulee north of the city, and the Crescent site selected by the Can-

adian Northern Ry. will be utilized as a joint station.

H. E. Bissell has been securing a right of way for the company's branch line from Yonge, into Prince Albert, Sask., and he is quoted as stating that tracks will be laid by the end of the year.

The Minister of Railways has approved a revised route map for about 11 miles of the Cutknife branch.

Location surveys are being made for the branch from Watrous to Swift Current, and press reports state that construction will be started at an early date.

We are officially advised that, while surveys have been made for a line from Watrous to Swift Current, Alta., the final location has not been settled, and no decision has been reached as to when construction will be started.

Track laying is being proceeded with on the branch from Biggar to Swalwell, where connection will be made with the branch from Tofield. This latter branch has been in operation for some time to Red Deer, mileage 83.5, and the Board of Railway Commissioners has authorized the running of trains from Red Deer to Trochu, at mileage 121.4. Track is reported to have been laid to Three Hills, about 10 miles north of Swalwell. It is further reported that grading will be completed into Calgary early in Aug., and that track will be laid by the end of the year.

The Minister of Railways has approved route map for the branch from Calgary to Coult's, Alta., of 46 miles. A Lethbridge dispatch, July 17, states that the contract for building this line has been let to J. D. McArthur, Winnipeg.

Track is reported to have been laid on the Albert coal branch, to 33 miles from Bickerdike, Alta., and it is expected to complete the remaining 25 miles this year. (July, pg. 341.)

National Transcontinental Railway Construction.

The Dominion Premier, prior to sailing for England, recently said the Dominion Government fully appreciated the importance of the port of Quebec and the necessity of pushing forward the development of the harbor, and the construction of the terminals for the N.T.R. to a completion as soon as possible.

The contractors for the building of a line, and the laying out of terminals at Cap Rouge, in connection with the Quebec Bridge, M. P. and J. T. Davis, have made considerable progress with their work, and it is expected that it will be sufficiently advanced to permit the operation of trains early in Sept.

Daily papers of July 9, contained an interview with M. J. O'Brien, railway contractor, of Renfrew, Ont., which reported him as stating that at points east of Cochrane, Ont., the contractors were altering the 0.4% gradient, called for by the contracts to something steeper, and telegrams from Cochrane stated that R. W. Leonard, Commissioner, N.T.R., had decided to increase the gradients from 0.4% westward and 0.6% eastward to 0.8% and in some cases to 1%, with the object of saving upon construction. The Department of Railways gave out an official denial of the report July 15, and the G.T. Pacific Construction Co., which is building one of the sections where the alteration was said to be going on, has also denied the report.

It was reported, July 10, that track had been laid to 156 miles east of Cochrane, and to 206 miles west of Cochrane. Grading is practically completed through to Superior Jct., and it is expected that the building of the bridges and the track-laying will be completed on the line easterly from Winnipeg to Cochrane, by the end of the year.

A station building, roundhouse, etc., has been completed at Hearst, at which

point the Algoma Central and Hudson Bay Ry. will cross on its way to Hudson Bay.

We are officially advised that contracts for the construction of station and other buildings, referred to on pg. 291 of our June issue, have been let as follows: P. Cauchon, Quebec; Thetford Contracting Co., Black Lake, Que.; Moncton Construction Co., Moncton, N.B.; G. Goodwin, Ottawa. The contract for the equipment of mechanical coaling plants at Moncton, Napadogan, Edmundston, N.B.; Grant, Colvert and Armstrong, Ont., has been let to Williams and Wilson, Ltd., Montreal.

An extensive forest fire, June 28, near Superior Jct., is reported to have caused damages to the amount of about \$100,000 to the ties and bridges on the line easterly. Five trestle bridges and thousands of ties waiting shipment are said to have been burned. (July, pg. 341.)

The Will of the Late James Osborne.

The will of the late James Osborne, General Superintendent, British Columbia Division, C.P.R., who died at Vancouver a short time ago, was probated at Toronto, July 16. It disposes of an estate of \$37,897.48. A Ross Osborne, the eldest son, receives the silver tea service presented by Winnipeg wholesale merchants when Mr. Osborne left there for St. John, N.B., some years ago. The balance of the estate is to be administered for the benefit of the widow and children until the youngest child is 21 years of age, when it is to be divided among Mrs. Osborne, the two sons and four daughters in equal shares of \$5,199.64 each. If Mrs. Osborne remarries she is to receive the income of only one half her share.

Following are extracts from the will:—"My desire is to preserve the family tie; that is that all members thereof shall be thoroughly loyal one to the other; that they shall be sober-minded, teetotalers, virtuous, good and truthful, all working together for the good of the family and mankind; that each member of the family shall treat the others like ladies and gentlemen, be kindly affectioned one to another, and be good and generous to their stepmother. I desire that a family home be maintained so long as there is necessity for it, and that the children be loyal to each other and to their stepmother. I should like my eldest son to take his place as the head of the family, and retain it by good conduct and attention to business and to the family, and to him I bequeath the silver tea service presented to me by the wholesale merchants of Winnipeg." It is also requested that the silver service be handed down from eldest son to eldest son, each having his name engraved on the tea kettle, so that it may remain in the family as a remembrance of the original recipient.

Development of the Railway Systems of the World.—The length of the railway lines at the end of 1909 (the latest figures available) are as follows: Europe, 329,691 kilometers; America, 513,824 kilometers; Asia, 99,436 kilometers; Africa, 33,481 kilometers; Australia, 30,316 kilometers, or a total of 1,006,748. The average cost of construction per kilometer of line is \$76,718 for Europe, and \$41,785 in other parts of the world. On this basis the European railways at the end of 1909 would have cost \$25,293,000,000, while the railways in other parts of the globe would have cost \$28,829,100,000.

W. F. Joly and J. P. Heffernan were each fined \$25 and costs, at Winnipeg recently, on a charge of conspiracy to obtain a situation from the C.P.R. by fraud. The former applied for a position of switchman, and being defective in sight and hearing, got the latter to personate him before the medical board when called on for examination.

Great Northern Railway Lines in Canada.

Speaking recently in Victoria, the British Columbia Premier said with reference to the rumors of G.N.R. developments in the province, that he had been informed by L. W. Hill, that the company had decided to proceed with its construction work, and that it is intended to complete the Vancouver, Victoria and Eastern Ry., to extend its lines on Vancouver Island, and to do other work in the province. It was not possible to state definitely what all the plans included, but he was informed that it is intended to let contracts for extensive construction at an early date, and that no time will be lost in going ahead with the work.

Vancouver, Victoria and Eastern Ry. and Navigation Co.—The question of the route of the line through the Hope Mountains, which is a matter of controversy with the Kettle Valley Lines, is in process of solution. An inspection of the route in dispute was made July 26, and following days by J. H. Kennedy, Chief Engineer, V.V. and E.R. and N. Co. A McCulloch, Chief Engineer, K.V.L., and A. J. Kerr, representing the Board of Railway Commissioners. The route in dispute extends from Hope to the Coquihalla summit, 35.5 miles and the cost of construction is placed by Mr. Kennedy at \$3,500,000. It is suggested that the two companies join in the building of a double track route between these points. The matter is to be considered by the Board of Railway Commissioners at its present Western sittings.

The Chief Engineer of the G.N.R. made an inspection recently of the construction in progress, and in an interview stated that ballasting was in progress between Princeton and Coalmount, and that it is expected to have track laid to Tulameen by the fall. Grading is in progress beyond Tulameen.

Vancouver to New Westminster.—Press reports state that it has been arranged to build a second track on the line from Vancouver to New Westminster, B.C., and that the work will be done by the company's own staff.

Victoria and Sidney Ry.—Application is being made under the provisions of the Navigable Waters Protection Act, 1906, for approval of the plan and site of a proposed car barge landing at Sidney, B.C. (July, pg. 361.)

Dominion Government Railway to Hudson Bay.

We are officially advised that the contract for the second section of the Dominion railway to Hudson Bay, which it is about to let, will extend from Thicket Portage, the end of the section now under construction, to Split Lake, 68 miles. The work on this section is considered to be the heaviest on the route. The grading will average about 35,000 cubic yards a mile. The maximum gradient is 0.4% each way, but there is a considerable amount of curvature, mostly of two and three degrees, and there are two or three points where curves of four degrees are required. The principal bridge structure is over the Nelson River at Manitou Rapids, where the river is confined to a channel about 408 ft. wide. The engineers have not sounded the channel, but from the known discharge of the river and its estimated velocity at this point, the depth must exceed 100 ft. It is probable that the bridge will be a single through truss span of about 480 ft. Outside of this there will only be a few girder spans on the section.

J. Armstrong, Chief Engineer, in an interview, is reported to have stated that he had recently completed an inspection of the work in progress on the line. The steel superstructure of the bridge across

the Saskatchewan River at Le Pas is well advanced, and the bridge will be completed by the end of the year. The bridge, in addition to carrying a railway track, will have a 12 ft. roadway on each side. The grading on the line, which was sublet by J. D. McArthur to McMillan Bros., is well advanced.

Engineer Moffatt, who has been making surveys at Port Nelson, with a view of determining its possibilities, from a railway point of view, as the terminus of the line, since March, returned to Le Pas, via Norway House, July 17.

The question of the terminal on Hudson Bay will be looked into by the Minister of Railways, who has arranged to start out on an inspection trip from Le Pas, Aug. 10, visiting both Port Nelson and Fort Churchill. (July, pg. 361.)

Appointment of Chief Railway Commissioner.

Henry Lumley Drayton, K.C., heretofore Counsel for the city of Toronto, has been appointed Chief Commissioner of the Board of Railway Commissioners for

P294 H. L. Drayton, K.C.,
Chief Commissioner, Board of Railway Commissioners.

Canada, vice James Pitt Mabee, deceased. He was born at Kingston, Ont., Apr. 27, 1869, was educated in England and Canada, and commenced his legal career in 1886, as law student in Toronto. He was admitted to the Ontario bar in 1891 and commenced practice. He was appointed Assistant Solicitor for the city of Toronto in 1893, and resigned in Sept. 1900, to engage in private practice. On Jan. 29, 1904, he was appointed Crown Attorney for the county of York, Ont., and resigned in Nov. 1909 to resume private practice. He was appointed a K.C. Jan. 20, 1908, and on Apr. 25, 1910, was appointed counsel for the city of Toronto.

On the adoption by the city of Toronto, of the Ontario Government hydro-electric system, he was also appointed a member of the commission formed to manage affairs connected with it.

He is a member of the Engineers' Club of Toronto, the Toronto Club, Toronto Hunt Club, Ontario Jockey Club, Rosedale Golf Club, Glen Major Fishing Club and Toronto Racquet Club.

Unconfirmed press reports state that the Chief Commissioner's salary is to be increased to \$15,000 a year, as soon as the matter can be brought before Parliament. In 1908, legislation was passed providing for a reorganization of the Board, so as to consist of six members, a Chief Commissioner with a salary of \$10,000 a year, an Assistant Chief Commissioner at \$9,000, a Deputy Chief Commissioner and three other members at \$8,000 a year each.

Grand Trunk Railway Betterments, Construction, Etc.

E. J. Chamberlin, President, H. G. Kelley, Vice President, and W. G. Brownlee, General Transportation Manager, completed an inspection of the G.T.R. lines, July 15. In passing through Toronto, July 13, the President said a general policy of improvement of the company's terminal facilities between Toronto and Chicago, would be started at once. It was impossible to state what would be done, but the improvements would be made as fast as possible. He had nothing to say as to the Toronto union station plans, as the company had not received any definite notification of the C.P.R.'s intentions. The present plans might be utilized or not, if the C.P.R. did not co-operate, but it was improbable that anything would be done until the definite order had been received from the Board of Railway Commissioners.

Richmond, Que.—Plans have been filed with the town council of Richmond, Que. for a new station building, the estimated cost of which is \$20,000.

St Lambert and Turcot Yards.—Vice President Dalrymple advised the Transportation Bureau of the Montreal Board of Trade, July 4, that plans have been prepared for laying out additional trackage, and carrying out other improvements at the yards at St. Lambert and Turcot. The intention is to handle all through freight at these yards, so as to permit the Montreal yards to handle local freight only.

Brockville Roundhouse.—We are officially advised that there is no foundation for the press report that the roundhouse and shops at present located at Brockville, Ont., are to be removed to Prescott, Ont.

Cobourg, Ont.—The Board of Railway Commissioners has approved plans for new tracks for the G.T.R. in Cobourg, Ont., on lands of W. J. Crossen, and of the Field estate.

Brantford, Ont.—The Board of Railway Commissioners has authorized the company to extend its passing track and re-align its main line over the county line road in Brant tp., Ont.

Galt-Berlin-Elmira Branch.—Residents of the district served by this branch line have petitioned the company to operate it by electricity in order that a better service be given. (July, pg. 343.)

Boulianne and Jalbert, Ltd., has been incorporated under the Dominion Companies Act, with \$50,000 capital, and office at Chicoutimi, Que., to carry on a general contracting business, for the construction of railways, wharves, etc. The incorporators are, T. and H. Jalbert, Chicoutimi; T. and J. Boulianne, Chambord; and R. Lindsay, Roberval, Que.

The F. H. McGuigan Co., Ltd., has been incorporated under the Quebec Companies Act, with \$100,000 capital, and office at Montreal, to carry on a general contracting business for the construction of public and private works of all kinds, including railways, tramways, tunnels, harbors, docks, dredges, telegraph and power plants, etc. The incorporators are, F. H. McGuigan Jr., A. G. B. Claxton, T. R. Kerr, D. Laughlin, and A. S. Hawnes, Montreal.

Traffic Orders by the Board of Railway Commissioners.

The dates given for orders are those on which the hearings took place, and not those on which the orders were issued:—

Classification of Gramophones and Records.

16705. June 5.—Order 16479, May 10, 1912, directing that in the Canadian Freight Classification, gramophones, graphophones, phonographs and records be transferred from their present positions to the Musical Instruments List, and that they be also included in the second class rating applicable to Musical Instruments, all kinds, not otherwise specified, carloads, minimum 12,000 lbs., is to be put into effect by the railway companies not later than July 15, 1912.

Indicating Changes in Tariffs

16900. June 27.—Re indicating changes in freight, passenger and express tariffs: It appearing to the Board that comparison of freight, passenger, and express schedules with those which they supersede or amend, should be facilitated; and in pursuance of the powers conferred by sec. 322 of the Railway Act; and upon the report and recommendation of the Chief Traffic Officer, it is ordered that all freight, passenger and express tariffs, and supplements thereto, applying between points in Canada, or from any point in Canada, to a foreign country, filed with the Board on or after Sept. 1, 1912, shall, except as hereinafter provided, indicate advances thereby made in existing tolls by the symbol "A" (capital), and reductions by the symbol "R" (capital), with the necessary explanatory note, in the following manner, namely:

1. Schedules which show the rates opposite the stations. The proper symbol to be shown against each rate, or each rule or regulation, changed.

2. Schedules in which the rates appear in a table separated from the station list —(a) Unless the station groupings have been varied relatively to their rates, the proper symbol to be shown in the rate table in the manner prescribed in sec. 1. (b) If the station groupings have been varied relatively to their rates, the proper symbol, or symbols, to be shown against the reference on the station page to the rate table, and against each rule or regulation changed.

Provided that if any rates or matter be necessarily so closely printed as to leave insufficient space for the symbols, or if the latter be otherwise unsuitable, and in such cases only, increases shall be printed in full-faced type, and reductions in italics. And it is further ordered that the requirements that the title page, or front cover, of all tariffs and supplements bear, at the top, the word (or words) "Advance," "Reduction," "Re-issue," or "New Rates," as the case may be, is not hereby abrogated.

Eye and Ear Tests for Railway Employees.

The Assistant Chief Commissioner, Board of Railway Commissioners, D'Arcy Scott, gave the following judgment, June 28:—

On November 9, 1910, the Board issued order 12225, which, among other things, required that certain employees on train and engine service should undergo an eye and ear test before a competent examiner. The railway companies do not interpret those provisions of the order in the same manner, and a question has arisen as to whether the examination of the seeing and hearing of employees should take place indoors or out in the open, under conditions as they would get them in actual employment on the railway.

The matter was discussed at length before the Board on Oct. 3, 1911, and judgment was reserved.

Representatives of different companies had submitted a majority and a minority report in connection with the matter, and the Board has had the benefit of a very carefully prepared report from its Chief Operating Officer. A majority of the railway companies desire to have an indoor test only, both for those seeking employment in the railway service for the first time, and those already in the employ of the company who must pass a satisfactory test in order to retain their positions, or be promoted.

The minority report of the railway companies, which is practically endorsed by the employees' representatives, recommends the indoor test under certain conditions. Undoubtedly, the indoor test is more convenient for the railway officials, and more accurate than the outdoor test, and in some respects a more definite standard of seeing and hearing can be established by it. The outdoor, or field test, is a difficult one to submit a man to on all occasions, owing to the changeable conditions of the weather, atmosphere, etc.—but under favorable circumstances it is, I think, by far the more satisfactory test, especially for a man who has had experience in railway service. I think, therefore, that we might lay down the following general principles to govern in this matter:

1. No person shall be employed in railway service until he has passed the indoor test satisfactorily.

2. Any employee going up for a periodical examination or an examination for promotion, shall be examined by the indoor test; and in case he fails to pass the indoor test satisfactorily he shall be given an outdoor test, according to the uniform rules submitted herewith; and in such case the latter shall be taken as the governing test; and, during the outdoor examination, the candidate shall be permitted to wear glasses, as provided for in the said rules, if he wishes to do so.

For the purposes of this memorandum, promotion means going from fireman to engineer, or from trainman to conductor; but it does not mean a change from freight service to passenger service without a change of rank, such as a freight engineer being made a passenger engineer, or a freight conductor being made a passenger conductor.

As to the wearing of glasses while on duty, I think any employee who requires to use glasses should be encouraged to do so, but he should be required always to carry a duplicate pair with him lest an accident may happen to those he is wearing.

There are a number of details respecting the method and character of both the indoor and outdoor tests to which the Chief Operating Officer has given careful consideration. He has submitted a code of rules on standards of visual acuity, which is attached hereto, and which he recommends for the approval of the Board as uniform rules governing the determination of visual acuity, color perception, and hearing of employees on steam railways. I think the Board should adopt these rules as its standard.

This judgment was concurred in by Commissioners Mills and McLean. The order had not been issued up to July 23.

Tests on the Grand Trunk Railway.

We are officially advised that the Board's decision will make very little difference on the G.T.R., as that company's tests for prospective employees have always been very rigid and all trainmen, yardmen, engineers, and firemen are required to go through an eye and ear test every three months of their service. The indoor tests consist of holding a set of cards with letters of different sizes at a distance of 30 ft. from the candidate; a glass being placed over one eye while the other is being tested. There is also a small card with small letters which is held at a distance of 30 ins. Each employee must be able to distinguish

all letters. After this reading test, comes a color test, which consists of telling different shades of yarn. In this a box containing 67 shades and 7 shades of each color is used and an employee must be able to distinguish between them. In the hearing test one ear is plugged and a clerk recites a phrase which must be repeated correctly by the employee who is 30 ft. away.

Canadian Northern Railway Earnings, Etc.

Gross earnings, working expenses, net profits, increases or decreases, compared with those for 1910-11, from July 1, 1911:—

Earnings.	Expenses.	Net Earnings.	Net Increase
July \$1,475,800	\$1,114,300	\$361,600	\$13,400
Aug. 1,420,600	1,105,900	314,700	51,700
Sept. 1,576,400	1,157,000	419,400	38,200
Oct. 2,028,900	1,348,500	680,400	99,900
Nov. 2,001,500	1,336,300	665,200	106,300
Dec. 1,831,400	1,327,600	503,800	144,400
Jan. 1,223,100	1,004,400	228,700	122,000
Feb. 1,203,400	965,800	237,600	101,800
Mar. 1,572,700	1,145,900	426,800	72,000
Apr. 1,608,100	1,205,000	403,100	42,000
May 1,822,100	1,364,000	458,100	54,900

\$17,769,100 \$13,074,700 \$4,694,400 \$846,800
Inc. \$4,035,200 \$ 3,188,400 \$846,800

Approximate earnings for June, \$1,769,500, against \$1,465,300 for June, 1911.

Mileage in operation 3,851, against 3,354, same period, 1911.

Canadian Pacific Railway Earnings, Etc.

Gross earnings, working expenses, net profits, increases or decreases, compared with those for 1910-11, from July 1, 1911:—

Earnings.	Expenses.	Net Profits.	Increases
July \$ 9,661,818.14	\$5,958,789.81	\$3,703,028.33	\$218,408.74
Aug 10,481,904.42	6,346,333.41	4,075,671.01	388,898.68

Inc. \$17,319,986.18 \$11,543,505.56 \$5,776,480.62

Approximate earnings for June, \$10,848,000, against \$9,040,000 for June, 1911.

Commencing with July 1, the mileage in operation, was increased to 11,117.

Grand Trunk Railway Earnings, Etc.

Following are the earnings of the G.T.R., C.A.R., G. T. Western Ry., and D.G.H. and M. Ry., for May, as compared with those for May, 1911:—

GRAND TRUNK RAILWAY.			
	1912.	1911.	
Earnings	\$3,366,300	\$3,060,000	
Expenses	2,359,300	2,041,000	
Net earnings	\$1,007,000	\$1,019,000	
CANADA ATLANTIC RAILWAY.			
	1912.	1911.	
Earnings	\$202,100	\$ 185,650	
Expenses	204,400	177,400	
Net earnings	\$ 2,300	\$ 8,250	
GRAND TRUNK WESTERN RAILWAY.			
	1912.	1911.	
Earnings	\$557,400	\$ 528,300	
Expenses	441,300	485,200	
Net earnings	\$ 116,100	\$ 43,100	
DETROIT, GRAND HAVEN AND MILWAUKEE RY.			
	1912.	1911.	
Earnings	\$177,500	\$ 168,000	
Expenses	173,600	160,000	
Net earnings	\$ 3,900	\$ 8,000	

Approximate earnings for June, \$4,653,475, against \$4,437,438 for June, 1911.

TRAFFIC RECEIPTS OF THE SYSTEM.

Aggregate from Jan. 1, to June 30:—

	1912.	1911.	Increase.
G. T. R.	\$18,605,299	\$17,333,392	\$1,272,907
C. A. R.	1,046,129	999,631	46,498
G.T.W.R.	3,202,444	3,197,363	5,081
D.G.H. & M.R.	1,017,878	1,006,049	11,829
Totals	\$23,871,750	\$22,536,435	\$1,335,315

Canadian Pacific Railway Construction, Betterments, Etc.

Windsor St. Station, Montreal.—The interior and other work on the enlarged Windsor St. station and office building had been so far completed that the members of the staffs began to take possession of their new quarters, June 17. It is expected that the transfer of the various departments will be completed by November.

The entire ground floor of the station will be occupied by shops, and offices have been reserved for the Bank of Montreal. The main entrance at the corner of Windsor and St. Antoine streets, consists of a vestibule 40 ft. square, while the general waiting room is 58 by 132 ft. Off this is a ladies' waiting room, a nursery, and smoking room, all with lavatory accommodation. The refreshment room, and dining room are conveniently situated and special provision is made for the immigrant traffic.

Campbellford, Lake Ontario and Western Ry.—The Board of Railway Commissioners has approved location plans for the line from mileage 94 to 97, and from mileage 106.17 to mileage 121 from Glen Tay, Ont.

A bylaw has been passed by the taxpayers of Trenton, Ont., granting a free site for a roundhouse and station, with a nominal assessment for ten years, the company agreeing to make Trenton a divisional point.

The contractors are pushing construction as fast as possible. Malvern is the centre of the construction work at the east end of the line, and other centres are at Trenton, working easterly, and Bayside, working westerly. Deeks and Hinds, the general contractors, have their headquarters at Agincourt.

Agincourt to Toronto.—In connection with the building of the new Lake Shore line, J. W. Leonard, Assistant to Vice President, is quoted as stating that it had been decided to build a second track on the present line easterly from Yonge St. through Leaside, Donlands, and Wexford, to near Agincourt, where the Campbellford, Lake Ontario and Western Ry. joins the main line. The contract for the substructures of the new bridges to carry the double track across the main Don, the west Don, the Belt Line ravine, and the reservoir ravine would be let at once, so that the steel work could be put up in the spring.

Georgian Bay and Seaboard Ry.—A regular freight and passenger service was inaugurated on this line July 2, the Board of Railway Commissioners having authorized the opening for traffic of the 7 miles from Coldwater to Bethany, Ont. The trains run through to Port McNicoll, to and from which point the company's upper lake steamers sail five days in the week, for Port Arthur and Port William.

North Toronto Improvements.—J. W. Leonard, Assistant to the Vice President, in an interview in Toronto, July 16 is quoted as saying, that the plans for the new union station at North Toronto with the Canadian Northern Ry. had been approved, and that work would be begun within a month. The building would be sufficiently large to accommodate satisfactorily the two railways which are to use it. Its size and appointments would be in keeping with the rapid growth of the city, and worthy of the Toronto of the future. He said definitely that the company would not build a hotel in Toronto, as has frequently been rumored.

The Board of Railway Commissioners has approved plans for the track elevation at North Toronto, and has ordered that plans be filed for the subways at Yonge St. and Avenue Road. The Board has also approved plans for the elevation of the C.P.R. and the Canadian Northern Ry. from Summerhill Ave. to Dovercourt Road, with some alterations.

Toronto Freight Yards.—The tearing down of the old government house and

the other buildings on the King-Wellington St. site is practically completed, and it is expected that the new freight sheds on the site will be under construction early in August.

In connection with the laying out of the yard an extensive piece of work is being carried out along the Front St. embankment, east of Bathurst St. A retaining wall is being built, in such a way that 25,000 cubic yards of the present bank can be cut away, to form a lead starting from under the Bathurst St. bridge, up to the yards. It is expected that this part of the work will be completed by the end of August.

South Ontario Pacific Ry.—The first section of this railway, viz., from Guelph Jct. to Hamilton, Ont., 16.3 miles, was opened for traffic July 1.

Sudbury-Port Arthur Second Track.—The second track work between Sudbury and Port Arthur, to which reference was made on pg. 349 of our last issue, is being carried out under the supervision of B. C. Huffman, for the Dominion Construction Co., which has the contract. His headquarters are at Sudbury.

In an interview in Toronto, July 16, J. W. Leonard, Assistant to the Vice President, is quoted as stating that the 60 miles of work already let would be completed this season.

Spur Lines at Port William, Ont.—The Board of Railway Commissioners has directed the company to build a spur line along Neebing Ave., for the benefit of the industrial plants being established along the Kaministiquia River.

North Transcona Freight Yards.—Press reports state that contracts for \$2,000,000 of work have been let in connection with the laying out of the new freight yards at North Transcona, Man.

Portage la Prairie to Brandon Second Track.—The Board of Railway Commissioners has authorized the opening for traffic of the second track from Melborne to Carberry, Man., six miles.

Estevan Westerly.—A route map for a line from Estevan, Sask., westerly for 96.5 miles has been approved by the Minister of Railways.

Pasqua-Caron Second Track.—The Board of Railway Commissioners has authorized the opening for traffic of the second track from Moose Jaw to Caron, Sask., 16.2 miles.

Touchwood Hills Branch.—The Minister of Railways has approved of a route map for a revision of the Touchwood Hills branch, for 48.8 miles.

Moose Jaw Southwesterly.—The Board of Railway Commissioners has authorized the opening for traffic of this branch from mileage 27.4 to 35, and has approved of location plans for its extension from mileage 37.85 to 64.47. The plans for this branch show that it will connect up with the line now under construction from Swift Current, southeasterly.

Moose Jaw Northwesterly.—The bridge across the Saskatchewan River, a little north of Outlook, which was described on pg. 215, of our issue of Mar., 1910, is expected to be completed early in November. This will connect up Moose Jaw by means of the branch already completed, with the Portage la Prairie-Wetaskwin line at Macklin.

Swift Current, Northwesterly.—The Board of Railway Commissioners has authorized the opening for traffic of this branch from mileage 33 to 34.8, a point beyond Cobri, Sask.

Weyburn-Lethbridge Line.—The Board of Railway Commissioners has approved of location plans presented by the Alberta Ry. and Irrigation Co., which is building the western end of the line, for the route from Stirling, Alta., easterly for 37.14 miles. The contractor for the

grading of the first 25 miles, has the work well in hand, and the bridge building gang started work at Stirling, July 8.

Sedgewick Southerly.—A route map for a line of 23.6 miles from Sedgewick, Alta., southerly, has been approved by the Minister of Railways.

Suffield Southwesterly.—Grading is in progress south of the Bow River, on the section of the line from Kipp towards the mileage under construction from Suffield, Alta.

Alberta Central Ry.—The Minister of Railways has approved of route maps for this line from mileage 140 to the Yellowhead pass, Alta., 165 miles.

Calgary to Vancouver Second Track.—We are officially advised that five engineering parties are in the field preparing plans and estimates for the building of a second track between Calgary, Alta., and Vancouver, B.C., 812 miles. The location surveys have not yet been sufficiently far advanced to state definitely what changes in alignment, etc., will be made. F. F. Busted, is Engineer in charge of grade revision and double tracking, Calgary west, with office at Kamloops, B.C. Press reports state that one of the results of surveys made, show that by the construction of a five mile tunnel through the Selkirk range, starting at Bear Creek and terminating below Glacier, a gradient of less than 1% against western traffic can be obtained, and that by a division at Notch Hill, just east of Kamloops, the 1% gradient could be obtained from Calgary to Vancouver.

Kaslo and Slocan Ry.—Some temporary work has been done on the existing narrow gauge line in order to permit the operation of trains for construction purposes, and to enable the present mineral traffic to be got out, pending the complete reconstruction of the line.

Trail to Metalline, B.C.—Press reports state that a survey has been made for a line from Trail, B.C., to Metalline, on the International boundary, where connection can be made with a branch line of the Idaho and Washington Northern Rd. The last spike of this line was driven, June 24.

Grand Forks, B.C.—An agreement has been reached between the city council, the C.P.R. and the Kettle Valley Lines, whereby the two railways will lay out union terminals in the city. The city gives a free site and exemption from taxation for ten years. The companies will make an initial expenditure of \$200,000 on buildings.

Grain Elevators at Vancouver, B.C.—George Bury, Vice President, informed the Vancouver Board of Trade recently that the company would have a grain elevator ready at its deep water terminals by the end of 1914. He would be prepared towards the fall to give the Board fuller information as to this, and the company's other plans for handling the business at Vancouver. (July, pg. 344.)

Sliding of Railway Fills built on ground which is underlaid by limestone strata are prevented on parts of the St. Louis and Southwestern Ry. by breaking up the surface of the rock with dynamite, according to J. P. Warren, Assistant Roadmaster, at Tyler, Tex. Fills on ground of this character had been found to give trouble due to the seepage of water through the overlying ground to the surface of the rock, causing slipping at that point.

The third annual sports of the C.P.R. European staff, were held at Acton, Eng., June 29.

A London, Eng., cable states that Herr Van Kramer, in conjunction with Herr Van Kapp, has invented an apparatus by which a signalman is enabled to stop a train at a distance of 20 miles by merely pressing a button in his cabin.

The Death of Cecil B. Smith.

Cecil Brunswick Smith, Ma. E., M. Can. Soc. C.E., one of the most active and prominent engineers of Canada, died at his home in Toronto, on July 1. Two weeks before, he had been engaged in his customary professional activities on the Pacific coast. At that time he consulted a specialist in California, who warned him that he was suffering from an internal cancer and had not long to live. He returned to his home in Toronto, to close up his affairs as soon as possible. Until the specialist's examination, Mr. Smith had no knowledge of his serious malady.

He was born at Winona, near Hamilton, Ont., 48 years ago. He was educated at the Collegiate Institute at Hamilton and the School of Applied Science of McGill University, Montreal, Que., where he graduated in civil engineering in 1884, when but 19 years of age. For his high standing in scholarship he was awarded the Governor General's Gold Medal for that year.

Following his graduation he was Resident Engineer on construction of the Nipissing and Pacific Junction Ry., now part of the Grand Trunk Ry., and later of the St. Catharines and Niagara Central Ry. From 1887 to 1888 he was Resident Engineer on the construction of C.P.R. between Woodstock and Windsor, Ont.; and for a year was Locating Engineer of the Toronto, Hamilton and Buffalo Ry.

After two years in the United States, spent as division engineer and chief assistant engineer of railways constructed in North and South Carolina, Virginia and Maryland, he returned to Canada to become Assistant Professor of Civil Engineering at McGill University, a position, he continued to hold for five years, until 1898. During this period he made a special study of the characteristics of Portland cement and was the author of several papers dealing with this subject. He also wrote a text book on railway engineering.

In 1898 he was appointed locating engineer of the C.P.R. on the line between Toronto and Sudbury, Ont. The following three years he served as Assistant City Engineer of Toronto. In 1901 he was appointed Resident Engineer on construction for the Canadian Niagara Power Co., and between 1901 and 1905 built the present plant of that company at Niagara Falls, Ont. At the close of this work he became Chief Engineer of the first Hydro-Electric Commission of Ontario and organized the very complete water power surveys which were conducted in 1906 and 1907. The reports of this work have formed the basis of all water power developments in the Province since.

During the same period he also served as Chairman and Consulting Engineer for the Timiskaming and Northern Ontario Ry. Commission. In 1907 he retired from both commissions and established the firm of Smith, Kerry & Chace, consulting engineers, etc., of Toronto. As senior member of this firm he had the supervision of planning and constructing some of the largest hydro-electric power plants in the Northwest, among them the 60,000 h.p. development on the Winnipeg River, near Winnipeg, Man.; the 19,000 h.p. plant for the Calgary Power Co., on the Bow River in Alberta; the 24,000 h.p. development of the Mount Hood Ry. & Power Co., near Portland, Ore., and the 15,000 h.p. plant on the Snake River in Idaho for the Crane Falls Power and Irrigation Co. He served these enterprises not only in an engineering capacity, but largely directed their organization and financing. In this connection he served as president, manager or vice president of several of these large development companies.

He was ever active in promoting the welfare of his profession and was a mem-

ber of the Institution of Civil Engineers of Great Britain, of the Canadian Society of Civil Engineers, of which he was a member of the Council and a past Vice President; the American Society of Civil Engineers, the Engineers' Club of Toronto and the Oregon Society of Civil Engineers.

He was one of the busiest of men, and his early death may perhaps be attributed in some degree to the pressure under which he worked, taking him back and forth across the continent many times in the course of a year. It was a well considered plan of his to retire to a strictly consulting practice as soon as the last of the great works which he had under way was completed; but apparently he had miscalculated his strength and was denied the termination for his career, which he had so earnestly desired.

He is survived by a widow and two sons.

The Section Foreman Problem.

By P. J. M. Woolyng, Roadmaster, C.P.R.,
Lethbridge, Alta.

I would advise the following measures to improve the situation facing us regarding the scarcity of good section foremen:—

1. Give the section men a fair and square deal. Let them understand that they are just as important as any other class of railway employees and show them that it is recognized that their service is important.

2. Pay all regular laborers the highest local laborers' wages, so that they will be encouraged to remain and work steady on the track.

3. The foreman should show his men how to do different kinds of work, and explain whenever convenient why it should be done in such a way. When a laborer is far enough advanced, give him a show to do different kinds of track work under the foreman's supervision, and if he does wrong, the foreman should be prompt to rectify him. Before he gets any promotion, move him to some section, in a yard, or extra gang, where some heavy work is going on under a good practical foreman; and let him work long enough to get familiar with heavier work than he would be able to practice on an ordinary section.

4. When the roadmaster calls a meeting of his foremen to discuss track work, the men that are nearest in line for promotion should, if possible, be present and be encouraged to take an active part.—
Railway Age Gazette.

Canadian Car Service Bureau.—At the annual meeting in Montreal July 11, representatives of the Canadian Pacific, Central Vermont, Grand Trunk, Quebec Central and Toronto, Hamilton and Buffalo Railways were re-elected members of the executive board. M. Magiff, Superintendent Telegraphs and Car Accountant, Central Vermont Ry., was re-elected Chairman. The Manager is J. E. Duval.

Brockville Roundhouse.—We are officially advised that there is no foundation for the press report referred to in our last issue, stating that work was about to be started on an addition to the roundhouse at Brockville, Ont.

L. J. Papineau has been appointed Supervising Engineer of the power development works in course of construction by the Dominion Public Works Department, on the St. Lawrence river, in the vicinity of Montreal.

L. D. Oakley has been appointed Line Auditor, Western Lines, Dominion Express Co., for the inspection of offices west of, and including, Port Arthur, with office at Winnipeg; J. Richardson, Line Auditor, Eastern Lines, continuing the inspection of offices east of Port Arthur, Ont., with office at Toronto.

Grand Trunk Terminal Warehouse Co., Ltd.

A company with this title has been incorporated under the Dominion Companies Act, with a capitalization of \$10,000,000 (1st mortgage, 30 year sinking fund bonds), of which \$5,000,000 are issued, and \$6,500,000 are issued. The bonds which \$5,500,000 are issued. The bonds have been offered to the public at 95 with a bonus of 50% of common stock.

In view of the appreciable benefit to be derived by the railway companies from the establishment of the proposed warehouses, the organization of the G.T.T. Warehouse Co., has been carried through with the co-operation of the Grand Trunk and G.T. Pacific Railways, and the warehouse Company has secured an operating contract with these railways, extending over 30 years. The railway companies undertake to provide sites for the establishment of the company's warehouses at various points, at nominal rentals, during the first period of the leases, and for the balance of their term at extremely low rentals.

The ultimate policy of the company is to provide warehouses at all the important commercial distributing centres in Canada, such plants to be situated upon, or accessible to, the lines of the G.T. and G.T. Pacific Railways, and their subsidiary companies. Plans have been prepared for the acquisition of property and the construction of warehouses at Montreal, which will give the company available warehouse space of 465,000 sq. ft. A warehouse will also be immediately established at Toronto; construction will be begun in the various other cities so soon as the question of location, capacity and other details finally decided upon. The warehouses will be of the most modern fireproof construction, and the most up to date labor saving devices will be installed. Cold storage facilities will also be installed at certain points.

As before stated, it is proposed to provide at Montreal warehouse buildings which will have a total rentable space of 465,000 sq. ft. This figure is arrived at after making conservative allowance for that portion of the total space which will be occupied by elevators, posts, passageways, heating, etc.

The income which the company will derive from the rental of this space for warehousing and storage purposes is estimated at 60c. per sq. ft. per annum, thus giving annual gross receipts of \$279,999.00. From this is deducted the total expenses of operating the warehouses, including taxes, heating, labor, office and other general expenses, which will not be in excess of 15c. per sq. ft. of rented space or 69,750.00.

Leaving an annual net revenue of \$209,250.00

It is estimated that for the construction of the Montreal buildings, and the purchases of the land, bonds will require to be issued to the amount of \$1,500,000.00. With the issue of a total \$5,000,000 of bonds, and the construction of additional warehouses at Toronto and other Western points, the net revenue of the company would be proportionately increased, and based on the above estimate would be 697,500.00. Deduct:—
Interest on \$5,000,000 bonds \$ 300,000.00
1% sinking fund 50,000.00
\$350,000.00

Leaving a total amount applicable on the common stock of \$347,500.00
Or at the rate of over 6% per annum.

The directors are W. Wainwright, J. E. Dalrymple and R. S. Logan, three of the G.T.R. Vice Presidents; J. N. Green-shields, President, Quebec Savings and Trust Co., and G. Bird, General Manager, International Bank.

Electric Railway Department

The Halifax Electric Tramway Co. and its Employees.

The employees of the Halifax Electric Tramway Co., after a series of meetings, recently forwarded to the company a schedule of wages, etc., which they desired the company to adopt, and a list of alleged grievances for adjustment.

The proposed wage schedule called for the rates to be as follows: First year, 21c. an hour; second year, 23c.; third year, and over, 25c.; snow work, 30c.; and awaiting orders, at regular car time; Sunday work and overtime, time and a half; for instructing new men, one day's pay in addition to time taken by instruction; wages to be paid once in seven days; uniforms, men to pay half cost for the first year, company to provide them free thereafter, suit once a year, overcoat every second year. For the shed men, the rates asked were as follows: Motor and truck repair men, first year, 21c.; second year, 23c.; third year, 25c.; armature winders, first year, 21c.; second year, 23c.; third year, 25c.; car cleaners, 21c. an hour; snow work, 30c. an hour.

The rates hitherto paid motormen and conductors were first year, 18½c.; second year, 19½c.; third year, 20c.; fourth year, 21½c.; fifth year, 21c.; sweeper time, 22c. an hour. The men paid half cost of uniforms up to five years, after which the company provided them free.

The company agreed to pay the following rates, beginning July 1: First year, 20c.; second year, 21c.; third year and up, 23c.; sweeper work, 25c.; Sunday work, full week-day time, and to provide uniforms free after three years service, the men to pay half cost up to three years.

The extra pay would amount to about \$5,500 a year, which follows an advance of about \$6,000 made in November last.

This does not appear to have been satisfactory to the men, as at a meeting on July 12, they decided to apply for the appointment of a conciliation board, under the provisions of the Industrial Trades Disputes Act, and named J. T. Joy, President, Trades and Labor Council, as their representative.

The General Managership of the Montreal Tramways Co.

James E. Hutcheson, heretofore Superintendent and Purchasing Agent, Ottawa Electric Ry. has been appointed General Manager, Montreal Tramways Co., to succeed Duncan McDonald, who has resigned in order to attend to his many important personal interests.

Mr. McDonald has opened an office at 526 Transportation Building, Montreal, and the various interests with which he is connected will be managed from there. Among these are the Montreal Tunnel Co., the Prepayment Car Sales Co., of which he is President, and which controls the pay-as-you-enter car, of which he is one of the patentees, and also the pay-within car. He is also a director of the Dominion Park Co., Montreal, of which he was one of the principal founders. He was born at St. Thomas de Montmagny, Que., June 17, 1859, and removed to Montreal in 1875. He entered Montreal St. Ry. service in 1881, as a driver, in order to acquire a thorough knowledge of street railway work from its very commencement. He was soon changed to conductor, and after about a year in that capacity, was appointed roadmaster. In 1886 he severed his connection with the company, and engaged in other business. Anticipating the progress that the trolley system would make, he went to St. Paul

and Minneapolis, Minn., in 1889, and secured a practical knowledge of electric railways. He returned to Montreal in 1892, and re-entered Montreal St. Ry. service as inspector, and in 1894 was appointed Superintendent of Transportation, which position he held until 1898,

Duncan McDonald.

when he resigned to become General Manager, Parisian Tramway Co., with headquarters in Paris, France, in which position he organized the Parisian system to a high degree of efficiency. In 1903 he returned to Montreal, having been offered the position of Manager, Montreal St.

James E. Hutcheson.

Ry., which position he held to Nov. 1910, when he was appointed General Manager, and on the recent reorganization of the company, under the name of the Montreal Tramways Co., he was appointed General Manager of the new company. He is a director of the Automobile Club

of Canada, a member of the Civil Engineers' Society of France, a member of the Institute of Electrical Engineers, Eng., and has been connected with the Canadian Street Railway Association since its inception, having been President for two years, 1909-1910 and 1910-1911, and is still a member of the executive committee.

J. E. Hutcheson was born at Brockville, Ont., Sept. 15, 1858, and entered railway service in 1874, in the G.T.R. mechanical department, afterwards serving in that company's ticket, freight and telegraph departments. In 1884 he was appointed a dispatcher, C.P.R., at Ottawa, in 1886 Chief Dispatcher and in 1888 Trainmaster, which position he held to 1891, when he took charge of the Ottawa Electric Ry. Co.'s operation. He has taken an active part in the Canadian Street Railway Association's work since its inception, having served continuously as a member of the executive committee, and also having been Vice President, and for the year 1908-09, President. He was, for several years, a member of the 43rd. Regiment, retiring with the rank of Major, in 1910, on his return from England, where he acted as Adjutant in charge of the Canadian team at Bisley.

The Toronto Railway and its Employees.

As the result of negotiations between the company and its employees, an agreement was signed, July 3, outlining the terms of employment to June 16, 1915, the terms offered by the company being accepted by the men, as a compromise. There is to be an increase of 2½c. an hour, all round, and 4c. an hour extra will be paid for Sunday work. Shedmen are to receive a half holiday on Saturdays. The first year men are required to pay full cost of the first uniform. The men will pay half the cost of the second, and further uniforms will be provided free by the company.

The old rate of wages was, for first year men, 21c.; second year, 23c.; third year, and up, 25c for motormen and conductors; for shed men, foremen, 25c; assistants, 22c.; car washers, 21c.; motor and truck repair men, 21c.; second year, 23c.; third year 25c.

It is stated that the increase in wages will absorb about \$130,000 a year.

Montreal Tramways Mutual Benefit Association.

The report for the year ended Apr. 30, shows that during the year there were 1,173 members disabled through sickness and injury; 626 visits made by doctors; 7,587 consultations; 5,811 prescriptions issued; \$10,274.10 paid for sickness and injury, \$1,725.95 for medicine; \$354.50 for pensions; \$296.31 for withdrawals and \$12,533.35 for death and burial insurance. There were 29 deaths during the year. An act amending the association's charter was passed, changing the name from the Montreal Street Railway Mutual Benefit Association. The annual picnic resulted in a profit of \$8,149.20. The management committee reported a special Christmas donation to the funds of \$4,000 from the company, making the total contributions received from the company, \$18,915.61, which, added to the fees and dues from the members, \$15,812, and the proceeds of the picnic, interest, etc., \$12,926.49, makes the total revenue for the year, \$47,654.10. The expenses being \$34,939.32, there is a surplus of \$12,714.78.

Sale of Dominion Power and Transmission Co. Not Carried Out.

The proposed sale of the Dominion Power and Transmission Co.'s properties, in and around Hamilton, Ont., including the Hamilton St. Ry. and four radial electric railways to Sir Wm. Mackenzie and his associates, which was referred to in Canadian Railway and Marine World for July, has not been carried out, and parties on both sides of the transaction say that the negotiations are off.

Commutator Slotting Jig at Halifax Electric Tramway Company's Shops.

At the Halifax Electric Tramway Co.'s shops, D. B. Logan, Foreman Machinist, a method of slotting the armature coil wire lead slot in the commutator segments, has been devised. A lathe is employed for the purpose in conjunction with the jig shown in the accompanying illustration.

The jig is bolted on the tool post of the lathe carriage. Over the vertical arbor, the dismantled commutator is slipped, the diameter of the arbor corresponding to that of the commutator bore. A milling cutter saw, on a mill-

the arbor without threading the arbor from the bottom up to that point.

The jig in operation is mounted on the tool post stand, with its swing adjustment in a plane at right angles to the lathe centre line. The arbor, swung over at an angle towards the centre line, carries the commutator dismounted from its carrying shaft. It is set in such an angle and position that when it is moved across against the cutter by the carriage cross screw, the cutter strikes the corner that is to be slotted for the entry of the coil connecting wires. The commutator is set by hand in the positions for slotting each sector independently, and there held during slotting, being then swung over to the next sector.

Electric Railway Notes.

The first pay-as-you-enter cars to be operated in Great Britain, have been put into service at Gateshead, Eng.

G. E. Wadland, heretofore Treasurer, Sarnia St. Ry., has also been appointed Manager and Secretary vice H. W. Mills, deceased.

The Guelph Radial Ry. is reported to be in the market for a snow sweeper, for delivery in time for use during the coming winter.

The Regina Street Ry. has received four single truck, pay-as-you-enter cars, from the Preston Car and Coach Co., Preston, Ont.

The Sarnia St. Ry., Sarnia, Ont., is building a car barn and machine shop of concrete blocks, with gravel roof. The cost is reported as about \$12,000.

Superintendent Mickle of the Kingston, Portsmouth and Cataraqui Ry., Kingston, Ont., recently announced that cars would be run on Sundays only in very warm weather.

The Dominion Power and Transmission Co. has received three suburban cars, for its radial lines out of Hamilton, Ont., from the Preston Car and Coach Co., Preston, Ont.

The Moose Jaw Electric Ry. has put a Sunday car service in operation on its lines in Moose Jaw, Sask., following the recent vote of the citizens granting the right to do so.

One fatal, and one non-fatal accident were reported during May, in connection with the operation of electric railways in Canada. The death was due to a car motor falling on a man.

F. D. Powers, heretofore freight traffic expert for the Vancouver board of trade, has been appointed Freight Traffic Agent, British Columbia Electric Ry., with office at New Westminster.

The Quebec Court of Appeal has dismissed the appeal of the Montreal Street Ry. against the decision of the Recorder's Court fining the company \$25 for carrying freight on its lines in the city.

The Calgary Municipal Ry. has received one double truck sprinkler, one scenic car, and one single truck car, completing an order of 12, from the Preston Car and Coach Co., Preston, Ont.

Members of the street railway committee of the St. Thomas, Ont., city council, visited various cities in the U.S. recently, for the purpose of inspecting types of street cars, and their method of operation, with a view to a betterment of the municipal street railway system. It is stated that the pay-as-you-enter cars are favored, and quotations are being received.

J. B. Ingersoll, who has been engaged for some time past as electrical engineer on the British Columbia Electric Ry. Vancouver, B.C., is reported to have left that company's service to become manager of the Kootenai Power and Construction Co., which is building a 40,000 h.p. hydro-electric plant at Kootenai

Falls, Montana, with a transmission line of 170 miles.

It has been decided to appeal against the decision in the action of Kerley, against the London and Lake Erie Ry. and Transportation Co. to recover penalties for the operation of cars on Sundays between London and Port Stanley, the full text of which was given in our last issue, pg. 365. Pending the hearing of the appeal, Sunday traffic on the line has been suspended.

As a result of a conference between the Winnipeg board of control and the directors of the Winnipeg Electric Ry., July 5, following a number of previous conferences, it is said that an arrangement has been made relative to all points in dispute between the city and the company, and that an official announcement of the settlement will be made when all the details have been worked out.

The question whether the decision in the action of Kerley against the London and Lake Erie Ry. and Transportation Co., as to the operation of cars on Sunday, affects the Brantford and Hamilton Ry. is being considered by the latter's management. The city clerk of Hamilton has advised the city council that the decision only affects companies whose lines have been built and brought into operation since 1897.

J. D. Burpee, Accountant, Ottawa Electric Ry., has been appointed Superintendent and Purchasing Agent, vice Jas. E. Hutchinson, resigned to enter Montreal Tramways Co.'s service. He was born at Ottawa, Apr. 25, 1876, and commenced railway work in 1891 under H. B. Spencer, Superintendent, District 4, Eastern Division, C.P.R., Ottawa. He entered Ottawa Electric Ry. service in 1893, since when he was, to 1896, stenographer; 1896 to 1898, cashier and paymaster; 1908 to 1912, Accountant, during which time he also acted as assistant to the Superintendent and Secretary.

S. D. Egan, whose appointment as Superintendent, Regina Municipal Ry., Regina, Sask., was mentioned in our last issue, was born at Auckland, New Zealand, Sept. 23, 1866, and received training at the Government School of Engineering, Chatham, Eng., where he qualified class first, as mechanical engineer, land and sea, and gold metallist for general knowledge construction and operation of steam and electric railways. He has had a varied railway experience in Europe, Australia, Egypt, the Sudan, Jamaica and Africa, having served on the Cape to Cairo and Rhodesian railways, both in construction and operation. He has been in Canada about six years, and has served, at various times, on the C.P.R., Mackenzie, Mann and Co., Ontario Government, city of Toronto, and as expert for the Board of Railway Commissioners.

Advantages of Electric Locomotives.—

A recent paper on electric locomotives for the handling of freight in railway yards and in mining, brought out clearly certain advantages over steam locomotives apart from the elimination of fire and smoke and the difference in fuel efficiency of the central station boiler and engine and the (smaller) locomotive boiler and engine. The electric locomotive can be relied upon, as long as the line voltage is maintained, to develop its full power at any time, being independent of the state of a boiler, the skill of a fireman, or the quality of fuel. The track adhesion is better—sometimes as much as 20% better—because the torque of the driving wheels is uniform throughout each revolution, and there is not the same tendency to slip when starting under load as in the steam locomotive. The traction can be increased indefinitely by sanding the rails, since the electric locomotive can draw power indefinitely from the line. No time is lost on the road for coaling, watering, boiler tending, or waiting for steam pressure to rise.

Jig for Carrying Commutator while Slotting in the Lathe.

ing arbor held in the lathe spindle, is made to revolve at a high velocity, cutting the slots in the commutator, which is fed up to the cutter by the tool carriage.

The construction of the carrying jig is interesting. To the vertical flange of the cast iron base, which is made to fit the tool post stand, there is attached an arbor, the lower end of which is slotted to fit over this flange, a 3/4 in. bolt holding the two together. This construction allows for the arbor being inclined from the perpendicular when in service, as will be explained further on. On this arbor there is a wrought-iron ring or collar, adjustable within limits along the arbor, on which the mounted commutator rests. The method of attaching the ring to the arbor, in order that it might be adjustable, is rather unique. Were the ring itself threaded, the arbor would of necessity have to be threaded from its lower end up to the section now required; that is, the carrying bolt section would be threaded. To obviate such a design, the unusual construction followed became necessary. The ring, set true with the arbor, was blocked up from its lower surface, and the annular recess thus formed between the ring and the arbor thread poured with molten babbitt. This formed a perfect internal thread in the supporting ring, allowing the necessary lengthwise adjustment on

Car Equipment with Reference to Safety Devices.

By A. E. Beck, Claims Agent, British Columbia Electric Railway.

"It must be made difficult for employees to cause accidents or for the public to meet with them," is a good rule for the management of railway corporations to ever have in the mind's eye. It is not just to hold a railway corporation or any person wholly responsible for that which could not be wholly prevented, but there are negligent acts on the part of both the carmen and the public which, although frequently present, are

more numerous than any other class. Street car passengers insist on freedom of entrance and exit and rebel against forcible restriction. If people would not get on or off a car while it is in motion our work would be greatly lessened, but that is just what they will do despite our many efforts to warn them, and in their rashness and haste they are all too frequently assisted by the too impetuous conductor or motorman.

Where the summer car is so much used, both summer and winter on this coast, and where doors, gates and folding steps are not provided, an answer must be given to (one foot on the step and the car started)—"Why did you not

warning was not heard the fact that it had been given would be susceptible of proof by others as to the actual occurrence.

"Was the whistle blown before the accident?" and "Was the door opened before the car came to an actual stop?" are recurrent questions which indicate that we must protect ourselves from ourselves; that we must equip our carmen, both mentally and mechanically, by lectures and actual tests in the proper use of safety devices so as to make it difficult for accidents to occur. But we must not overburden the men who have already "too much to do," as they, as well as the public, chafe under the yoke of restriction.

Our work of protection should include the "higher ups" as well as the men, the principles of the doctrine of public safety being preached constantly to the superintendents.

The foregoing is an abstract of a paper read at the Pacific Claim Agents' Association's convention at Los Angeles, Cal., recently.

Inside Hung Brake Rigging on Hull Electric Company's Cars.

The brake rigging of the Hull Electric Co.'s cars, which operate between Ottawa and Aylmer, Que., has been considerably altered from the form it takes on leaving the car works. The outside hung rigging so generally used, was found by this company to be rather cumbersome, constantly becoming clogged up in rough weather from its exposed position outside of the wheels. An inside position was deemed preferable, with the result that the inside hung brake rigging shown in the accompanying illustrations was designed. Several of the company's cars have had this new rigging applied, and it is reported that the results attending their use have been most satisfactory, both from an operation and a maintenance standpoint.

The construction, which is much simpler than that of the outside hung type, consists of a very few simple parts, and is clearly outlined in the line illustration.

Inside Hung Brake Rigging on Hull Electric Co.'s Cars.

preventable and for which we must find a cure without recommending quack remedies. Success has attended our efforts in the educational field, such as "barn" talks to the men, addresses to school children, warnings to passengers by placards and press notices, etc., but our experience teaches us that some measure of physical restraint is also necessary to protect ourselves and the thoughtless or heedless. Already we have minimized the attacks of our adversary, as is shown by a constantly decreasing casualty list.

While it is true that public safety must be recognized as of primary importance, it is also true that attention must be paid to certain economics of car building to prevent the car being equipped with safety devices to such an extent as to make both operator and car in danger of being overburdened by a bundle of mechanical absurdities.

Well directed efforts have been made to so construct the car itself that, structurally, it will conduce to public safety, and these attempts have brought forward many types of cars, each having its own champions. Steam railways have almost universally accepted a standard car pattern and perfection in this line appears to have been about reached, but we yet await the perfectly constructed street car. Is the standard street car an impossibility? Will the time never come when the man on the street will be as familiar with the structure and safety equipment of a car in Los Angeles as in New York or elsewhere? The provision of such a standard car would be a very desirable factor, as in its construction could be embodied the results of our concentrated endeavors for the prevention of accidents.

The more serious accidents happen at the front end, where they are most difficult to prevent, the time for action being but a brief moment, and the danger occasioned by a cause beyond the control of the motorman. Here we must endeavor to lessen the severity of the impact and prevent mutilation.

The accidents at the rear end are

tell me the car was about to start?"—and similar queries. The writer suggests the installation of an electric bell, operated by either the motorman or conductor by means of a push button and ringing simultaneously at the front and rear of the car, at the points of entrance and exit. This would serve to warn passengers and also provide for the "proceed" or "stop" signal to the motorman. By this means the motorman could signal the approach of a passing car and

Inside Hung Brake Rigging on Hull Electric Co.'s Cars.

provision is made for warning those waiting to board a car which is already overloaded as well as the person who approaches the car unobserved from side or rear, as is frequently the case, after the "proceed" signal has been given. With such a system of warnings carried out, parties knowingly assuming the risk of accident would be the authors of their own misfortune in case of mishap. Even in the event of the allegation by the injured person that the

Western Canada Power Co.—W. McNeill, Assistant Manager, W.C.P. Co., stated at a public meeting in Burnaby, B.C., July 16, that contingent upon certain negotiations in progress with the Provincial Government, the company would start construction upon the projected electric railway through North Burnaby by the fall. The matter under discussion was as to the cost of the bridge across the Pitt River, and a decision was expected by the end of August.

Electric Railway Projects, Construction, Betterments, Etc.

Berlin and Northern Ry.—The Berlin, Ont., city council has under consideration a proposal to contribute \$6,000 towards the erection of a new bridge across the Grand River at Bloomingdale, on the projected extension of the old Berlin and Bridgeport Electric Ry. from Berlin to Bloomingdale. W. H. Breithaupt, Berlin, Ont., is President. (June, pg. 308.)

Brandon, Man.—Certain of the aldermen desire that no double track lines be built at present, but single lines only, so as to serve a greater area. The routes at present proposed with double track on Tenth St., are under construction, and the city engineer wants a decision to be reached so that he may go on with track-laying and have the lines in operation at the earliest possible date.

The city engineer has been authorized by the city council to order 100 tons of 70 lb. rails, and 500 tons of 60 lb. rails. (July, pg. 367.)

British Columbia Electric Ry.—R. H. Sperling, General Manager, in an interview, July 5, is quoted as stating that the company is quite willing to reopen negotiations with the transportation committee of Greater Vancouver, in respect to its various franchises. The company will not withdraw any of the offers it had made, and on the other hand, it has no further proposals to make either to Vancouver or the several other municipalities interested. A good deal will depend on the decision of the Imperial Privy Council in the appeal on the Point Grey franchise question, which it was expected would be given in November.

Track has been laid on the Highland Park cutoff to near Edmonds, and the whole line is expected to be ready in the fall.

Plans are being prepared for the erection of car barns on the Kitsilano reserve, and for the erection of additions to the shops in New Westminster. (July, pg. 367.)

Hamilton, Waterloo and Guelph Ry.—The Hamilton, Ont., city council passed a resolution, July 2, granting an extension to Oct. 1, of the franchise for this line, held by J. Patterson. At a meeting of the board of control June 30, Mr. Patterson and the company's engineers were present. It is estimated that the lines which the company proposes to build under its charter, which includes a line to Toronto, will cost \$12,000,000, although it is possible this might be reduced to \$9,000,000 through savings on the right of way. It is desired that local interests should subscribe one-third of the capital. The extension of time was given to see what could be done in this direction. The International Bond and Share Co. of New York, is looking after the financing, and the McArthur Construction Co., of New York, made the estimates for construction. A subsequent press report states that the International Bond and Share Co.'s representative who went to England in connection with the project says the required capital cannot be obtained there. (June, pg. 308.)

International Ry. (British Columbia).—Application is being made by the company for a license to store 5,000 ft. of water in the Fraser River above Yale, B.C., for power purposes. The company contemplates building an electric line through the lower mainland connecting New Westminster with Ladner, thence through Delta and Surrey, B.C., to Blaine, and Huntingdon, Wash. H. T. Thrift, Hazelmere, B.C., is Secretary. (May, pg. 251.)

Lake Erie and Northern Ry.—A bylaw to subscribe \$125,000 of debenture stock in the company was approved by Brantford, Ont., ratepayers, June 25. On July 9, the ratepayers of Simcoe and Port Dover approved of bylaws subscribing \$25,000 each to the project, and July 11,

the Galt town council decided to submit a bylaw subscribing for a similar amount. The town of Paris has also a similar bylaw under consideration.

W. P. Kellett, Managing Director, is quoted as stating that tenders will be asked for the construction of the line early in Aug. (July, pg. 367.)

Lethbridge Municipal Ry.—H. Doughty is quoted as saying that nine miles of track had been laid on the municipal electric railway in Lethbridge, Alta., to July 1, and that it was expected to have the tracklaying completed by Aug. 1. Superintendent Reid returned from the United States, July 10, from a trip purchasing machinery, etc., for the line, and it is hoped to have the line in operation by Aug. 31. (June, pg. 310.)

London and Lake Erie Ry. and Transportation Co.—Representatives of the Yarmouth, Malahide, Aylmer and St. Thomas municipalities have agreed to submit bylaws to provide for guaranteeing the company's bonds for \$15,000 a mile for the 10 miles of line between St. Thomas and Aylmer, Ont., on condition that the line will be extended to Port Burwell within three years. Aylmer, however, limits its guarantee at present to \$25,000. (July, pg. 367.)

London St. Ry.—Work is reported to have been started on the new north end line, which it is expected to have in operation by Jan. 1, 1913.

AN ELECTRIC RAILWAY EXPERT'S VIEW.

J. E. Hutcheson, who has been appointed General Manager, Montreal Tramways Co., has been a subscriber to this paper for a number of years, so that his opinion in regard to it is of interest and value. It is clearly expressed in the following letter:—
"I wish to say that I have found The Railway and Marine World the most useful periodical published in the interests of the railway business. The reading matter is live and very interesting, and is so arranged as to make the paper a very valuable advertising medium. Railway officials who cannot find time to read your monthly are missing something. I wish you continued success."

Montreal and Southern Counties Ry.—The Minister of Railways has approved of the route map for the proposed line from Ranelagh to Laprairie, Que., four miles.

Press reports state that location surveys for the line to Granby have been completed and that it is expected construction will be started at an early date.

A contract is reported to have been let to the Canadian Westinghouse Co., for electrical equipment for the new power house, including three 500 kw. rotaries, six-phase, 60 cycle, 900 r.p.m., 600 volts d.c.; one 400 kw. motor generator set, 720 revolutions, generator 600 volts, motor 2300 volts; the necessary transformers, and ten quadruple 50 h.p. motor car equipments, with multiple unit electric pneumatic control for operating cars. (July, pg. 367.)

Montreal Tramways Co.—Press reports state that the directors have practically completed their plans for the improvement and extension of the various lines. The plans are said to include the building of a second track on the Bout de l'Île line, and a number of extensions out of the city, and particularly to the summer resorts along Lake St. Louis. (June, pg. 309.)

Moose Jaw Electric Ry.—Work was started July 1, on the extension to the proposed park. President Dion in notifying the city council of the extension, said: "This is the only extension that has been

decided upon, and if the statements are made that we are building extensions in other directions they are not authorized by us, and are not correct." (July, pg. 368.)

Niagara, St. Catharines and Toronto Ry.—It is expected that the projected line from St. Catharines, Ont., to Niagara on the Lake, about 14 miles, will be gone on with at an early date, and that it may be completed this year. The Minister of Railways has approved of the route map. The line will branch off from the present line at Niagara St., St. Catharines, and proceed along that street to Carlton St., turning north about half way to the projected line of the new Welland canal, and proceeding as far as the Lake Shore road, about a mile inland, which will be followed to Fort Mississauga, and thence to the wharf, at Niagara on the Lake. The plan also shows a spur line along Carlton St. to lock 2, and a branch to the proposed new port at the Lake Ontario entrance of the new Welland canal.

The Minister of Railways has approved of a route map of a line from near Port Dalhousie to Beamsville, Ont., about 12 miles, but it is hardly likely that it will be built this year. The map shows a line branching off from the present line, where it strikes east along the main road into Port Dalhousie, and proceeding in the opposite direction skirting the lake shore to Jordan, thence striking directly across to Beamsville, where connection would be made with the Hamilton, Grimsby and Beamsville Electric Ry.

Niagara, Welland and Lake Erie Ry.—C. J. Laughlin, General Manager, Welland, Ont., is quoted as stating that the company will have a line in operation by the end of the summer along the east side of the canal from Welland to Port Colborne, Ont. (July, pg. 368.)

Nipissing Central Ry.—The Minister of Railways has approved of a route map for the extension of the line from Haileybury to New Liskeard, Ont., 5.5 miles. (June, pg. 359.)

Ottawa, Rideau Lakes and Kingston Ry.—T. R. Clougher, London, Eng., and H. E. Upson, Ottawa, made an inspection of the route of this projected railway from Ottawa to Kingston, Ont., early in July. Mr. Clougher is quoted as stating that with the exception of 20 miles at the Kingston end the line would be an easy one to build and that the company was arranging for the financing of the line, and that he expected construction would be started early in 1913. (June, pg. 309.)

Port Arthur and Fort William Electric Ry.—The utilities committee of the Port Arthur, Ont., city council, had the city engineer's plans for the projected belt line to connect with the main line and the Arthur St. extension in that city, before it, July 5. The committee recommended the council to approve of the same, and to prepare a necessary bylaw for submission. The route recommended was not made public. (July, pg. 368.)

Regina Municipal Ry.—The Regina, Sask., city council has under consideration a proposition from a group of real estate men who offer to build a six mile line to open up new territory, and hand it over to the city. The council has asked the promoters to submit proposals for the operation and maintenance of the line pending the development of the property.

Considerable damage was done to the overhead work, and to the car barns, etc., by the cyclone which struck the city on June 30. (April, pg. 197.)

St. Thomas St. Ry.—The city engineer has been directed by the St. Thomas, Ont., city council to prepare an estimate for extending the city's electric railway from Hemlock St. to Pinafore Park, and for putting the track now laid in the park in a condition for traffic. (July, pg. 368.)

Sarnia St. Ry.—Owing to a fire at the plant of the Sarnia Electric Light Co.,

June 28, the street railway service had to be suspended. The S.S. Ry. secured a generator and a steam engine from the Detroit United Ry., and was able to resume its car service July 10. (April, pg. 197.)

Saskatoon, Sask.—Only one vote was cast recently against the project to build an electric railway in Saskatoon, Sask., as a municipal enterprise. The bylaw authorizes the expenditure of \$500,000 on the line, and the routes to be followed are to be practically the same as those laid out by H. M. E. Evans, under the charter given the Saskatoon Electric Ry. and Power Co., which was abandoned. The financing is being arranged through Stone and Webster, Boston, Mass., the construction being in charge of city engineer Locke, with O. A. McCormick, formerly general foreman of construction on the electric railway at Seattle, Wash. Construction was started July 1, and it is expected to have the first section of the line in operation by Nov. 15. (June, pg. 310.)

Toronto and York Radial Ry.—The order authorizing the diversion of the Metropolitan Division to a private right of way from Farnham Ave. to a new terminal near the C.P.R. tracks, North Toronto, was issued June 26; and the company started clearing part of the site July 1. The city has notified the company of its intention to appeal against the order, and this will be dealt with when the courts resume in September.

The taxpayers voted against a bylaw to permit the double tracking of the line on Yonge St., within North Toronto municipality, and in favor of the bylaw to merge the municipality in the city of Toronto. (July, pg., 368.)

Toronto Eastern Ry.—The Board of Railway Commissioners has approved of revised location plans for the line through Pickering tp. Ont.

This line is under construction from Bowmanville to Toronto, together with a branch line into the town of Oshawa, Ont. The general contractor is Gowan Mackenzie, Toronto, who has sublet the grading to the following: Wm. Yule, Bowmanville; Victoria Construction Co., Toronto; Robert Hill, Oshawa; E. Cook, Oshawa; and C. H. Cook, Whitby. The contract for fencing has been let. (July, pg. 368.)

Toronto Suburban Ry.—The first of the extensions of this line to be placed under construction is that from Weston to Woodbridge, Ont. The location is along private right of way, and the contract is being carried out by Ewen Mackenzie, Toronto. The general contractor's own outfit is working on a section of the line, and the grading on the balance has been sublet to S. O'Connor, Woodbridge, and W. Joplin, Woodbridge. The fencing contract has also been let. About half the grading has been completed, and it is expected to have the work completed early in September.

The line to Guelph is also under construction, the general contract having been let to Ewen Mackenzie, Toronto. This line is being built on a private right of way, and starts from the present Lambton line in the park there. It will cross the Humber River a little south of the C.P.R. bridge. The bridge to be built there will be large enough to be also used by the Canadian Northern Ry. line to Niagara Falls. The location from this point is parallel with Dundas St., partly on the north and partly on the south, through Islington, and Summerville, going down to the C.P.R. tracks just west of Dixie station, and keeping alongside of the C.P.R. as far as Cooksville station, where it turns northerly, and proceeds in nearly a straight line for Meadowville, thence through Churchville, Huttonville and Norval to Georgetown. Thence it parallels the G.T.R. to Acton and runs in a nearly direct line to Guelph, passing through Eden Mills. The exact location

for the entrance into Guelph has not been decided. Surveys are being made for an extension from Guelph to Berlin, and it is intended later on to proceed with the surveys to Stratford, which city has given the Mackenzie, Mann & Co. interests a franchise under the charter of the Stratford Ry. The contract let to Ewen Mackenzie, covers the line to Guelph, and it is expected to have it completed this year. A sub-contract for grading on the eastern portion of the line has been let to W. Maher, West Toronto, and other grading sub contracts are being arranged. E. T. Wilkie, is Chief Engineer.

The Ontario Railway and Municipal Board has ordered the company to reconstruct the line on Bathurst St., and Davenport Road, and to pave between the tracks and for 18 ins. on either side, the work to be done under the supervision of the Board's engineer. (July, pg. 368.)

Winnipeg Electric Ry.—A permit has been granted for the erection of a 14 story building to cost \$500,000, on the corner of Notre Dame and Albert streets, Winnipeg. Pratt and Ross are the architects, and the contract has been let to the Carter, Halls, Adlinger Co., Winnipeg. (June, pg. 310.)

Electric Railway Finance, Meetings, Etc.

British Columbia Electric Ry.—Gross earnings for May, \$491,826; operating expenses \$313,469; net operating earnings \$178,357; renewal funds \$37,935; net earnings \$140,422; approximate income from investments \$25,000; net income \$165,422, against \$398,437 gross earnings; \$260,437 operating expenses; \$138,000 net operating earnings; \$29,770 renewal funds; \$108,230 net earnings; \$20,000 approximate income from investments; \$128,230 net income for May 1911. Aggregate gross earnings for 11 months ended May 31, \$5,251,843; aggregate net earnings including estimated income from investments, \$1,836,830, against \$3,839,170 gross and \$1,464,709 net for same period 1910-11.

Brantford St. Ry.—The National Trust Co. sued the Brantford St. Ry. Co. recently to recover \$125,000 and foreclosure of mortgaged premises in default. In the Trial Court at Toronto, July 18, Judge Kelly gave the following decision:—"On the opening of the trial, it was shown that on June 11, the defendant had paid to plaintiff all arrears of interest, and an undertaking satisfactory to plaintiff was given for payment of plaintiff's costs up to the time of such payment. A breach of the covenants did not entitle plaintiff to possession, or to have a receiver appointed. Their remedy is on the covenants themselves. Action dismissed with costs from the time of payment of the interest on June 11, the plaintiff being entitled to costs to that time."

Calgary Municipal Ry.—Passenger earnings for June, \$54,318.77; miscellaneous earnings, \$589.26; total earnings, \$54,908.03; operating expenses, maintenance, etc., \$32,058.38; net operating earnings, \$22,849.65; contingent fund, interest, etc., \$8,008.73; net profit, \$14,840.92 against \$31,526.35, passenger earnings; \$844.60 miscellaneous earnings; \$32,370.95 total earnings; \$13,742.95, operating expenses, maintenance, etc.; \$18,628 net operating earnings; \$4,334.43, contingent fund, interest, etc.; \$14,293.57, net profit for June 1911. Following are the operating statistics for June, revenue per car mile, 32.660c.; operating expenses per car mile 18.906c.; surplus per car mile 13.754c.; cost of power per car mile 4.570c.; proportion of expenses to revenue 58.3%.

Cape Breton Electric Co.—Gross earnings for May, \$28,577.95; operating expenses and taxes, \$16,192.34; net earnings, \$12,385.61; interest charges, \$4,495.83; balance, \$7,889.78; sinking and improvement funds, \$1,206.66; balance for

reserve, etc., \$6,683.12, against \$27,650.50, gross earnings; \$15,471.54, operating expenses and taxes; \$12,178.96 net earnings; \$4,512.50 interest charges; \$7,666.46 balance; \$1,141.67 sinking and improvement funds; \$6,524.79 balance for reserves, etc., for May, 1911.

Edmonton Radial Ry.—Revenue for April, \$32,158, against \$19,014 for April 1911. The number of passengers carried during April was 782,646, against 452,959 in April 1911.

London St. Ry.—Gross earnings, \$25,755.40; expenses, \$17,752.26; net earnings, \$8,003.14; deductions, \$2,371.25; net income, \$5,631.89, against \$24,501.91 gross earnings; \$16,841.63 expenses; \$7,210.28 net earnings; \$2,375.49 deductions; \$4,834.79 net income, for June 1911. Aggregate gross earnings for six months ended June 30, \$141,809.05; expenses \$101,502.05; net earnings \$40,307; deductions \$14,368.50; net income \$25,938.50, against \$127,801.83 aggregate gross earnings; \$94,193.01 expenses; \$33,608.82 net earnings; \$14,269.34 deductions; \$19,339.48 net income for same period 1911.

Moose Jaw Electric Ry.—The gross revenue for the first six months of operation, Sept. 4, 1911, to Feb. 29, is reported as \$16,205, with an expenditure of \$12,479. A meeting of shareholders was held at Moose Jaw, July 3, when it was decided to increase the capital stock to \$1,000,000.

Nelson St. Ry.—Replying to the offer of the Nelson, B.C., city council, to give par for the stock of the company, payable without interest in twenty annual instalments, the company showed a disposition to accept the price, but asked for 3% on the deferred payments. At a subsequent meeting of the city council, an offer was made of \$7,500 for the property and assets of the company to quote the words of the mavor, "lock, stock and barrel" in presenting the resolution.

Toronto Ry., Toronto and York Radial Ry., Toronto Power Co., and allied companies.—Gross earnings for May, \$693,015; operating expenses, maintenance, etc., \$342,545; net earnings \$350,470, against \$622,197 gross earnings; \$304,378 operating expenses, maintenance, etc.; \$317,819 net earnings, for May 1911. Aggregate gross earnings for five months ended May 31, \$3,315,738; net earnings, \$1,696,457, against \$2,934,018 aggregate gross earnings; \$1,471,281 net earnings, for same period 1911.

The gross receipts of the Toronto Ry. for June, were \$444,598.91 against \$401,185.88 in June 1911. The percentage paid to the city for June, was \$88,919.70.

Winnipeg Electric Ry.—Gross earnings for May, \$298,743; operating expenses, \$162,364; net earnings, \$136,379, against \$295,779 gross earnings; \$149,699 operating expenses; \$146,080 net earnings, for May 1911. Aggregate gross earnings for five months ended May 31, \$1,508,300; net earnings \$690,817, against \$1,576,252 aggregate gross earnings; \$761,488 net earnings, for same period, 1911.

Scenic Railway at Vancouver.—A new plan for the construction of a scenic railway up Grouse Mountain was submitted to the North Vancouver municipal council, July 8. A. Phillip proposes the building of a cable line from the end of the proposed extension of the B.C. Electric Ry. line to Essex St., up the mountain side. The first section of the proposed line would have a gradient of 15% and the second section a gradient of 28%, as against the 50% gradient proposed in the plan of the Grouse Mountain Scenic Ry., which was under consideration early in 1911. As no right of way would have to be acquired, the cost would be light, the preliminary estimate being \$50,000. Power would be obtained from the B.C. Electric Ry. The council appointed a committee to interview the promoters, the B.C. Electric Ry. officials and the district council.

Marine Department

Accident to Gates of Lock 22, Welland Canal, Near Thorold, Ont.

By Emile Low.

One of the most serious accidents in the history of the Welland Canal occurred on June 20, about 3.30 p.m. at Lock 22, near Thorold, Ont., when the Canadian Government survey steamboat, *La Canadienne*, bound up from Lake Ontario to Lake Erie, and just entering the lock, ran into the upper gates and opened them. The subsequent rush of water dismantled both the upper and lower

22.7 ft., depth 10.9 ft. She had just passed out of lock 21, some 800 ft. below, and was entering lock 22. The lower gates of this lock were open, and were within the gate recesses, being held in place by the automatic gate hook. Along the lock walls are concrete snubbing posts; every vessel passing through the lock must have two men to attend to the snubbing line, one end being made fast to the ves-

also were torn from their fastenings and followed the vessel and upper gates into the canal below.

The boys who were drowned by the wave of water, had been playing on the bank of the equalizing basin to the left of the canal just below lock 22. Two out of five, succeeded in saving themselves, but three were carried away.

Of the accompanying illustrations, figs.

Fig. 1. Looking Down Stream from Lock 22 to Lock 21. *La Canadienne* stranded on Right Bank.

Fig. 2. View from Waste Weir across Equalizing Basin towards Lock 21

gates, wrecked the steamboat and a number of scows in the canal below, and drowned three boys who were near the canal bank.

The numbering of the canal locks begins with no. 1, at Port Dalhousie, on Lake Ontario, and extends southward to Port Colborne, on Lake Erie. The lock at Port Colborne, no. 26, is a guard lock,

sel or to its capstan forward, and the other end to one of the snubbing posts. It seems that at the time of the accident the lower end of the snubbing line was in place around the snubbing post on the lock wall but its other end had not been securely enough fastened to the vessel, so that it did not hold as the vessel moved forward. The result was that the headway of the vessel was not checked

1 to 3, show the appearance of the canal prism just below lock 22 after the accident. The stranded vessel is lying on the right bank; its side was damaged, possibly by striking the bank, and the vessel sank. At the time the photographs were taken, the canal prism had been emptied, as an aid in finding the bodies of the drowned boys and for recovering the displaced lock gates of lock 22. These

Fig. 3. Lower Gates of Lock 22, Replaced.

and lock 25 is at the northern end of the long Lake Erie lever, which ends a short distance south of Thorold. At the latter point the descent to Lake Ontario begins, skirting the escarpment between the two lakes.

La Canadienne was proceeding up through the canal on an inspection trip from Lake Ontario points to Duluth. She is a steel vessel, length 154.3 ft., breadth

Fig. 6. Gowan Safety Appliance on a Lock Gate.

and she struck the left hand leaf of the upper gate, opening the gate and allowing the water of the upper level to pour into the empty lock chamber.

The in rushing water lifted the upper gates off their sockets and carried them with the vessel into the canal below the lock. At the same time, the holding mechanism of the lower gates, being too weak for the rushing water, these gates

gates are seen lying on the banks in fig. 1, while in fig. 3, the lower gates are shown after they were put back in place, one of the upper gates still lying on the canal bank in the foreground. The sketch plan, fig. 4, exhibits the locality.

A device for minimizing the risk of accident in case of boats striking the lock gates has been installed at lock 24, and is being fitted to lock 21. This is the Gowan

lock gate safety appliance. It is sketched diagrammatically in fig. 5, where its action when a boat strikes one leaf of the gate is represented; fig. 6 shows it applied to a lock gate. The device consists of two large horn castings, one on each gate-leaf, each having the face abutting against the other leaf, shaped to the arc of motion of that leaf. When one leaf is pushed back, the other leaf would, without this device, be forced down stream by the water pressure, and lack-

Fig. 5. Gowan Lock Gate Safety Appliance as fitted to a pair of Lock Gates.

ing the abutting pressure of the miter the leaf would be wrecked. The safety device prevents such action in case of small motions, and guides the leaves back to proper miter. It also helps to secure true mitering whenever the gates are closed.—Engineering News.

Canadian Railway and Marine World is indebted to W. H. Sullivan, Superintending Engineer, Welland Canal, for the photographs from which the accompanying illustrations were made.

New Plant Line Steamship for Halifax and Boston Service.

The Canada Atlantic and Plant Steamship Co.'s s.s. *Evangeline* was launched at Govan, Scotland, July 4, the christening being performed by Mrs. H. L. Chipman, wife of the Eastern Manager of the company, Halifax, N.S.

The vessel has 260 state rooms in addition to other cabins, and altogether has accommodation for 700 passengers, and crew of 95. There is also capacity for 1,500 tons of cargo. On the navigating bridge are situated the chart and wheel house, captain's and officers' quarters, wireless telegraph office, etc. The boat, or promenade deck extends practically the length of the vessel, and is occupied by the smoke room, entrance hall, 50 staterooms opening direct on deck, etc. The awning deck is devoted entirely to passenger accommodation, music room and state rooms de luxe. The dining saloon is on the main deck forward of the grand stairway, and is 60 by 45 ft., and aft of the dining saloon are 80 staterooms de luxe. On the lower deck are 20 family staterooms, and a ladies' cabin with 50 berths, and forward are the men's second class cabins and crew's quarters, while the kitchen, etc., are located amidships.

Special attention has been paid to ventilation, and also to heating; each stateroom is equipped with separate radiator under the control of the occupant, and the principal rooms are fitted with telephones connecting with the stewards' department. All the latest improvements in boats, life belts and other life saving appliances are supplied, also complete fire extinguishing plant, Kelvin's sounding machine, and Marconi wireless telegraph.

Her dimensions are, length over all, 364 ft., breadth 46 ft., depth moulded to main deck 33 ft. She is built entirely of steel to Lloyds 100 A1, with double bottom and six water tight compartments, and with ballast tanks carrying 450 tons of water, with specially built bilge keels 200 ft. long to give stability and

steadiness. The machinery consists of twin engines and six boilers, 6,000 h.p., capable of developing a speed of 18 knots. The engines are of the reciprocating four crank cylinder triple expansion type, and the boilers are equipped with forced draught.

The vessel should have been launched in April, but considerable delay occurred owing to strike troubles.

Completion of the Richelieu and Ontario Navigation Co.'s Absorptions.

The absorption of lake lines, which the Richelieu and Ontario Navigation Co. had in view, was completed July 18, when the capital stock of the Inland Lines was transferred to the R. and O. N. Co., payment therefor being made, it is said, in R. and O. N. stock.

The Inland Lines Ltd., has headquarters at Hamilton, Ont., the officers being Jas. Playfair, President; J. P. Steedman, Vice President, and J. I. Hobson, Treasurer. It operates the following vessels on the Great Lakes: Donnacona, Dunelm, Dundee, Dundurn, Emperor, Empress of Fort William, Empress of Midland, Glenellah, Neepawah, Rosedale, Stadacona, Strathcona, Midland King, Midland Prince, Midland Queen, Wahcondah, Winona. Of these, all but the Dundurn are freight vessels.

The absorption of the Inland Lines gives the R. and O. N. Co. a combined fleet of 71 vessels, as follows:— R. and O. N. Co., 13 steamboats and 18 market line steamboats; Niagara Navigation Co., (including acquired from Hamilton Steamboat Co., and Turbine Steamship Co.), 8 steamboats; St. Lawrence Steamboat Co., 3 steamboats; Thousand Islands Steamboat Co., 3 steamboats; Inland Lines, Ltd., 17 steamboats.

Atlantic and Pacific Ocean Marine.

The Cunard Steamship Co. has arranged that its vessels on the Canadian route shall make Plymouth one of the English ports of call. The s.s. *Ascania*, which arrived at Plymouth from Montreal and Quebec, early in July, was the first vessel on the new schedule.

The Allan Line steamships at present under construction in Great Britain, and

The Dominion Government has called for tenders for the construction of a powerful iron cruiser for the Customs service in the St. Lawrence Gulf. She is to be 185 ft. long, 32 ft. beam, with a draught of 10½ ft., and is to be fitted with 2,000 h.p. engines, and armed with two 26 lb. quick firing guns, in addition to the ram at the bow. She will carry 32 officers and men. She will be constructed with water tight bulkheads.

The C.P.R. s.s. *Empress of China*, which was wrecked on the Shirahama reef, off Japan, July 26, 1911, is reported to have been sold to a copper and iron dealer in Yokohama for \$65,500, for breaking up. After the vessel was floated and touched up, at Nagasaki, it was expected that she might have been repaired sufficiently to enable her to be taken to England for complete repairs, but this project had to be abandoned.

Sir Montagu Allan, who was visiting in Winnipeg, early in July, is reported to have stated in an interview, that navigation on Hudson Bay, was no less practical than it was at one time on the St. Lawrence. The one drawback he saw in the inauguration of such traffic on Hudson Bay, was that no insurance company would take the risk without rates that would be practically prohibitive, but he considered that it was a place for government enterprise.

It is reported in New Westminster that the British Columbia Transport Co. is being organized to operate a freight steamship service between New Westminster and Great Britain, via Panama, on the opening of the canal. E. J. Fader, New Westminster, is interested in the scheme, which is connected with the proposal to form a British company with a capital of £250,000 and a British Columbia charter, for the operation of a steamship service between New Westminster and Victoria, and elsewhere, as mentioned in our last issue.

The Dominion Minister of Marine, in discussing the question of insurance rates on Canadian shipping, in London, Eng., recently, is reported to have said that undoubtedly a very strong sentiment exists in Canada for the establishment of either a Canadian Lloyds, or a Government system of insurance, and that in his opinion, there was unjust discrimination against Canada on the part of Lloyds, which is entirely unwarranted either by the topography of the Atlantic coast or

Fig. 4. Sketch Plan of Vicinity of Lock 22.

which will be ready for placing in service in the spring, are to be named *Alsatian* and *Calgarian*. They will each be about 18,000 tons gross, with a speed of 18½ to 20 knots. It is reported that the company has acquired an additional 1,500 ft. of water front at Quebec, to provide extra accommodation for its vessels.

Lord Strathcona, who presided at the Dominion Day dinner in London, Eng., July 1, said that there were three or four questions of paramount importance to the different parts of the Empire, the first was that of communications. He said that there were not yet, steamships of from 22 to 25 knots capacity passing between Canada and British ports, but he still hoped to see the trip done in four and a half days.

by the statistics of wrecks. He believed that it would not be long before one or the other of these policies would be adopted.

Maritime Provinces and Newfoundland.

The Department of Public Works has received tenders for the construction of a sea wall at Windsor, N.S., and a wharf at Boisdale, N.S.

The Department of Public Works received tenders, July 24, for the construction of a breakwater at Seaforth, N.S., and for an extension to the breakwater at Somerville, N.B.

The harbor development construction work at Courtenay Bay, St. John, N.B., was inaugurated, July 11, by the Minister of Finance, who by an electric connection exploded a charge of dynamite, blowing up a portion of a hill which has to be removed.

The final report of the St. John River Commission is expected to be filed by Aug. 15. The whole river has been surveyed, and the report contains estimates of the possible amount of storage both for lumbering and power purposes. S. J. Chapleau represented the Dominion Public Works Department.

An order in council has been passed abrogating an order in council of Apr. 10, which confirmed the bylaws relating to the employment of pilots and the equipment of pilot boats, passed by the pilotage authority of St. John, N.B., as information has been furnished that they require further consideration.

The St. John, N.B., schooner Abana, which was wrecked in West Quoddy Bay, Lubec, Me., Sept. 2, 1911, condemned as a total loss, and sold for the benefit of those concerned, has been rebuilt, and permission has been granted to have her re-registered under her old name, no. 96945, at the port of St. John, as before.

At the recent investigation into the cause of the stranding of the Magdalen Islands Steamship Co.'s s.s. Amelia at Boars Head, in the Bay of Fundy, on June 7, before Capt. W. R. Luger, Assistant Wreck Commissioner, the captain, W. W. Hersey, was found guilty of negligence, and his certificate was suspended for three months. He was given permission to act as mate of a passenger vessel during that time.

The Dominion Public Works Department has under construction at Polson Iron Works, Toronto, a single screw sea-going tug, with hull of steel throughout. The machinery will consist of main engines, surface condensing type with cylinders 12 and 26 ins. diam., by 18 ins. stroke, supplied with steam at 145 lbs. working pressure, by a boiler of the Scotch return tubular type, 10 ft. diam., by 11 ft. long. She will be equipped with electric light plant, search light, steam steering gear and steam windlass. Her dimensions are, length 80 ft., beam, moulded, 20 ft., depth, moulded, 10 ft.

Province of Quebec Marine.

The Marine Department has decided on the construction of two steel steam tug boats at the Sorel yards, for use in connection with the dredges, now under construction for the St. Lawrence service.

The Quebec Transportation and Forwarding Co., launched a steam tug, named Margaret A. Hackett, from its plant on the St. Charles River, July 16. She is built of white oak, and is 115 ft. long, 24 ft. wide and 10½ ft. deep.

At a meeting of the Quebec Harbor Commission, July 15, it was decided to proceed with the improvements to the Commission's elevator, which is operated under lease by J. Richardson and Sons, Kingston. The improvements include the addition of a marine leg, and the expenditure will be about \$25,000.

During June, permits to pass through the Lachine canal were issued to 1,587 vessels. The quantity of wheat passing through in June, was 3,636,788 bush., oats, 1,644,799 bush.; flax, 124,541 bush.; flour, sacks, 90,677; eggs, cases, 4,545; butter, pkgs., 1,438; cheese, boxes, 50,329; coal, tons, 54,085; coal landed on canal banks, tons, 56,214.

The Montreal Dry Dock and Ship Repairing Co., Ltd., was recently incorporated, with \$50,000 capital, and office at Montreal, to operate the Tate dry dock, on the Lachine canal, of which it has obtained a ten years lease. The officers are, President, J. T. Walsh; Vice President, A. Larocque; Managing Director, T. Hall; Secretary-Treasurer, F. H. Fox.

La Compagnie de Navigation Canada's s.s. Florida was burnt at the Victoria pier, Montreal, July 7, and became, with her cargo, a total loss. She was operated between Montreal and points on the Richelieu River. She was built at St. Thomas de Pierreville, Que., in 1900, and was screw driven by engine of 5 n.h.p. Her dimensions were, length, 100 ft., breadth, 18.7 ft., depth, 5.8 ft.; tonnage, 201 gross, 128 register.

The floating dry dock, which is under construction, for Montreal at Barrow-in-Furness, Eng., was launched July 22, and christened "Duke of Connaught," by Mrs. Hazen, wife of the Dominion Minister of Marine. C. C. Ballantyne, one of the Montreal Harbor Commissioners, was present at the launching. For the reception of the dry dock at Montreal, 30 acres of land have been reclaimed at Maisonneuve, and the permanent basin walls and approach channels have been almost completed. The dock is to have a lifting capacity of 25,000 tons, and is made in three sections, so that three smaller vessels can be docked at the same time.

In response to the Dominion Government's request for proposals for the construction and operation of a dry dock and shipbuilding plant for Quebec, the site for which has been selected at St. Joseph de Levis, it is stated that no proposals, on the plans outlined by the Government, have been received, but that one tender for the construction of the dry dock alone, has been received. The tender is by Sir John Jackson and Sons, Ltd., of England and Montreal for about \$2,500,000, the dock to be handed over to the Government on completion, for operation.

The Ontario and Quebec Navigation Co.'s s.s. Geronia, which sailed from Toronto, July 11, for Quebec, struck a rock in the Lachine Rapids, July 13, and was beached near Heron Island. The passengers were removed by the Verdun-La Tortue ferry steamboat St. Louis, and landed at Montreal. The Geronia was

Ontario and the Great Lakes.

The Canadian Interlake Line has received the steamboat Hamiltonian from the builders, and has placed her in service. She is full Welland canal size.

An Ottawa press dispatch states that a contract has been let to M. J. Hogan, for \$213,000 to extend the pier at Port Colborne, Ont., to provide additional docking facilities.

The lake freighter Toiler, passed through the Welland Canal, July 15, with 101,000 bush. of grain, which is stated to be the largest single cargo to pass through the canal.

It was reported in Montreal, July 16, that the Richelieu and Ontario Navigation Co. was negotiating for the taking over of Round Island, in the St. Lawrence River, where it would rebuild the Frontenac Hotel.

The East Side Fish Co., Port Stanley, Ont., has ordered a marine outfit, consisting of fore and aft compound engine with cylinders 9 and 18 ins. diam., by 14 ins. stroke, and Fitzgibbon boiler, 60 by 108 ins., from the Polson Iron Works, Toronto.

The Calvin Co.'s steamboat India, while entering the Welland Canal at Port Colborne, July 15, collided with the G.T.R. bridge, damaging her steering gear, and moving the pivots of the bridge. The accident is stated to be due to mistaken signals on the vessel.

Hon. F. D. Monk, Minister of Public Works, is stated in a press dispatch to have said at Sault Ste. Marie on July 19, that he had instructed the engineers to start preparing plans for the construction of a new canal and lock there and to go ahead with preparations for commencing work.

The Niagara Navigation Co.'s steamboat Cayuga, which recently broke three of her propeller blades, had three new ones put on, July 16, by the use of the coffer dam arrangement, designed by B. W. Folger, ex-General Manager, and which was fully described and illustrated in our issues of June and July, 1908.

In the article dealing with the absorption of three more steamboat lines by the Richelieu and Ontario Navigation Co., on pages 369 and 370 of our last issue, the name of W. Hanson, director, was given

Dominion Government Hydrographic Steamship for Atlantic Coast.

For description, see July, pg. 370.

beached with 3 ft. of water at her bow and about 15 ft. at her stern. The Sincennes-McNaughton Co.'s tugs Rival and Natalie R. were put to work on her with the necessary pumps and outfit, and she was floated, July 16, when she was patched, where a large hole had been ripped in her side, after which she was taken to Montreal for examination and repairs.

as W. Manson; and in the last paragraph of the article, the Inland Lines, Ltd., was referred to as the Island Navigation Co.

The Silver-Islet Navigation Co., Ltd., has been incorporated under the Ontario Companies Act, with \$40,000 capital, and head office at Fort William, to conduct a general navigation and elevator business, etc. F. S. Wiley, R. L. F. Strathy, H. J.

Stephens, Port Arthur; J. J. Wells and P. H. B. Dawson, Fort William, are the provisional directors.

J. E. Russell, contractor, Toronto, has ordered from the Polson Iron Works, Toronto, a steel drill boat, for general use on marine contract work. The dimensions are, length, 80 ft., beam 30 ft., depth 6 ft. The boiler will be of the water tube type with steam at 150 lbs. working pressure. The hull and boiler only are being built by the Polson Iron Works.

The Lake Simcoe Navigation Co. Ltd., has been incorporated under the Ontario Companies Act, with \$40,000 capital, and office at Toronto, to own and operate steam and other vessels, and carry on a general ship owning, navigation and transportation business. The incorporators are, R. J. Law, W. G. Simpson, F. C. L. Jones, I. M. Johnston and F. V. Dalton, Toronto.

The small steamboat, Emma, owned by C. E. Pratt, Parry Sound, and utilized in passenger service between Parry Sound, Depot Harbor and Rose Point, was burnt, July 4. She was built in Collingwood, in 1894, and rebuilt at Parry Sound in 1901. Her dimensions were, length, 89.3 ft., breadth 18 ft., depth 6.6 ft.; tonnage, 146 gross, 94 register. She was equipped with engine of 2 n.h.p., driving a screw.

Work on the preparation of the site for the dry dock, to be built in connection with Polson Iron Works, Toronto, was commenced July 16, when the contractor for the pile driving, J. E. Russell, started operations on the foundations for certain special machinery. W. Newman, Works Manager, stated that it was hoped to have one section completed by the fall, and the entire dock ready for the spring.

The Collingwood steamboat Wasaga, which was burnt, and afterwards sank near Copper Harbor on Lake Superior, in Nov. 1910, has been removed under the authority of the U.S. War Department. It is stated that the removal has disclosed an uncharted rock ledge, 375 ft. north, 49 deg. east from the north east corner of the old Booth wharf, covered by 17 ft. of water, with about 20 ft. all round.

It is reported that the Dominion Government is arranging to acquire a site for an elevator at Port Arthur. The property under negotiation is next to the Canadian Northern Ry. elevator, and has 600 ft. frontage. It is also stated that the Port Colborne elevator is to be extended. The present capacity is 800,000 bush, and it is said to be the intention to bring it up to a capacity of 2,000,000 bush.

The Department of Railways and Canals has ordered from the Polson Iron Works, Toronto, a steel ice breaking tug, for use in the Sault Ste. Marie canal. Her dimensions are, length 55 ft., beam 13 ft., depth, 8 ft. 7½ ins. The machinery will consist of high pressure vertical engine with cylinder 12 ins. dia., by 14 ins. stroke, supplied with steam at 150 lbs. pressure, by a Scotch boiler, 7 ft. dia., by 9 ft. long.

F. E. Gibbs and W. D. Staples, members of the Dominion Government grain commission, visited Fort William, July 5, in connection with the proposed Government terminal elevator. Mr. Gibbs, is reported to have said that he was not in a position to make a statement as to the exact location of the elevator, but there was good reason for presuming that it would be erected on the water lots abutting on lot 19. Tenders for the erection of the elevator are being called for.

The U.S. Lake Survey reports the levels of the Great Lakes in feet above tidewater, for June, as follows: Superior, 602.22; Michigan and Huron, 580.48; Erie, 573.64; Ontario 247.34. As compared with the average June levels for the past 10 years, Superior was 0.18 ft. below; Michigan and Huron 0.53 ft. below; Erie, 0.24

ft. below, and Ontario 0.54 ft. above. It was anticipated that during July, Superior would rise 0.2 ft.; Michigan and Huron 0.1 ft.; and that Erie and Ontario would remain stationary.

The Canadian Interlake Line's freighter, Fordonian, which is expected to be in operation on the great lakes shortly, and which has been built at Glasgow, Scotland, is of full canal size, being 257 ft. long, 42½ ft. beam and 26½ ft. deep. She is equipped with a Carels-Diesel engine of the four cylinder, two cycle type, 1,100 h.p. driving a screw. The cooling water is circulated by a pump driven by a steam engine supplied by a donkey boiler equipped with oil burning apparatus, and which also operates the auxiliary appliances. Fuel will be carried to keep the main engine running for 25 days, and it is stated that the builders have guaranteed the vessel for six months regular service.

An investigation into the causes of the accident in the Welland canal at Port Colborne, when the Dominion Government steamboat La Canadienne, broke through the lock gates, June 20, was held at Port Colborne, July 5, before Capt. Lindsay, acting Wreck Commissioner, with Capt. Milligan and Atkinson, Port Colborne, as assessors. The blame for the accident was found to rest on the captain, Alex. Brown, with extenuating circumstances, owing to the fact that little or no assistance was to be had from the crew, who were ignorant of their duties and careless, and that the master's orders were disregarded in the use of the snubbing rope on entering the first lock. The master's certificate will not be interfered with, considering the inefficient manner in which the crew handled the ropes and performed their duties.

Manitoba, Saskatchewan and Alberta.

A meeting was held in Winnipeg, July 17, of members of the board of trade, the harbor commission, city council, and representatives from North Dakota and Minnesota, in connection with the proposals for the improvement of the Red River. The mayor of Winnipeg, as President of the Red River Association, presided, and resolutions were dealt with, urging both the Dominion and U.S. Governments to support the scheme.

The Hudson's Bay Co.'s steamboat, Slave Lake, which was launched at Athabasca Landing, Alta., recently, is of the following dimensions: Length 110 ft., beam 22 ft., depth of hold 4½ ft. She is equipped with engine having a cylinder 9 ins. dia., by 42 ins. stroke, driving a paddle wheel 14 ft. dia. She has been built for freight and passenger service on the Lesser Slave Lake, and her route will be from Salteaux Landing to Grouard. She has accommodation for 22 passengers, and about 50 tons of cargo. The company has another vessel under construction for use on the Athabasca river between Grand Rapids and Mirror Landing. She will be named Athabasca River, and is expected to be ready for service during August. Her dimensions are, length 135 ft., width 28 ft., depth of hold 3½ ft., and she is equipped with engine having cylinders 12 ins. dia., by 50 ins. stroke, driving a stern paddle.

British Columbia and Pacific Coast Marine.

The Public Works Department is calling for tenders for the construction of an extension to the public wharf at Port Moody. The plans cover the erection of a wharf 40 by 64 ft. and an approach from the present wharf of 1656 by 16 ft.

Arrangements are being made for an immediate start on the harbor improvements at New Westminster, for which the ratepayers have voted \$500,000. It is expected that preliminary work will be

so far advanced by September, that the concrete work can then be proceeded with.

The West Vancouver Ferry Co., Ltd., has been incorporated under the B.C. Companies Act, with \$150,000 capital, and office at Vancouver, to carry on a general ferry business, own and operate steam and other vessels, and to carry into effect an agreement with the municipality of West Vancouver.

T. G. McBride and Co., on July 6, placed in service in the Vancouver harbor, a new steam tug named Moonlight. She was built in Vancouver, and has a displacement of 42 tons. The dimensions are, length 70 ft., beam 16½ ft., draught 7 ft. She made nearly 10 miles an hour on her trial trip.

The work on the G.T. Pacific dry dock at Prince Rupert, which was suspended owing to the death of M. Dow, the contractor, has been re-commenced, by Starrett and Co., of Seattle, Wash., and it is stated that the work will be pushed with all speed. The contractors hope to have it completed well within the contract time.

The Inland Navigation Co.'s s.s. Sol Duc, made her maiden trip on the Seattle-Victoria run, July 4. She was launched at Seattle, Wash., towards the end of June. Her dimensions are, length over all, 205 ft., length between perpendiculars, 195 ft., breadth over guards 34.9 ft., breadth moulded 32 ft., depth of hold 12.8 ft., depth moulded 14.3 ft. She has 51 state rooms with berth accommodation for 163 passengers.

In correcting some misstatements which appeared in some London, Eng., daily papers recently, regarding the harbor at Vancouver, it is stated that the Dominion Government is carrying on dredging operations in the Narrows which, when completed, will form a straight channel 1,250 ft. wide at the narrowest point and 35 ft. deep at low tide. It is also pointed out that there is no extra insurance on vessels entering Vancouver harbor, and that insurance does not cease when any vessel passes English Bay.

A difficulty has arisen at Vancouver regarding the payment of duty on fuel oil imported from the U.S. for the use of steamships, etc. The cargo of one vessel was held up there for four days recently, and the C.P.R. was compelled to enter into a bond for the amount of the duty claimed, to obtain its release. The oil shippers have stated that they will bring in no more fuel oil until a definite arrangement has been arrived at regarding the duty. It is stated that on this account, vessels using oil for fuel will have to take it on at Seattle, Wash.

E. H. Heaps, President, A.B.C. Elevator and Wharf Co., is reported to have stated, at Vancouver, July 12, that if there was no announcement from the Dominion Government shortly, in connection with the construction of a terminal elevator at Vancouver, his company would proceed at once with such an erection, and he hoped to be able to have it so far advanced, that they would be able to handle a part of this year's crop, provided the production was equal to present indications, and some of it was forced to seek outlet by Pacific ports.

An order in council has been passed, declaring Prince Rupert to be a shipping port, and the harbor to be a public harbor. The harbor includes Tuck inlet, Lake Wainwright and Porpoise harbor, with connecting and tributary waters enclosed between the main land and a line drawn north true across Venn passage through the east tangent of Dundas point, a line drawn north and south true through the west tangent of Snider rocks, a line drawn east and west true through the south tangent of Holland Island, and a line drawn north 34 degs. east and 35 degs. west true through the east tangent of Leer point.

Comments on the Dominion Canal Statistics and the Freight Rate Question.

A. A. Wright, Managing Director, St. Lawrence and Chicago Steam Navigation Co., Toronto, and ex-President, Dominion Marine Association, writes Canadian Railway and Marine World, as follows:

In your July issue, I notice an article on the Dominion Canal Statistics for 1911, in which you quote statements from the comptroller, J. Lambert Payne, which tend to show that the money expended by the government in canal construction and maintenance is wasteful and that freight can be carried cheaper by rail.

I do not think this was Mr. Payne's intention, but, in case it is, or that his article has been misunderstood, I would point out some important omissions in his calculations. He assumes that the railways are built entirely by private capital. In Canada at least this is not correct, as the usual practice is virtually for the government to build the railway and present it to the nominal owners, either by direct grants of land and money, or else by guarantees of bonds, or usually by both methods, which makes the country assume the entire cost and risk of the success of the road. The railway business is then put on a paying business by charging high rates. In fact, the extreme limit the traffic will bear, putting surplus earnings taken from the public into the road, eventually making the road worth the value of the original cost, plus the common stock issued, which is the promoters' profit, and the premiums to bond holders, before they are forced to reduce the rates by water competition or else by a railway managed by some other group of promoters.

The other mistake he makes is in charging the interest and cost of maintenance of canals against the volume of business which may be at the moment passing through, instead of on approximately the amount of traffic the canals could eventually take care of, because canals must anticipate business. It should be borne in mind also that the traffic passing through the Welland and St. Lawrence canals is now, and always has been seriously reduced by lack of facilities in Montreal to take care of the business, and it is notorious that for years men have been almost driven out of the Montreal trade because they could not get despatch for their vessels in that port. The present Welland and St. Lawrence canals could handle, without any difficulty, many times the volume of traffic which they are now handling, and, even an increase of 100%, which would quickly take place if Montreal furnished necessary facilities, would cut the government contribution for interest, maintenance, etc., from 0.265 per ton to just one half that amount.

Another matter which must not be lost sight of, is the effect of the canal competition on freight rates in general, and probably this can be appreciated just as well by mention of the fact that before the present canals were developed as they are now, freight rates as high as 32c. per bush, or \$10.66 a ton, have been paid on grain from Chicago to Montreal and no one need ask what the rail rate would be now from Chicago to Montreal if the canals had not been improved and were still the vessel rate, instead of \$1.50 a ton as at present.

Further, vessel rates are much higher than they need be, because the railways control most of the terminals, and delays and excessive elevator and other charges are necessarily added to the vessel rate, as it costs practically as much to keep a steamboat lying at a dock as running in the lake.

Contrast \$2 a ton, plus even Mr. Payne's charge of approximately another

\$2 a ton, or \$4 a ton on vessels for 1,245 miles, Fort William to Montreal, all water, with \$1.10 a ton Georgian Bay ports to Toronto on wheat, or \$1.70 a ton on lumber, 95 to 125 miles, or equal to about \$11 to \$16 a ton Fort William to Montreal. These rates show clearly that Mr. Payne's rail rates are competitive rates with water, and the Buffalo-New York route, and are not a fair example of rail rates.

It is needless to multiply examples, but I think I have shown that money intelligently expended on canal and waterway improvements is decidedly in the public interest. I am, however, decidedly in accordance with Mr. Payne's policy of showing what canal and waterway improvement costs, as I think that will have a tendency to discourage wasteful expenditures like the Trent and projected Georgian Bay canal.

The expenditure on lighthouses, etc., is well spent and cannot be charged against the canals, because on the upper lakes freight is carried by water at an average of about 40 cents a ton for an average distance of about 800 miles, or about 0.05 cents a ton mile, or about a tenth of average rail rates, which run about half a cent a ton a mile.

No better answer to the question of the relative cost of moving products by water as against all rail, need be stated than the fact that the railways are amongst the largest vessel owning corporations on the lakes.

A Reply by the Comptroller of Statistics.

A copy of Mr. Wright's foregoing letter was furnished the Comptroller of Railway and Canal Statistics, J. L. Payne, who has written Canadian Railway and Marine World as follows:—

With an earnest desire to avoid anything of a controversial character, it may not be amiss to say that the report to which your correspondent alludes was not in any sense intended to discount the value of our canal system in its relationship to our scheme of transportation facilities as a whole. The matter was dealt with purely from the statistical standpoint, and the figures used had reference to the year 1911. It is not, except in a broad way, the functions of a statistician to debate economic issues. His duty is to supply facts, and, incidentally, to present certain logical deductions. The discussion of the probable freight rate on our inland waters was last year undertaken in an academic spirit, in the absence of definite and basic facts. This year an earnest effort is being made to gather data which will enable that rate to be definitely and accurately determined. When that stage is reached, we shall, happily, be outside the realm of speculation. We shall be able to make a fair comparison of freight rates by water with freight rates by rail. So far as I know, this will be the first comprehensive inquiry of that character made in either Canada or the United States. It is true the Bureau of Railway Economics at Washington issued a report last year, making a comparison between freight rates on the Erie canal and on railways running parallel to that canal, but that report, valuable and helpful as it is, was not based on such a set of facts as the Department of Railways and Canals is getting for the year now current.

During May, three fatal, and four non-fatal accidents were reported in connection with the navigation of Canadian waters. Two of the deaths were due to falls overboard, and one to a fall into the hold.

The Imperial Export and Import Co., Ltd., has been incorporated under the Ontario Companies Act, with \$1,000,000 capital, and office in Toronto, to carry on the business of merchants, forwarders and warehouse men, and to act as agents for marine and other insurance, and as agents for vessels, etc.

Steamship Routes in Northern Waters.

The dream of establishing trade routes in far northern waters has been cherished by navigators for centuries, and has been the incentive of many voyages that are land marks in the history of exploration.

The partial realization of this dream now seems to be at hand. The long talked of Hudson Bay Railway, to connect with a steamship line via Hudson Bay, Hudson Strait, and the Atlantic to the Old World, is at last assured. If the hopes of its promoters are realized, it will afford for two or three months in the year an outlet for the vast resources of western Canada; above all, improved facilities for moving the Canadian wheat crop to European markets.

An analogous project on the other side of the Atlantic contemplates the establishment of regular steamship service between England and Siberia by way of the Kara Sea and the estuaries and the Yenisei and the Obi Rivers. This plan, proposed by an Englishman, Capt. Webster, has been approved by a Russian government commission. Steamers will run from English ports to a harbor on the southwest coast of Novaya Zemlia. There the cargoes will be transferred to smaller vessels (specially built for ice navigation, and thus carried to the Siberian rivers. It is expected that navigation will be limited to two months in the year, which will afford time for three round-trip voyages. The cargoes will include grain, timber, graphite, mica and other minerals.

Finally, the Russian government is making every effort to establish a regular sea route to northeastern Siberia by way of Behring Strait. During the summer of 1911 Rear Admiral Trajan, acting under instructions from the Imperial Ministry of Industry and Commerce, took the steamer Kolyma from Vladivostok to Nijní Kolymsk, at the mouth of the Kolyma River, where a quantity of freight was landed, after which the vessel returned to Vladivostok, the whole journey occupying two months. A little later in the season this feat was duplicated by a United States sailing vessel, equipped with an auxiliary motor. In this case the journey was made from Alaska.

The experience of the Kolyma showed that a light draught vessel, by keeping close inshore, was able to avoid the heavier ice fields. The Kolyma was not especially adapted for ice breaking.

Montreal Harbor Improvements.

Further improvements are contemplated by the Harbor Commissioners, involving an expenditure of about \$2,000,000. The plans cover the building of a concrete pier, 1,200 ft. long, straight into the river opposite the Commission's offices at the foot of McGill St. The place selected for this pier is now used as a basin for vessels entering and leaving the canal, and as, with the construction of the pier, this would not be possible, it is contemplated to remove the entrance to the canal to a more convenient point westward. Other improvements include the deepening of some of the old basins and the building of some concrete wharves, together with the lengthening of the King Edward, Alexandra and Jacques Cartier piers, by 300 ft. each. The new pier at the foot of McGill St. will give accommodation for two additional ocean going vessels.

Work on the increased elevator accommodation is progressing, also on other of the various improvements already in hand.

Plans are in course of preparation for additional permanent sheds and further improved railway facilities are also being discussed.

Canada-West Indies Steamship Service.

The existing contract for a steamship service between Canada and the British West Indies and British Guiana, expires July 1, 1913, and in consequence of the recent report of the commission appointed to enquire into the general service with the West Indies with a view to improvements and extensions, the Dominion Department of Trade and Commerce is inviting tenders for a mail, cargo and passenger service between Canada, the British West Indies and British Guiana, and between Canada and Jamaica. The service for the West Indies and Guiana is intended to be every 10 or 12 days from Canada, to Georgetown, calling each way at St. Kitts, Antigua, Montserrat, Dominica, St. Lucia, St. Vincent, Barbados and Trinidad, with Halifax or St. John, or both, as the Canadian ports. The tenderers are also asked to send proposals for a monthly service from Montreal, during the St. Lawrence navigation season, calling at Quebec each way, and the West Indies ports previously enumerated. Permission will be given for the vessels to call at any British port in the West Indies, and the contractor shall have the option of calling at any of the foreign islands for the sole purpose of discharging any Canadian cargo.

The Jamaica service is intended for vessels of from 1,600 to 3,000 net tons, having a speed of from 10 to 15 knots, sailing from either Halifax or St. John, or both, every 7, 10 or 12 days, calling each way at Bermuda.

In tendering, the following information must be given:—registered gross and net tonnage and passenger accommodation of vessels to be employed, average speed, period of round voyages, the annual subsidy required therefor, and the date on which the contractor will be in a position to supply the service.

Preference will be given, other conditions being equal, to the tenderer providing the most satisfactory conditions as to general accommodation, and also as to cool air chambers, insulation for the protection of fruit, etc.

The vessels to be employed must be of class A1, and be of British register, capable of maintaining a minimum speed of 12 knots when loaded at sea under normal weather conditions. The Minister of Trade and Commerce has power to prescribe the maximum freight and passenger rates, and to provide that no discrimination shall be made against Canadian importers and exporters.

The Largest Vessel Yet Constructed.

The s.s. Imperator, which is being built at Hamburg, Germany, for the Hamburg American Line, and which was launched recently, will exceed the ill-fated Titanic by some 5,000 tons. She is 900 ft. long, beam 96 ft. and molded depth 62 ft. From the keel to the boat deck will be 100 ft., and from the keel to the trucks of the masts will be 246 ft. The three funnels will be oval in section, measuring 18 ft. on the smaller and 29 ft. on the greater axis. The rudder will weigh 90 tons and the diameter of the rudder stock will be 2½ ft.

She will be driven by turbines of 70,000 h.p., which will be developed on four shafts. Her estimated speed is 22½ knots. She will have water tube boilers and will be fitted with U-shaped anti-rolling tanks. This device consists of tanks of large capacity, built on opposite sides of the vessel and connected by an inclosed waterway, through which the water can flow from side to side of the ship as she rolls, its flow being subject to control by valves.

The sub-division of the Imperator below the water line has been carried out under the supervision of the Germanic Lloyd's and the Immigration authorities. It consists of a series of intersecting transverse and longitudinal bulkheads. Transversely, the ship is subdivided by 12 bulkheads, which are carried two decks above the water line, with the exception of the collision bulkhead forward, which extends four decks above the same level. These bulkheads are intersected by longitudinal bulkheads, which subdivide the boiler and engine rooms, the under water portion of the ship being divided altogether into 24 separate watertight compartments. There are four boiler-rooms, containing the water-tube boilers. The coal bunkers are placed above the boiler rooms, and along the sides of the ship, in the latter case being known as wing bunkers. The longitudinal bulkheads are placed about 19 or 20 ft. in from the side of the ship, and they extend from bulkhead no. 4, aft to bulkhead no. 8. Astern of the aftermost boiler room is the forward turbine engine room, which is protected against flooding by two wing bulkheads, between which and the sides of the ship are placed the auxiliaries. The after turbine engine room is divided by a central longitudinal bulkhead.

Because of its great size, special interest attaches to the turbine installation. The rotor, or rotating part, contains 50,000 blades, and is capable of developing

over 22,000 h.p. The casing is 18 ft. in diameter and 25 ft. long. The shafting of all four propellers is 1½ ft. in diameter. The turbidum bronze propellers are 16 ft. 8 ins. in diameter. Although the engines are spoken of as being of 70,000 h.p. it is probable that on test they will develop from 80,000 to 85,000 h.p.

The Imperator will probably make her maiden trip to New York in the early summer of 1913.

Canadian Notices to Mariners.

The Department of Marine has issued the following:—

45. June 20. 117. Nova Scotia, Cape Breton Island, east coast, Sydney harbor, south east bar, gas buoy withdrawn, north west bar, conical buoy replaced by gas buoy.

46. June 26. 118. Ontario, Ottawa river, Lake Deschenes, Baskins wharf, change in front range light. 119. Ontario, St. Clair river, Sarnia, wreck of steamer Joliet, wrecking barges withdrawn, light-ship replaced. 120. Ontario, Georgian bay, Meaford, extension to east breakwater, temporary lights, caution. 121. Ontario, Georgian bay, south side, Lock-erie rock, change in position of gas buoy.

47. June 27. 122. British Columbia, Prevost passage, Joan rock, buoy established. 123. Alaska, Yakutat bay entrance, Ocean cape, light established. 124. Alaska, Prince William sound, Hinchinbrook entrance, Zaikoff point, light established.

48. July 2. 126 Maritime Provinces and Quebec, Canadian list of lights and fog signals, new edition. 127. New Brunswick, Bay of Fundy, Machias Seal island, easterly light permanently discontinued, erratum. 128. Prince Edward Island, south coast, Bedouque bay, change in position of Miscouche fairway gas buoy. 129. Newfoundland, south coast, Placentia bay, Little Burin island, fog alarm established.

49. July 8. 130. Bay of Fundy, Brier island, north west ledge, change in position of gas and whistling buoy. 131. Quebec, Gulf of St. Lawrence, Anticosti island, Bagot bluff, new lighthouse. 132. Ireland, north coast, Rathlin island light, alteration in character.

50. July 11. 133. New Brunswick, Bay of Fundy, east of Deer island, Tinker ledge, spindle erected. 134. New Brunswick, each coast, Northumberland strait, Richibucto harbor entrance, change in position of lights on the south beach and north beach.

51. July 13. 133. British Columbia, Vancouver island, Alberni canal, Somass river, beacons. 136. British Columbia, Seaforth channel, uncharted rock north of Dall patch, change in position of gas and whistling buoy. 137. British Columbia, Observatory inlet, beacon established, buoys established.

52. July 16. 138. Nova Scotia, Bay of Fundy, Lurcher shoal, light ship to be removed from her station temporarily for repairs. 139. Nova Scotia, Cape Breton island, east coast, Scatarie island, telephone line.

53. July 17. 140. Quebec, St. Lawrence River, survey steamer at work eastward of Father Point, caution.

54. July 18. 141. New Brunswick, Bay of Fundy, Chignecto channel, buoys in the vicinity of Grindstone island. 142. New Brunswick, Bay of Fundy, Calhoun flats, location and description of buoy.

55. July 18. 143. Ontario, Canadian list of lights and fog signals, new edition. 144. Ontario, Georgian bay, Meaford, extension to east pier, eastern entrance to harbor to be closed, light to be moved to the west end of breakwater.

The name of the steamboat Schwalbe, registered at Lunenburg, N.S., has been changed by order in council, to Northern Messenger.

Sault Ste. Marie Canals Traffic.

The following commerce passed through the Sault Ste. Marie Canals during June, 1912:

ARTICLES		CANADIAN CANAL	U. S. CANAL	TOTAL
Copper	Eastbound.....Short tons	864	10,040	10,904
Grain	"	4,133,652	1,536,926	5,670,578

Among the Express Companies.

The Canadian Northern Ex. Co. has opened an office at Birch River, Man., and has closed its office at Mafeking, Man.

The Adams Ex. Co. has adopted the system of issuing travellers' cheques, and has made arrangements throughout Canada, the U.S., and Europe, as well as other points, for dealing with them.

F. J. Butler, who has been agent, American Ex. Co., at Quebec, for several years, was entertained at dinner, July 4, by a number of friends on his leaving the city for Boston where he has been transferred on the company closing its offices on the Quebec Central Ry., over which, since it has passed under C.P.R. control, the Dominion Ex. Co., is now operating.

The Board of Railway Commissioners, July 3, refused the application of the city of Ottawa, for the extension of the collection and delivery limits for express companies. D'Arcy Scott, Assistant Chief Commissioner, in dismissing the application said that the Board's expert had already reported on the limits in March last, since when there had been no change of a character to warrant an extension.

Instructions issued by the Board of Railway Commissioners, regarding Sunday deliveries, require that express agents shall receive for carriage by the first train stopping at the consignee's station on Sunday, any shipment of medicines, drugs, instruments or apparatus, which they are assured by a physician, or a dealer in medical supplies, are urgently needed for saving human life, or alleviating human suffering. Such shipments must not be c.o.d.'s, and they must be prepaid and fully addressed, and tendered at the railway station. As house delivery may be impracticable and the agent at the consignee's station may not be required to meet the particular train, the shipper must be advised to telegraph the consignee to be on hand to receive the goods on arrival of the train.

As a result of the recent investigation into express rates, etc., in the C.S., by the Interstate Commerce Commission, a number of changes in regulations and practices, the methods of operation, and general rating have been ordered. Of the 13 companies dealt with, the report states that they are separate legal entities, but that it is interesting to regard the fact that by stock ownership and otherwise, they are so interlaced, intertwined and interlocked, that it is with difficulty that any one of the greater companies can be traced as either wholly independent in its management or the agency of a single railway system. So that while these companies compete with each other for traffic, the express business may be said to be almost a family affair. The new rates may be said to be based on a minimum charge of 21c. a pound, increasing in ratio to the increase of weight and distance, at rates varying from 3-10c. to 12c. a pound, approximately making 12c. the highest rate per pound for the greatest distance within the U.S., exclusive of Alaska. The reductions in general average about 15%.

Express Companies in Canada.

Following are particulars of the three express companies which have their headquarters in Canada:—

Canadian Express Company

This company was organized Feb. 16, 1865, under authority of 27 and 28 Vic., chap. 23. It has an authorized capital stock of 30,000 shares of \$100 each, of which 17,052 have been issued and are outstanding. The cash realized from the sale of these shares is reported at \$865,200. The purchase of the capital stock

of the company by the Grand Trunk Ry. Co. was effected in 1891 by the payment of \$660,000 in cash. The total capital liability at the time was \$1,500,000. Since then the capital stock has been increased to \$1,705,200. The company does not report a rate of dividend. All the stock is held in trust for the G.T.R. Co. by A. W. Smithers, C. M. Hays (since deceased), E. H. Fitzhugh, W. Wainwright, M. M. Reynolds, F. Scott, H. Paton and E. J. Chamberlin. With the exception of Mr. Smithers, these gentlemen are all directors of the company.

The officers are:—President, J. Pullen; Secretary-Treasurer, F. Scott; General Counsel, W. H. Biggar; General Auditor, W. W. Williamson. The headquarters are at Montreal.

The operations of the company are chiefly over the G.T.R., the G.T. Pacific Ry. and the Canadian Government Railway System. It has a total operating mileage of 7,230.

Dominion Express Company.

This company was organized May 23, 1873, under 36 Vic., chap. 113. The capital stock is \$2,000,000, divided into 20,000 shares of \$100 each, all of which is outstanding. Following are the directors:—Sir Thos. G. Shaughnessy, W. S. Stout, R. B. Angus, C. F. Smith and C. R. Hosmer. These directors are trustees of the entire stock of the company for the C.P.R. Co. A dividend on the capital stock, at the rate of 8% per annum was declared on June 30, 1911.

The officers are:—President and General Manager, W. S. Stout; Vice President, C. F. Smith; Secretary, H. C. Oswald; Treasurer, G. A. Newman; General Auditor, W. H. Plant. The head office is in Toronto.

The company carries on business over the lines of the C.P.R. and many connecting roads, and has an operating mileage of 13,709, apart from 14,148 of ocean going mileage.

Canadian Northern Express Company.

This company was organized June 13, 1902, under 2 Edward VII., chap. 49.

The company has an authorized capital stock of \$1,000,000, consisting of 10,000 shares of \$100 each. Of this stock \$300,000 was outstanding on June 30, 1911, on which a dividend was not declared. Mackenzie, Mann and Co., Limited, control the company by right of ownership of 90% of the capital stock. The directors are:—Sir Wm. Mackenzie, Sir Donald D. Mann, A. J. Mackenzie and Z. A. Lash. Headquarters are at Toronto, but the General Superintendent is located at Winnipeg.

The officers are:—President, Sir Wm. Mackenzie; Vice President, Sir Donald D. Mann; Secretary, R. P. Ormsby; Treasurer, L. W. Mitchell; Chief Solicitor, G. G. Ruel; General Counsel, F. H. Phippen; Auditor, J. D. Norton; General Superintendent, W. C. Muir.

The company operates almost entirely over the Canadian Northern Ry., and had a mileage on June 30, 1911, of 4,422.

The other express companies operating in Canada, but which have their head offices in the United States, are:—American Express, United States Express, National Express, Great Northern Express, Wells, Fargo & Co.

Telegraph and Cable Matters.

The Canadian Northern Telegraph Co. has opened an office at Birch River, Man., and has closed its office at Mafeking, Man.

The Grand Trunk Pacific Telegraph Co. has adopted the night lettergram service, which has been in use, for some time, by other companies.

The Western Union Telegraph Co. is stated to be negotiating for a site for a new cable office in Cape Breton, and that it will probably erect a building in Sydney.

The Great North West Telegraph Co. has opened an office at Wyebridge, Ont., has re-opened its offices at Birkendale and Rondville, Ont., and has closed its offices at Bayfield, Rosseau and Yarker, Ont.

The Marconi Wireless Telegraph Co. has opened a new office in the Strand, London, Eng. This has been connected with the Clifden, Ireland, station, by a private wire, in order to facilitate communication with Canada and the U.S.

The Western Union Telegraph Co. has lowered the rates between points in Canada and the U.S. which are comparatively near the border line, from 40c. for ten words to 30c., this reduction also affecting the night lettergram rates between the same points.

A meeting of superintendents of the various divisions of the C.P.R. telegraph system of the western lines, was held in the office of B. S. Jenkins, General Superintendent, C.P.R. Telegraphs, Western Lines, Winnipeg, July 15, for the discussion of proposed extensions and betterments of the service. It is stated that similar conferences will be held annually.

The Dominion Telegraph Co., held its annual meeting at Toronto, July 10. The financial statement for the year shows a credit balance of \$292,993.57. The company's lines are operated under lease by the Great North West Telegraph Co. for 99 years, at an annual rental of \$60,000, this amount being distributed to the shareholders in the form of dividend. The directors were re-elected for the current year.

D. Coons, Superintendent, Alberta Division, C.P.R. Telegraphs, is reported to have stated in Lethbridge, July 2, that telegraph lines were to be extended, at once, to Cardston, making a direct circuit to Calgary. Poles are being distributed along the route, and it is hoped to have the work completed in 30 days after commencing. Agents will be placed at Raymond, Magrath, Spring Coulee, Cardston and other points.

The Judicial Committee of the Privy Council decided, in London, Eng., July 10, that the contract between the Newfoundland Government and the Commercial Cable Co., of Feb. 1909, is valid, and binding on the Government. The contract was entered into by the last Government just before its defeat, and was repudiated by the present Government, which repudiation was upheld by the Newfoundland Supreme Court.

The matter of placing the Great North Western Telegraph Co.'s wires under ground at Sparks St., Ottawa, was again before the city board of control, July 11. Some time ago the city agreed to pay the G.N.W. Telegraph Co., which has perpetual wire rights on Sparks St., \$9,000 to have its wires placed underground in conduits, but the city solicitor recently wrote to the board of control to the effect that if the matter were taken to the Board of Railway Commissioners, it was probable that the company would be ordered to place the wires underground at its own expense or to pay rent for the use of the city conduits.

The Quebec Public Utilities Commission applied to the Board of Railway Commissioners, July 15, for an order directing the Great North West Telegraph Co., and the C.P.R. to comply with the Utility Commission's order respecting overhead wiring and precautions against fire. E. W. Beatty, General Solicitor for the C.P.R. questioned the Board's jurisdiction, and Assistant Chief Commissioner Scott announced that a letter had been received from the G.N.W.T. Co. agreeing to carry out the work. Ultimately the C.P.R. also agreed, and the case was recalled, the Board, in the meantime, being doubtful of its jurisdiction in the matter.

G. D. Perry, General Manager, Great North West Telegraph Co., who was in Ottawa recently, is reported to have stat-

ed that the company was in no way obstructing the matter of placing wires under ground, as alleged. The company was prepared to enter into a nagreement with the city in the matter some time ago, and a draft agreement was prepared, but the company was unable to execute it as it had granted certain privileges to the Ottawa Electric Co. If the city and the Electric Co. can come to an arrangement, releasing the G.N.W.T. Co. from its obligation, the company is prepared to commence the underground work at once.

Hints on Telegraph Matters.

By W. J. Camp, Assistant Manager, C.P.R. Telegraphs.

Following are extracts from a paper read at a meeting of the Association of Railway Telegraph Superintendents:—

INSULATORS.

During the period from 1887 to about 1898, the C.P.R. used white porcelain insulators on a portion of the long through wires. These were of German or British manufacture. An elaborate series of tests proved their great superiority over glass from a mechanical standpoint, the average blow necessary to break a porcelain being three times that required to break the glass insulator. It was also discovered that usually a porcelain insulator was only partially destroyed when hit by a stone, and that the wire was not set free and remained fastened to each pole, but the glass insulator was so badly shattered that the wire would be freed, and this frequently resulted in a cross with other wires which remained attached to the pole. This advantage was offset to some extent by the fact that, on account of the porcelain insulator being white, it offered a much better mark and was the one aimed at. The price of the porcelain insulator was increased until it reached about nine cents each laid down in Montreal, and its use by us, therefore, abandoned for some years. The glass insulator with which we were supplied then depreciated in quality, apparently on account of improper annealing, and appeals or complaints to the manufacturers resulted in no improvement; and, as the cost of the porcelain insulator was again very largely reduced, we have purchased nothing but white porcelain for the past three years.

In 1910 we procured porcelain insulators from Canada, the United States, and Germany. One make turned out to have defective insulation properties, and we had a series of tests made comparing the three manufactures and glass. All of the insulators were of the same pattern and dimensions. One dozen insulators of each make, selected at random, were placed on pins in the open air, and frequent readings taken of insulation, humidity, temperature and barometer. During the tests the weather was of nearly every description, from dry cold to sleet, wet snow and rain. These tests proved that in every respect the German and United States insulators had from 5 to 10 times the insulating qualities of the Canadian and glass insulators, the two former giving practically the same results with a slight difference in favor of the German, and the Canadian porcelain and glass almost on a par. Tests of wires after erection show the same differences.

TRANSPPOSITIONS.

The first telephone dispatching circuit we installed was transposed every half mile. The selectors were in series, alternating on each wire. The circuit was found to be slightly noisy, and we then transposed it every quarter mile, which cut down the noise for a time, but we found it almost impossible to keep the circuit free from noise while working the selectors in series; and, as we found that most of the failures were due to the contact points of the relay, we

changed from series to main line bridging selector without relay. Since then the circuit has been practically free from noise, and on all subsequent circuits installed the same method has been followed. We now transpose all our dispatching circuits every quarter mile, except where two circuits parallel each for a portion of the way. Over this section one circuit is transposed every quarter mile, and the other every half mile. Looking forward to the time when the telephone will be used for other work, we arrange transpositions on our copper telegraph wires (and sometimes on the iron), every half mile for the first pair, and for the second pair, every mile, or transposed at the quarter, three-quarter, and mile, skipping the half mile.

Our method for transposing when the two wires are on the same arm, is by the use of a curved iron bracket under the arm, and so placed that the wire it carries comes directly under the wooden pin carrying the other wire over the top of the arm. This bracket is specially made for us, but the arrangement is similar to that of the Harvard Co. Where the two wires are on separate arms we place an extra pin on the upper arm half way between two of the regular pins, and skip the pin on the lower arm. By these methods we have largely decreased the liability of crosses in case of broken insulators.

LIGHTNING PROTECTION.

The problem of adequate lightning protection is a most serious one with the C.P.R. on the portion of the line between Lake Superior and the Rocky Mountains on account of the excessive severity of the lightning in this district. I might say that we are between the devil and the deep blue sea. If we use sufficient arresters to take care of the frightful discharges, we most likely will kill the telephone circuit by having so many "traps for bugs." We have been using in the stations where the fone line is looped, four Argus arresters, without fuses, on the four ends of the wires, and two Argus arresters with fuses on the bridge wires to the fones and selector. At stations where the circuit is only legged in we have two Argus arresters, with fuses. At the dispatchers office, besides the Argus arresters, we equipped the first three poles from the office with O'Connell pole arresters. In some sections this protection seems to be adequate, the circuit being worked right through storms, but in the district above mentioned it does not appear to be sufficient, my reports showing that at times the telephone has to be abandoned for an hour or more on account of lightning. There have been some interruptions on account of the pole arresters, and this year we are trying out the branch office and pole arresters to the same extent as the former equipment. Some of our superintendents have asked for pole arresters at every station, but I am afraid that if such were installed they would prove to be an endless source of trouble and annoyance, and that after every severe lightning storm, the circuit would be out of commission until a lineman could be sent over it.

TELEPHONE INSPECTORS.

On the C.P.R. we have one telephone inspector for 250 to 300 miles of circuit, with his headquarters approximately in the centre. Up to the present we have not found it necessary to provide the inspectors with motor cars, but, personally, I believe that every inspector should have a light motor car, particularly in sections where there are comparatively few trains. Our inspectors are supposed to be continually on the move. I consider that an inspector's duty is not so much to remove interruptions, as to prevent them occurring.

TRAIN TELEPHONE SETS.

On every section where we install tele-

phone train dispatching circuits we equip every train with a telephone outfit, without selectors. The wrecking cars are provided with howler receivers, by means of which the dispatcher can call them in on the line if necessary. The connecting pole we use is the invention of J. F. Richardson, Superintendent of Telegraphs, C.P.R. British Columbia Division. It is so arranged that connection can be made with any two wires on the line, no matter whether they are on the same arm or not. We do not install any equipment at outlying sidings, as the train equipment answers every purpose should a train become stalled anywhere. On account of the severity of our climate during a portion of the year, no one could use a telephone at a pole box, and each outfit contains sufficient flexible twin wire to lead the circuit into the baggage car or conductor's caboose.

Trade and Supply Notes.

The matter which appears under this heading is compiled, in most cases, from information supplied by the manufacturers of, or dealers in, the articles referred to, and in publishing the same we accept no responsibility. At the same time, we wish our readers to distinctly understand that we are not paid for the publication of any of this matter, and that we will not consider any proposition to insert reading matter in our columns for pay or its equivalent. Advertising contracts will not be taken with any condition that accepting them will oblige us to publish reading notices. In other words, our reading columns are not for sale, either to advertisers or others.

The Ohio Brass Co., Mansfield, Ohio, has distributed its new general catalogue 12, which contains a listing of all the company's lines, including catenary materials, 1,500 volt materials, 750 volt overhead material, rail bonds, third rail insulators, O-B high tension insulators and car equipment specialties. The catalogue is bound in cloth and contains 490 pages, which include, besides the listing of the different devices, considerable data relative to construction schemes.

The Canadian Westinghouse Co. has secured a contract from the Shawinigan Water and Power Co., Shawinigan Falls, Que., for one 15,000 k.w. 2 bearing water wheel type, 60 cycle generator, which is said to be the largest water wheel generator to be installed in Canada. This will be the third unit which the Westinghouse Co. will have furnished from its Hamilton shops for the Shawinigan Co.'s new power house, the other two units being of slightly smaller capacity, viz., 14,000 k.w.

J. J. Gartshore, Toronto, who some time ago purchased the rails, etc., of the Opeongo Logging Ry., a line of 14 miles running north from Whitney, Ont., to Lake Opeongo, has disposed of all the rails, etc., except of about three miles, and the whole of the material has been lifted. The rails, which are principally 56 lbs. per yard, have seen considerable service, but are still in good condition. Mr. Gartshore advises that the demand for light rails and contractors' equipment generally has been very active during the past few months, owing to the large railway contracts which have been given out.

"The Use of Highly Superheated Steam in Locomotive Practice," an illustrated 28 page booklet, has recently been distributed by the Locomotive Superheater Co., 30 Church St., New York. In it, the development and present day practice in the use of highly superheated steam are outlined, the valuable feature of the booklet lying in the fact that the information contained is for the most part data obtained from outside sources, and consequently, does not savour strongly of the standard type of catalogue. The different types of superheaters made by the company are described in their application to all types of locomotives, incidentally devoting some space to the matter of applying superheaters to existing locomotives.

Department of Railways and Canals, Canada

HUDSON BAY RAILWAY.

Notice to Contractors.

SEALED TENDERS addressed to the undersigned and endorsed "Tender for construction of Hudson Bay Railway," will be received at this office, until 16 o'clock, on Thursday, the 1st of August, for a section of about 68 miles from Thicket Portage to Split Lake Junction.

Plans, specifications and form of contract to be entered into can be seen on and after Friday, June 14th, at the office of the Chief Engineer of the Department of Railways and Canals, Ottawa, and at the office of the Chief Engineer of the Hudson Bay Railway, Winnipeg, at which places forms of tender may be obtained.

Parties tendering will be required to accept the fair wages schedule prepared or to be prepared by the Department of Labor, which schedule will form part of the contract.

Contractors are requested to bear in mind, that tenders will not be considered, unless made strictly in accordance with the printed forms, and in the case of firms, unless there are attached the actual signature, the nature of the occupation, and place of residence of each member of the firm.

An accepted bank cheque for the sum of \$150,000.00 made payable to the order of the Minister of Railways and Canals, must accompany each tender, which sum will be forfeited if the party tendering declines entering into contract for the work at the rates stated in the offer submitted.

The cheques thus sent in will be returned to the respective contractors whose tenders are not accepted.

The cheque of the successful tenderer will be held as security of part security, for the due fulfillment of the contract to be entered into.

By order,

L. K. JONES

Secretary.

Department of Railways and Canals,

CANADIAN RAILWAY CLUB, J. Powell, St. Lambert, Que. Meetings at Montreal

KINGSTON AND PEMBROKE RAILWAY COMPANY.

Notice to Shareholders.

The Annual General Meeting of the Shareholders of the Kingston and Pembroke Railway Company for the election of directors and the transaction of business generally, will be held at the Head Office of the Company in the City of Kingston, on Wednesday 14th day of August next, at the hour of 11.00 o'clock in the forenoon.

The meeting will be made special for the following purposes, namely:—

1. To consider whether it is expedient to lease this Company's Railway to the Canadian Pacific Railway Company, and if so, to approve of the terms, conditions and form of lease.

2. To consider and decide upon the means to be adopted for raising funds to retire outstanding mortgage debentures and for other purposes of the Company, and if an issue of bonds be decided upon, then to fix the respective amounts thereof, the rate of interest, and the other terms upon which they shall be issued and to approve the form of mortgage (if any) to be given to secure re-payment of the said bonds.

The Stock Transfer Books will close in New York on Saturday, 3rd, August, 1912. All books will be re-opened on Thursday, 15th day of August, 1912.

A. McNAUGHTON,

Secretary.

Kingston, Ont., July 11th, 1912.

PATENT RIGHTS FOR SALE

Patent Act. Take notice, that the undersigned are prepared to supply, at a reasonable price, sheet metal dumping cars for railroad contractors' use described in Canadian Patent No. 116,207, or to grant anyone desiring to use the same a license to have the same manufactured for him at a manufacturing establishment in the Dominion of Canada. They are also prepared to receive offers for licenses to manufacture and sell under the same. Ridout & Maybee, Manning Chambers, Queen Street West, Toronto, attorneys for the Goodwin Car Company.

2nd Tuesday each month, 8.30 p.m., except June, July and August.

NOVA SCOTIA SOCIETY OF ENGINEERS, A. R. McCleave, Halifax, N.S.

QUEBEC TRANSPORTATION CLUB, J. S. Blanchet, Quebec.

WESTERN CANADA RAILWAY CLUB, W. H. Rosevear, 25½ Princess St., Winnipeg. Meetings at Winnipeg 2nd Monday each month except June, July and August.

TENDERS

TENDERS, addressed to the undersigned at Ottawa, and endorsed on the envelope, "Tender for Customs Steamer," will be received up to noon of the

Second Day of September, 1912.

for the construction of a Twin-screw Steel Steamer for Customs Service on the Atlantic Coast, to be delivered at the port of Quebec, of the following leading dimensions, namely: Length, between perpendiculars, 185 feet; breadth, 32 feet; draught, 10 feet 6 inches, and speed, 15 knots per hour.

Plans and specifications of this steamer can be seen at the Department of Customs, Ottawa, and at the offices of the Collectors of Customs, Toronto, Collingwood, Montreal, Quebec, St. John, N.B., and Halifax, N.S.

Plans and specifications can be procured upon application to the Commissioner, Department of Customs, Ottawa.

Each tender must be accompanied by an accepted bank cheque in favor of the Commissioner of Customs, equal to ten per cent. of the whole amount of the tender, which cheque will be forfeited if the successful tenderer declines to enter into a contract with the Department, or fails to complete the steamer.

Cheques accompanying unsuccessful tenders will be returned.

The Department does not bind itself to accept the lowest or any tender.

Newspapers copying this advertisement without authority from the Department will not be paid.

JOHN MCDUGALD,

Commissioner of Customs.

Department of Customs,

Ottawa, 19 July, 1912.

TENDERS for Steamship Service between Canada, the British West Indies and British Guiana and between Canada and Jamaica.

1. Tenders for mail, cargo and passenger steamship services are invited between—

(a) Canada, the British West Indies and British Guiana, and between

(b) Canada and Jamaica,

and will be received at the office of the Minister of Trade and Commerce, Ottawa, Canada, until noon on the First day of October, nineteen hundred and twelve.

2. Tenders are to be sent in sealed envelopes addressed to the Minister of Trade and Commerce, and to be marked respectively "Tenders for Steamship Service between Canada, the British West Indies and British Guiana" and "Tenders for Steamship Service between Canada and Jamaica," and, if submitted through the post, should be registered.

3. The respective services shall consist of such sailings as may be hereafter determined according to the various descriptions of the alternative services on the two routes for which tenders are requested.

CANADA, BRITISH WEST INDIES, AND BRITISH GUIANA.

4. Tenders are invited for one or more of the following Services, sailing every ten days or every 12 days (as may be submitted in the proposals), from the Canadian port of departure hereinafter designated to Georgetown, and calling each way, or such variation thereof as may be stated in the proposals, at the following islands in the British West Indies, viz.:—

St. Kitts, Antigua, Montserrat, Dominica, St. Lucia, St. Vincent, Barbados and Trinidad:—

(a) Sailing from Halifax to Georgetown and returning to Halifax.

(b) Sailing from St. John to Georgetown and returning to St. John.

(c) Sailing from Halifax to Georgetown and returning to St. John and Halifax.

(d) Sailing from St. John to Georgetown and returning to Halifax and St. John.

5. Tenders are also invited for a monthly service from Montreal, during the season of navigation in the St. Lawrence River, to

Georgetown, calling each way at Quebec and the West Indies Islands or such variation thereof as designated in paragraph 4, the service referred to in this paragraph to be combined with one of the services described in the said paragraph 4.

6. Permission will be given to call at any British port in the West Indies on either North or South-bound voyages, and the Contractor shall also have the option of calling at any of the foreign islands in the West Indies for the sole purpose of discharging Canadian cargo.

CANADA—JAMAICA.

7. Consideration will also be given to the proposals submitted by tenderers for alternative services of 10, 12 and 15 knots average speed, with steamships having a tonnage of from 1,600 to 3,000 net tons.

8. Tenders are also invited for one or more of the following Services sailing from the Canadian port of departure hereinafter designated every 7, 10 and 12 days (any one or all of which may be submitted in the proposals), to Jamaica, calling each way at Bermuda:—

(a) Sailing from St. John to Jamaica and returning to St. John;

(b) Sailing from Halifax to Jamaica and returning to Halifax.

(c) Sailing from St. John to Jamaica and returning to Halifax and St. John.

(d) Sailing from Halifax to Jamaica and returning to St. John and Halifax.

(e) Sailing alternately from St. John and Halifax to Jamaica and returning to one of the said ports other than last port of departure.

9. Consideration will also be given to proposals submitted by tenderers for alternative services of 12 and 15 knots average speed, with steamships having a tonnage of from 1,600 to 3,000 net tons.

GENERAL CONDITIONS.

10. Tenders are invited for such Service or Services on the respective routes as may be stated in the proposals in any way varying the ports of departure, ports of call, or frequency of sailing of the various services described in paragraphs 4 to 9 inclusive, it being the desire of the Minister to have as wide a range of Service tenders as possible so that he may be able to select one for each of the routes which is best adapted to the requirements in point of efficiency and practicable cost.

11. Tenders may be submitted for any or all the services described in the foregoing for 5, 10 and 15 years respectively.

12. Tenders must state:

a) The registered gross and net tonnage and passenger accommodation of the steamships to be employed, and

(b) the average speed of such steamers, and

(c) the period of round voyage for the service or services proposed, and

(d) the annual subsidy required therefor, and

(e) the date upon which the Contractor will be in a position to supply the service or services tendered for.

13. Preference will be given, other conditions being equal, to the tenderer providing the most satisfactory conditions vide paragraph 12, and also as to cool air chambers, insulation for protecting fruit, etc.

14. The vessels to be employed shall be of the class A1, and be of British register, and be capable of maintaining a minimum speed of 12 knots when loaded at sea under ordinary weather conditions.

15. The Contractor is to land and embark all mails at terminal points and ports of call at his own expense.

16. The Contractor shall be subject to such general conditions as are incidental to all similar steamship contracts granted by the Canadian Government.

17. The Minister shall have the power to prescribe the maximum freight and passenger rates and provide that no discrimination shall be made against Canadian importers or exporters.

18. The Minister does not bind himself in either case to accept the lowest or any tender.

(Sgd.) F. C. T. O'HARA,

Deputy Minister of Trade and Commerce.
Department of Trade and Commerce,
Ottawa, June 8, 1912.

Note.—(a) The present contract for a steamship service between Canada, the British West Indies and British Guiana expires July 1, 1913.

(b) There is no contract existing at present for a service between Canada and Jamaica.

The insertion of this advertisement unauthorized will not be paid for.—24043.

Electric Headlight Saves Train

(From Daily Papers)

"Wednesday night B_____forgot to deliver an order to hold Eastbound Passenger Train, No 8, and only the fact that the Electric Headlight of the oncoming Passenger train was seen at a great distance by the Engineer of the Westbound Freight prevented a head end collision in the_____Canyon near_____. The warning light was seen in time to enable the freight to get back on to the siding at_____."

Railroads Operating in Alkali Districts

Find Dearborn Treatment indispensable for prevention of the foaming troubles experienced.

By the use of the treatment the mileage per boiler washing can be increased to such an extent that the saving in the item of boiler washing expense alone will pay for the treatment, without considering the other benefits—elimination of engine failures—ability to haul greater tonnage—and general improvement of the service.

DEARBORN DRUG & CHEMICAL WORKS

McCORMICK BUILDING, CHICAGO

Synopsis of Dominion Land Regulations.

Any person who is the sole head of a family, or any male over 18 years old, may homestead a quarter section of available Dominion land in Manitoba, Saskatchewan or Alberta. The applicant must appear in person at the Dominion Lands Agency or Sub-agency for the district. Entry by proxy may be made at any agency, on certain conditions by father, mother, son, daughter, brother or sister of intending homesteader.

Duties.—Six months' residence upon and cultivation of the land in each of three years. A homesteader may live within nine miles of his homestead on a farm of at least 80 acres solely owned and occupied by him or by his father, mother, son, daughter, brother or sister.

In certain districts a homesteader in good standing may pre-empt a quarter-section alongside his homestead. Price, \$3.00 per acre.

Duties.—Must reside upon the homestead or pre-emption six months in each of six years from date of homestead entry (including the time required to earn homestead patent) and cultivate fifty acres extra.

A homesteader who has exhausted his homestead right and cannot obtain a preemption may enter for a purchased homestead in certain districts. Price, \$3.00 per acre. **Duties.**—Must reside six months in each of three years, cultivate fifty acres and erect a house worth \$300.00.

W. W. CORY,

Deputy of the Minister of the Interior.

YOU Need This Railroad Library

—a library that will give you the best up-to-date modern practice. There is no other reference

work in the world that so completely meets the needs of the railroad man as the INTERNATIONAL RAILROAD LIBRARY. This is an epitome of the years of experience of the best railroad experts in the country edited in a style that 18 years of experience in publishing home-study textbooks has proved the easiest to learn, to remember, and to apply. The volumes of this library are a part of a series of textbooks that cost \$1,500,000 to prepare. They are recommended by the highest authorities and are used in nearly all our leading universities and colleges. Not only can they be used to great advantage by superintendents, railroad officials, foremen, engineers, firemen, conductors, and brakemen as an authoritative guide in their work, but since they can be so clearly understood even by persons having no knowledge of higher mathematics, they can be used by all classes of railroad employes that are desirous of advancing to higher positions. Write for catalog now.

EDISON BSCo

PRIMARY BATTERY

The Standard Closed Circuit Cell

Railway Signal Systems, although usually operated on low voltage, must be installed with practically the same care for each detail as that required in power work.

When you consider the purpose for which the system is installed, it is not difficult to understand why this should be so. While the primary object of signals is the protection of life and property, a properly designed system is an important economic factor, making for the greatest return on capital invested by allowing the operation of the maximum number of trains over any given section of track.

These reasons are sufficient to call for a high grade of material and workmanship; add to them the necessity for reliability in order to gain the confidence of the men to whom they furnish the information, and the urgent need of operation as near perfection as it is possible to get, is apparent.

The Edison BSCo cell is constructed with the idea of enabling the railroad company to obtain service of this kind. In its manufacture, not a detail that would impair its efficiency is slighted and its adoption is an aid of no small proportions in assisting the signal department to furnish the service which the importance of the work demands.

Railroad Shops Are Using "Thermit"

Because it saves them thousands of dollars, welding their broken locomotive frames, driving wheel spokes, connecting rods and all other heavy wrought iron and steel sections.

It is seldom necessary to dismantle the engine and it can be returned to service in twelve working hours after entering the repair shop.

We feel confident that the "Thermit" process of welding can save you thousands of dollars.

Are you willing to give it a trial?

Write for Pamphlet 21 N and reactions; they show you what we are doing for others.

BRADSTREET'S

Capital and Surplus, \$1,500,000.

Offices throughout the Civilized World.

Executive Offices:

NOS. 346 and 348 BROADWAY,
N.Y. CITY, U.S.A.

The Bradstreet Company gathers information that reflects the financial condition and the controlling circumstances of every seeker of mercantile credit. Its business may be defined as of the merchants, by the merchants, for the merchants. In procuring, verifying and promulgating information, no effort is spared, and no reasonable expense considered too great, that the results may justify its claim as an authority on all matters affecting commercial affairs and mercantile credit. Its offices and connections have been steadily extended, and it furnishes information concerning mercantile persons throughout the civilized world.

Subscriptions are based on the service furnished, and are available only by reputable wholesale, jobbing and manufacturing concerns, and by responsible and worthy financial, fiduciary and business corporations. Specific terms may be obtained by addressing the Company at any of its offices.

Correspondence Invited.

PROFESSIONAL CARDS.

THE RAILWAY AND MARINE WORLD is especially adapted for the publication of professional cards of engineers, inspectors, analysts, electrical experts, naval, grain elevator and other architects, solicitors, etc., who desire to bring themselves under the notice of the management and officials of the various steam and electric railway, steamship, grain elevator, telegraph, telephone and power companies throughout Canada, as well as the locomotive, car and shipbuilders, contractors and promoters of railway enterprises. THE RAILWAY AND MARINE WORLD is the only medium through which all these important classes can be reached.

Rates will be quoted on application.

NEW 8-FEED DETROIT LUBRICATORS

CANADIAN DETROIT LUBRICATOR COMPANY, LTD.
WINDSOR, ONT.

The new 8-feed Detroit Locomotive Lubricator is used on superheater Mallet compound locomotives. The six outside feeds lead to the high pressure steam chests, the high pressure cylinders and the low pressure steam chests.

The two middle feeds can be used for two air pumps, or for one pump and an intercepting valve or for one pump and a mechanical stoker.

A half turn of the oil control valve permits of all the feeds being started or stopped instantly without disturbing the adjustment of the feed regulating valves. A quarter turn cuts off all but the two middle feeds.

The new Detroit Locomotive Lubricators give greater oil mileage, easier control and better lubrication than any other lubricators on the market. Our circular tells why.

Sales Agents, Taylor & Arnold, Limited, Montreal.

“BROWNHOIST” LOCOMOTIVE CRANES

“Brownhoist” Crane Coaling Engine on N. Y., N. H. & H. R. R. from cars on side track.

A RAPID AND ECONOMICAL METHOD of handling coal from car to engine or from car to coal tipple. The crane coals the engine while it is being cleaned on the ashpit. It cleans the pit, placing the ashes into the car. Many roads use the crane to fill the pockets on their coal chutes. Time and money are saved on both of these methods of coaling an engine.

ON CONSTRUCTION WORK the crane is a labor saver. The crane excavates, drives piling with full driver, handles construction material of all kinds, switches the cars, places heavy steel structures, and does all the lifting and moving of material.

AROUND THE SHOP AND YARD the crane handles ALL material. It can be equipped with either grab bucket, bottom block, or lifting magnet. Either one is easily and quickly applied.

“Brownhoist” Cranes are built for hard and continuous service.

Westinghouse Portable Air Compressor
with Alternating Current Motor

Westinghouse Portable Motor Driven Air Compressors

THE simplicity and compactness of these outfits recommends them particularly for general use in car barns, power houses, railroad yards and shops where cleaning or drying is done by compressed air.

The reservoirs and motor compressor are firmly attached to the truck, together with the necessary switch, governor, fuses, etc. These portable outfits are furnished for either direct or alternating current operation on all commercial voltages.

The Advantages of the **EDISON STORAGE BATTERY** For Axle Train Lighting Systems

The peculiarities of the axle generator system of train lighting, due to the necessities of transportation, are such that a storage battery is manipulated in anything but a normal manner. Sulphation, buckling, failure through overcharge, and rapid deterioration through idleness, when partially discharged, are factors which militate against the life and usefulness of the lead cell with this system.

Sulphation, for example, causes high voltage indications, rendering the automatic features of modern axle lighting systems inoperative at such times as would give false indications of fully charged batteries.

The Edison battery will retain its original capacity no matter how the output of the axle generator fluctuates or how quick the rate of discharge, and it will remain in a discharged condition for an unlimited length of time without any deterioration. Unlike the lead cell, Edison plates have the same dimensions from the time they are put into service to the end of their useful life.

The great physical strength of Edison battery construction enables it to resist continued vibration and concussion.

Saving in weight for the same ampere hour capacity is another big advantage of the Edison battery for every type of train lighting system. The amount of money saved in haulage costs alone would establish the economy of this battery for train lighting, even if it did not possess a single one of the notable advantages mentioned above. On a 32 volt system, this battery saves one ton per installation. This annually amounts to 108,000 ton miles per car.

Send for our newest bulletin, No. 1018, "Edison Train Lighting Batteries."

TITANIUM RAILS WIN OUT ON BOSTON ELEVATED

The service on the Boston Elevated is said to be the severest in the world. Note how test proved superior durability of open-hearth Titanium rails laid alternately with plain open-hearth rails.

CONDITIONS OF TEST

All rails A.S.C.E. Section 85lbs
per yard.

Laid April 1st, 1911.

Measured October 31st, 1911.

In service when measured. 214 days

Average wear in square inch (for all rails)

	Open-Hearth	Titanium Open-hearth
In 214 days	.755	.537
Per 1,000,000 tons (approximately)	.0686	.0488

Test rails laid alternately on
high side of track.

Radius of curve, 100 feet.

Grade, 5 per cent. down.

Track elevation, 3 inches.

Ratio of Wear

For all Rails

Titanium to Open-hearth

1 to 1.41

Titanium rails cost only about \$2 more per ton than untreated rails. When you order, specify that our men shall look after the Titanium addition. On this condition we will make no charge for their services.

TESTS ON SOME OTHER ROADS

Boston & Maine 55% to 186% . . . in favor of Titanium Rails.
(Showing, that as the trial continues, the figures improve in favor of
Titanium as evidenced by previous measurements already published.)
Lehigh Valley 54% . . . in favor of Titanium Rails.
Baltimore & Ohio 56% . . . in favor of Titanium Rails.

Booklet No. 22 explains in detail the superiority of Titanium-treated iron and steel. Rail diagrams of above tests gladly sent on request.

Output of Titanium Steel in 1910 was 326,300 gross tons.
Output of Titanium Steel in 1911 increased to 410,600 gross tons.

Titanium Alloy is made for Canadian Consumption

C. G. E. Gas Electric Cars

The Gas Electric Car

Electricity is the silent and efficient transmission link, furnishing power and brilliant illumination.

Is materially reducing operating costs and increasing traffic on branch railway lines wherever used.

The records of thousands of miles of operation in actual service prove the usefulness and reliability of this car.

Built as a Railroad Proposition

Strong, reliable, efficient and attractive. M. C. B. throughout. Just as the trolley car successfully displaced the horse car, so with equal success and profit the C. G. E. Gas Car is now replacing branch line trains.

Catalogue 4855 illustrates and describes the equipment and shows many car body designs. This will be sent you by return mail for the asking.

Power Cost

is of Prime Importance
in every factory.

We can positively demonstrate to **your** satisfaction that we can give you a 100% investment--Can prove it in dollars and cents.

It is actually possible to save 60% per h.p. per year with a Bowser Oil Filtration and Circulating System.

Just a "nod" from you will bring the proof and it will incur no obligation.

Note The Formula

We give above the proper comparative basis on which to consider oiling systems. In this day every engineer or manager wants to know what he is buying. Don't accept somebody's statement that an oiling system will do certain things—Use the formula above and figure it out for yourself. Cut out the tables and file for reference.

When you buy a boiler you demand the amount of heating surface—On the same basis of reasoning, why not demand the amount of filtering surface in an oiling system.

Study the Diagram

The Bowser Oil Filtration and Circulating System is all that the name implies.

Note these new and exclusive features that make it a system.

Continuous in Operation—10 to 15 hours oil supply at all times.
Easily Accessible for Cleaning.
Less Floor Space Proportionate to Filtering Surface.
Oil Level in Gravity Tank Automatically maintained.
Inspected and Cleaned Without Shutting Down.

Sediment Trays and Screen Arrangement Remove Heavier Impurities Before Final Filtering, Permitting Finer Filtering Material.
All Tanks free from Pressure.
Three Square Feet Filtering surface each Gallon of oil filtered Per Hour.
Water Automatically Expelled.

Let us send you literature giving greater detail—Write for Catalog No. 52.

S. F. Bowser & Co., Inc., Ft. Wayne, Ind.

Branches:
Boston, New York, Philadelphia, Atlanta, Minneapolis, Dallas, Chicago, St. Louis, San Francisco, Toronto.

For twenty-seven years manufacturers of Self-Measuring Pumps, Gasoline and Oil Storage Systems, Self-Registering Pipe Line Measures, Dry Cleaning Systems, etc.

The Bowser Oil Filtration and Circulating System

possesses the following exclusive features which account for its superiority:

Continuous Operation---10 to 15 hours' Oil Supply at all times.
Easily Accessible for Cleaning.
Less Floor Space proportionate to filtering Surface.
Oil level in Gravity Tank Automatically Maintained.
Inspected and Cleaned without shutting down.

Sediment Trays and Screen Arrangements remove heavier impurities before final filtering, permitting finer filtering material.

All tanks free from pressure.
Three sq. ft. Filtering Surface for Each Gallon of Oil per hour to be filtered.
Water automatically expelled.

Here's another reason for Bowser service and success: Our corps of engineers is ready to look over your plant and give expert advice, not only on a proper oiling system, but on other arrangements as well, that will improve your service and cut your cost. This special service is gratis, and does not obligate the enquirer in any way. All we want to know is that you are interested in reducing the cost of your power and engine room maintenance.

Ask for Catalogue No. 18.

A Perfect Cab Signal System!

THE SIMMEN SYSTEM

**Approved by the Railroad Commission of the State of Indiana
for Use in That State.**

The Simmen System of Railway Signalling and Train Despatching is a cab signal system of remarkable simplicity, which has been proved successful at the highest speeds and under all possible weather conditions. All the advantages inherent in cab signal systems are fully realized in combination with an efficiency of the highest order. Visible light signals in the cab, "Clear" or "Danger," as the case may be, are continuous and positive, and the changes from one to the other vivid and unmistakable. The risk of missing fixed signals on the roadway in fog or snow storm is entirely obviated. Consequences of oversight thoroughly guarded against. Head-on collisions are prevented by interlocking of automatic electric switches on the Despatcher's table, and stop signals are displayed at a safe distance from sidings.

False "Clear" signals are an impossibility, since any derangement of any circuit automatically causes the display of a red light. Third (contact) rails at every siding permit of telephone communication between cab of engine and Despatcher's office. Cost of installation much less than that of other systems and cost of maintenance practically nominal.

Despatcher's Table.

\$50,000 Lost Last Year

At the prices which have been paid for brake shoes by the Canadian Railroads, over three dollars a ton has been lost.

We know that the initial cost is not the only factor to be considered in accomplishing a saving, but taking this only into consideration, every thousand tons purchased represents a loss of over \$3,000.

It is true that the first great saving was made when steel reinforced brake shoes were adopted, but we come to you now with an additional saving far more important than the first.

We not only give improved service; our double steel reinforced brake shoe wears to extreme thinness, grips the wheel firmly, is extra strong and therefore safe, and gives minimum scrap, each of which features is a saving in itself. But we go still further—the price at which we can make this improved and perfected brake shoe entirely wipes out the heavy loss shown above.

A brief investigation now will uncover the trouble. May we co-operate with you in setting it right?

If you have not used our shoe yet, drop us a line and we will send you enough to equip one coach free of charge.

ONTARIO

Why the C. P. R. North Toronto Route to Ottawa and Montreal is the Logical One

The train leaves as follows:

Leave North Parkdale	-	-	-	9.15 p.m.	Arrive Ottawa, 6.50 a.m.
Leave West Toronto	-	-	-	9.30 p.m.	Arrive Montreal, 7.00 a.m.
Arrive North Toronto	-	-	-	9.40 p.m.	Daily.
Leave North Toronto	-	-	-	10.00 p.m.	Will Stop at Westmount.

Electric Lighted Compartment Cars and Standard Sleepers for both points.

- ¶ The North Toronto route is over an hour faster and overcomes a long hill climb for the train out of Toronto, obviating any inconvenience and ensuring early arrival at Montreal and Ottawa.
- ¶ The roadbed has been improved till it is unexcelled in Canada.
- ¶ The equipment is "Canadian Pacific Standard," a synonym for the "best" and attentive porters, ensure efficient service.

For Sleeping Car Space, Tickets, etc., Apply—

Toronto City Office: 16 King St. East, North Toronto Station, King Edward Hotel, West Toronto Station, or write M. G. Murphy, Dist. Passr. Agent, Toronto.

McAvity Improved Standpipe

Type G.

The McAvity Type G Standpipe, by its greater range of drop pipe, meets all requirements where different heights of tenders are in service. It is a combination of the Standard Sheffield Valve with carefully designed upper works. The telescopic delivery spout excels all other such arrangements in strength, simplicity and convenience in operating.

As there is no internal mechanism whatever in the McAvity Type G Standard, it is adapted for use in the coldest climate. Locks automatically and positively parallel with track when not in use.

Will revolve in complete circle. Operated by one man. Self-draining; cannot freeze. It is equipped with an automatic relief valve and water hammer is eliminated.

Prices on Application.

TESTED

To prove that the circulation is perfect in the

ROBB-BRADY SCOTCH BOILER

four thermometers were placed in oil wells to show rise in temperature as the boiler was fired up.

When the upper thermometers indicated boiling point, the lower thermometers rose rapidly. At 100 pounds pressure all four gave the same reading. No dead water beneath the furnaces.

It gives, in plants ashore, the same high economy and satisfactory operation that the standard Scotch type gives in marine service. It has three advantages over the marine type:

Rapid Circulation which keeps the heating surfaces clean for rapid and efficient steaming.

Cylindrical Combustion Chamber which does away with crown bar and girder stays.

Two Drums which may be made of thinner steel, reducing cost.

Turbines and Turbo Pumps, Blowers and Compressors. 39-39

More Miles Per Ton of Coal

A clean boiler is inexpensive to maintain, as well as economical to operate.

Dearborn Feed Water Treatment insures better steaming locomotives in bad water districts. The treatment loosens up old scale, so that it is easily washed out, and prevents new from forming. This means a saving in fuel consumption, an increase in mileage between boiler washings, and the elimination of leaks and repairs caused by bad water.

Dearborn Treatment is based on analyses of waters from the various sources of supply, thus enabling us to determine and neutralize all the harmful elements with scientific certainty, preventing pitting, and foaming, as well as scale.

The process is exact, the results sure, and the cost is lower per thousand gallons than any other method of treatment.

THE LESSON

taught by this widespread use of Pay-As-You-Enter Cars is obvious. Increased Revenue, Accident Elimination and Schedule Improvement have been demonstrated in every case. Isn't all this sufficient to show that it always pays to operate the Pay-As-You-Enter Car? Why not remodel some of your present cars?

We license manufacturers and railways to build and use the Pay-As-You-Enter Car, the Patents on which are owned by

The Grand Trunk Railway's Practice in Machining the Stephenson Link Motion.

By Frederick H. Moody, B. A. Sc.

At the G.T.R. Point St. Charles shops, Montreal, the process of machining a complete link motion has been developed to a nice degree, many simple labor-saving jigs which not only facilitate but improve the quality of the work, have been introduced, so that today the process is rather unique in its simplicity and thoroughness. The process outlined in this article has been developed step by step by the machine shop foreman, through whose assistance the following information has been obtained.

The Stephenson link motion is rapidly falling into disfavor as compared to the simpler Walschaert gear, but its use is

cast iron in two sections divided in a plane through the centre of the driving axle on which the sheave is to be mounted. The first machining operation is that of planing both sides in a shaper, each section being machined independently to the same thickness. Following this, the mating face of the small section of the sheave is tongued to fit a corresponding groove of the mating surface of the larger section. The two sections are next drilled perpendicularly to the contact faces on each side of the driving axle opening. This is performed in simple jigs. The holes in the smaller section are tapped to receive studs which

from the fact that where the sheaves are produced in sets of several at a time, no time is lost in setting up, all that is necessary being to slide the sheave on to the jig block, key and clamp.

The only remaining operation on the sheave is that of drilling two holes for the pinch or set screws which keep the sheave from travelling along the shaft. For this operation, one surface of the sheave is scribed in chalk as shown, in a line through the bosses in the cored cavity of the larger section; and when the sections are parted, by setting up in the drill press to this scribed line, the two holes are drilled and tapped for the

Fig. 1. Standard G.T.R. Stephenson Link Motion for a Pacific Type Locomotive.

still sufficiently great in new equipment to warrant a description of the process of manufacture, more for the value of the methods and processes used than from the fact that it is to be extensively used in the future. So long as existing locomotives equipped with the Stephenson motion require repair and renewal of parts, just so long will it be a matter of interest to those responsible for its production in the shop.

The motion selected as an example of the method of procedure, is that which is standard for Pacific type locomotives of classes ACEFP, the commonest example of this lot being that series of locomotives commonly called the 900 class. Such a motion is shown assembled in fig. 1. It will be noticed that it has been the aim throughout to keep the parts standard as far as possible, so that the factor of fitting new parts in the event of renewal is reduced to a minimum. This is emphasized by the fact that the one gear is applicable over such a range of types. It has been with this standardizing object in view that the ways and means outlined in this article have been devised.

THE ECCENTRIC SHEAVE shown partially finished in fig. 2, is made of

pass through clearance holes in the larger section, clamping nuts in the cored cavity of this section holding the two parts together.

After clamping together, the next operation is that of boring the driving axle opening by chucking in a lathe, centralizing and boring in a manner familiar to all. Following this comes the operation of slotting a keyway centrally in the bore of the large section. The next operation is rather interesting, being that of turning the outside for the strap fit, and giving the correct amount of throw. This is performed in the manner illustrated in fig. 2. A cast iron block of the driving shaft or axle diameter, is bolted to a small faceplate in an engine lathe, this block being adjusted in location to give the required throw. A keyway in this block is set in a line through the two centres of the lathe and block, so as to correctly engage the keyway of the sheave. The jig block thus mounted and adjusted is ready to receive the sheave, which after being keyed, is clamped to the lathe faceplate for turning to gauge or to an old strap. The value of such a rig lies not so much in its ability to produce a single sheave more rapidly, but rather

set screws to be entered from the cored cavity end.

THE ECCENTRIC STRAP shown in the assembled view, is made in two sections, parted through the centre in the usual manner, and held together by bolts through the projecting flanges. The eccentric rod is attached from a projecting lug of one of the sections.

The first operation is that of milling the engaging surfaces to fit together. Following this comes the operation of drilling the clamping holes, and babbitt and oil holes in the inner face. The method of doing this alone, with jig and tool used, was described in Canadian Railway and Marine World for February last. Briefly, the method is as follows: On the vertical face of a radial drill table, a jig, carrying a plate free to revolve, is mounted. On this plate, contact faces uppermost, a half section of the strap is clamped, the revolving disc being so mounted for the first operation as to have the contact faces level. A drilling gauge, consisting of a steel plate formed to the inner contour of the sheave, with ends projecting over on to the bolting flanges of the sheave, is dropped into position. In the level position, the bolt holes are drilled through

drill bushings held in the jig plate. Subsequent to this, the carrying plate is swung around an amount sufficient to bring the jig holes for drilling the babbitt recesses into a level position, this position being obtained by placing a level on the drill bushing in each position as it is required to be levelled up. In this position the revolving plate is clamped, and a shallow hole drilled, this being followed by a recessing tool so designed as to have the cutting edges spread at the ends after entering the hole, recessing the hole to form a retaining collar all around for the babbitt later poured into these spots. Both halves of the strap

shape shown, has a pin projecting inward from the downwardly projecting end. This pin, rounded on its inner end, forms a stop against which the jig block is drawn. In this position the holes are drilled, the holes being exactly located with regard to the finished interior of the strap. With the jig used in this manner, the time of laying out the holes is saved, and at the same time, the holes are drilled absolutely accurately.

THE ECCENTRIC ROD is a wrought iron forging, with the forked end solid. The first operation consists of milling the surfaces all over, on the completion of which the pin hole through the jaw end

of the block B, (the same block as that shown at A in fig. 3). These plates project down from the sides and end over the sides and end of the butt, thereby locating it centrally and true with the locating end. Clamped in that position the bolt holes are drilled. As in its former use, it is reversible for drilling either right or left hand butt ends by merely turning over, the side and end plates projecting above and below the surfaces of the gauge.

THE RADIUS LINK as it reaches the machine shop, is a solid forging roughly shaped to size. In the first place, it is surfaced off on both faces on the planer

Fig. 2. Turning an Eccentric Sheave on Special Mandrels.

Fig. 3. Jig for Drilling Holes for Eccentric Rod Butt.

are drilled with the same jig and tool. Following this, the cupped holes are poured with babbitt. These babbitt spots are shown in fig. 3.

Next in order comes the bolting together of the sections prior to the boring; this is the operation immediately following, and is performed in a usual manner by chucking in a lathe.

Machining the recess for the eccentric rod butt follows. The cast opening in the projecting butt lug, is relieved at the inner end by a cast channel so that the cutting tool relieves itself at the end of the cut and is not forced up against a

shoulder. This machining is performed in a planer or shaper. Drilling the bolt holes for attaching the eccentric rod butt is accomplished in the manner indicated in fig. 3, a rather novel jig being used for the purpose. A block of steel, A, containing bushed drill holes of the correct size and in the proper location, fits snugly into the machined recess for the eccentric rod butt. The jig is reversible, for the bushes are chamfered for the entry of the drill from either side. Through this block, there are two $\frac{1}{2}$ in. holes, into which pins projecting from the lower surface of the block B fit snugly. The arm, C, of this block, formed to the

shape shown, has a pin projecting inward from the downwardly projecting end. This pin, rounded on its inner end, forms a stop against which the jig block is drawn. In this position the holes are drilled, the holes being exactly located with regard to the finished interior of the strap. With the jig used in this manner, the time of laying out the holes is saved, and at the same time, the holes are drilled absolutely accurately.

THE ECCENTRIC ROD is a wrought iron forging, with the forked end solid. The first operation consists of milling the surfaces all over, on the completion of which the pin hole through the jaw end

shoulder. This machining is performed in a planer or shaper.

Drilling the bolt holes for attaching the eccentric rod butt is accomplished in the manner indicated in fig. 3, a rather novel jig being used for the purpose. A block of steel, A, containing bushed drill holes of the correct size and in the proper location, fits snugly into the machined recess for the eccentric rod butt. The jig is reversible, for the bushes are chamfered for the entry of the drill from either side. Through this block, there are two $\frac{1}{2}$ in. holes, into which pins projecting from the lower surface of the block B fit snugly. The arm, C, of this block, formed to the

shape shown, has a pin projecting inward from the downwardly projecting end. This pin, rounded on its inner end, forms a stop against which the jig block is drawn. In this position the holes are drilled, the holes being exactly located with regard to the finished interior of the strap. With the jig used in this manner, the time of laying out the holes is saved, and at the same time, the holes are drilled absolutely accurately.

Reference to fig. 4, will show that the drill jig is the same one as that used for drilling the eccentric strap butt, so that the bolt holes are certain to match up correctly. Thin plates, A, as shown, are attached to the sides and one to the end

machined in pairs. The construction of the attachment is very simple. On the end of the platen guides, there is attached an extension bracket A, centrally located and in line with the platen guides. On the bed, B, of this bracket, there is a plate, C, the upper surface of which has guiding ways for the carriage, D, adjustable lengthwise by means of the screw attached to the end of rod E with a handle at the outer end of the attachment. The carriage D, has a pin projecting from its upper surface carrying the clamp block F. This clamp block secures a slotted rod, G, which is rigidly attached at its inner end to the miller platen. In operation, the outward and

circular feeds of the miller are disengaged, and only the cross feed employed, the whole platen swinging on the centre pin of the attachment, the platen carriage adjusting itself thereto. Adjustment for locating the milling cutter for the successive cuts on the different edges, is made through the screw on the end of the rod E. The inside edges of the link are open to machining by milling, from the fact that the clearance holes at the end have been previously drilled and slotted. The correct radius is set from the pin on the carriage of the attachment. Following this the oil holes are drilled.

connecting rod of variable length from the power driven wheel, G, on which any throw of the crankpin may be obtained. The oscillating arm is guided in its movements by the supports, H, between which the arm moves vertically. In the foreground stands the standard grinder, driven from above. The feed, however, is derived from the oscillating arm drive through the train of gears, I, making the speed and feed interdependent.

The oscillating arm and supporting carriage are first set to give the correct radius. The link is then approximately attached as previously mentioned, when, by trial, it will be found that while the

shape so that it will sit without support, is placed. A form of surface gauge, C, adjustable in two directions, is held against the pin of the saddle on its V shaped base. Each edge of the V shaped base has a small projecting pin, forming the gauge support on the shoulder of the saddle. The arms of the surface gauge are adjusted so that the point just scrapes the top of the straight edge when pressed against the saddle pin and resting on the saddle shoulder. The gauge is swung out in turn to each end of the straight-edge, any error being noted. The straight-edge is then moved across to the other end of the link and this same

Fig. 6. Grinding to Radius the Inner Surfaces of the Link.

The next step is to file the link all over, preparatory to the case-hardening process to which it is subjected on the completion of the filing. The case-hardening tends to warp the link, requiring a subsequent straightening under a press. This is followed by a grinding of both surfaces on a surface grinder. The holes for the eccentric rod pins are then lapped out, and case-hardened and ground bushings forced into them.

The final operation on the link is that of grinding the inner surfaces to a correct radius. A specially designed machine, the construction of which is

radial of the link and machine are the same (from the original setting), the centre for the link arc will probably be slightly above or below that of the oscillating arm. To remedy this, it is not necessary to loosen the link from its supporting plate. As previously mentioned, this plate A, pinned at B, projects back alongside of the arm C, (on the other side of the arm, so not visible). Set-screws, J, through bosses on the rear side of this arm, bear on the end of the plate A, adjustment for coincidence being there attended to.

THE SADDLE is made from a solid

process repeated. Any variation in height at these four tested points is compensated for by scraping the base of the saddle on the side or corner that will give the required correction.

Locating the saddle is the next operation to require attention, and the method of so doing is shown in fig. 8. This saddle must not only be located midway between the eccentric rod pin holes, it must also have the exact offset over the slot of the radius link. The saddle is first located as close to its correct position as it is possible to do so by eye. The next step is to locate the saddle over the link slot

Fig. 7. Testing the Saddle Base on the Link Surface.

Fig. 8. Locating the Saddle Correctly on the Link.

shown in fig. 6, in conjunction with a standard grinder which is likewise shown, performs this operation. On a plate, A, the link to be ground is mounted. This carrying plate, A, is pinned at B to a long slotted arm, C, an arm of the plate A passing back a couple of feet alongside. A stand, D, carries on its upper surface a carriage, E, adjustable along the top in guided ways. Through the centre of the carriage E, there is a pin on which plates F, for clamping the slotted rod C are free to oscillate. The clamp plates, F, are secured to the slotted rod in any position of the carriage E, by the handwheel in front of the carriage. The slotted rod is oscillated by a

forging, and after reaching the machine shop, is turned and milled all over to the form shown in figs. 7 and 8, where it is mounted on the link. In view of the fact that a great deal of wear comes on the pin, that part of the saddle is case-hardened and ground. Following this case-hardening of the pin end, the base is refaced in the lathe.

The next step is that of determining the alignment of the saddle with regard to the ground surface of the radius link to which it is attached. The method of doing this is shown in fig. 7. A saddle, A, is mounted into approximate position on the link. Near one end of the link, a triangular straight-edge, B, made this

Fig. 9. Machine for Finishing the Tumbling Shaft Arms.

to give the correct offset; this is done by the use of the plate gauge shown standing up against the saddle pin at A. The distance from the right hand edge of this gauge to the centre point of the upper end, is made exactly to suit the offset required. Putting this centering gauge under the saddle against a wall of the slot, and bringing the lathe centre hole of the saddle to fit over the gauge point, places the saddle in its proper location.

This having been accomplished, the centralizing of the link with regard to the eccentric rod pin holes follows. Two pins, B, fit into segmental bushings in the eccentric rod pin holes. These segmental bushings to hold the pins, are made in

three sections, in pairs, a wide range of these pairs being at hand for use with different sizes of pin holes. The set standing on the left end of the link is for use with larger holes. The lower ends of the gauging pins are tapered, with a corresponding taper in the bore of the segmental sections. The gauging pins are thus made solid, and perfectly central and in line with the eccentric rod hole. A gauge, C, corresponding in construction to a height gauge, placed between the saddle pin and gauging pins in turn, locates the saddle in its central position. When thus located correctly, with regard to the two determining factors, the link and saddle are clamped together and the two bolt holes in the saddle drilled through the previously drilled holes in the link.

LINK BLOCK.—From the fact that the link block is such a small member, it is made in sets of four from a forged wrought iron block. This wrought iron block is first planed on its flat surfaces, and then drilled to gauge with four holes for the rocker shaft connection. Following this, the block of four is milled to the required radius on the rig shown in fig. 5, previously described. The drilled holes are the determining points from which to set the block up in the machine. The four pieces are then cut from the block. Both planed sides are then faced off in the lathe, concentric with the drilled holes, to form bosses on each side, over which the retaining collars fit. After drilling the rivet and oil holes, each block is case-hardened, followed by lapping out the central hole and a grinding of the arc surface of the blocks in the radius grinding machine. This completes the link block up to the stage of assembling.

THE LINK BLOCK PLATES are made from thin forged blocks, faced on a milling machine and bored in a lathe, one at a time. The large edge radius is given the plates by mounting them 12 at a

forging. The first operation is that of turning the body for the end journals, these turned ends acting as guiding points from which the balance of the machining is done. Slotting the faces of the bosses follows, gauging from the finished surfaces of the journals.

Next in order comes the boring and reaming of the two lifting link arms, the reach rod arm and the spring arm in the machine shown in fig. 9. The shaft is held between centres, A, mounted on the stands B, across which the centres are adjustable. The stands, B, are attached to a surface plate base, C, and may also be adjusted to suit the size of the piece being machined. The arms to be bored and reamed are centred by set screws top and bottom in the steadying castings, D, bolted to the base C. The first operation after correctly aligning horizontally and vertically, is that of drilling the bosses. A drill rod held in the chuck E, is guided in a bushing in the support F, against

the first boss. Stand G guides the drill rod for the second boss. There is also a third support at H.

The second or reaming operation, is performed by the reamer rod I, held in the chuck E, and guided into the drilled holes by the supports. The outside of the boss ends are turned by the use of a cutter head, J, mounted on a guiding bar. Following this, the previously slotted boss faces are faced off by a facing cutter through the cutter bar as at K. The reach rod and spring arm bosses are machined in a similar manner.

After removing from the special machine, the metal on the boss opposite the arm, which could not be removed by the cutter head, is slotted off by standing the bosses on end over centres in the slotter. Ground bushings are then forced in to the holes in the reach rod and spring arms. Likewise, the lifting link pins are ground into their arms and there set, completing the machining of

Canadian Northern Railway Ten Wheel Superheater Locomotives.

Within the past few months the Canadian Northern Ry. has received 20 ten wheel locomotives from the Montreal Locomotive Works. Though of moderate weight, these locomotives are of more than ordinary interest, because of the number of features presented in the design which are said to be new on Canadian railways and which are quite a radical departure from present practice.

Among these will be noticed the arrangement of steam pipes connected to the cylinders outside of the smoke box; the so-called self centering guide for the valve stem crosshead and the guide for the extended piston rods. All of these have been quite widely adopted on United States lines. These same details

heated steam is used. A much better joint to the cylinders is also obtained; as eight bolts of equal length with a symmetrical circular flange are used in place of four or six bolts, as in the case of the bent inside steam pipe. Should a small leak occur, this arrangement also prevents any injurious effect on the steaming of the engine. A leak would merely waste steam, but would not interfere with the vacuum in the smoke box, as it does in the case of ordinary inside steam pipe construction.

One of the principal advantages of the design of valve stem guide lies in the fact that it can be erected, taken down and replaced without lining up, at the same time insuring that the guide is absolutely

Canadian Northern Railway Ten-Wheel Superheater Locomotive.

time in a miller and running over the edges with a formed cutter of the correct shape. After drilling the rivet holes, they are case-hardened, followed by a surface grinding which leaves them ready for rivetting to the link block, four rivets being required.

THE LIFTING LINKS are also wrought iron forgings. The first machining is that of facing the four faces on the miller to give the necessary surfaces from which to work. Both ends are then drilled to jig for the insertion of bushings. Following this, the link is milled all over, including the round ends and flat sides, completing the machining by drilling the oil holes. Hardened steel bushings are then ground and pressed into the drilled ends, this operation being followed by a facing off of the first-milled surfaces by a cutter on a mandrel working in the hardened bushings.

THE TUMBLING SHAFT is a built up

were applied to 20 heavier 10 wheel locomotives constructed by the same builders for the C.N.R. in 1911.

One of the accompanying illustrations shows an arrangement of the outside steam pipes similar to the one here employed. An air tight joint is provided where the steam pipes are carried out through the smoke box. This arrangement removes much of the obstruction to draught in the smoke box which is present with steam pipes of the ordinary construction. It also eliminates the live steam passages in the cylinder saddle, thereby greatly simplifying the coring of the cylinder. This also reduces any tendency of cylinders cracking in service, due to the difference in temperature between the live steam and the exhaust steam passages which exists in the ordinary cylinder construction where the two passages are side by side. This is of special importance where highly super-

in line with the centre of the piston valve chamber. This device consists of a guide made integral with the back head of the valve chamber. It is consequently self-centering and is also self-supporting, no bracing from the crosshead guides or any other source than the cylinder being required. The guide is so designed as to be easily adjustable for wear. Liners are provided on the top and bottom, which in case of wear, may be removed or inserted as may be required. This arrangement makes it possible to use a straight design of combination lever without forks which is connected to the crosshead by a pin passing through the wings of the latter. This affords more lateral stability than is provided in other designs.

In the design of guide for the extension piston rod, the self centering principle is also employed. As a result, the guide can be removed and replaced without requiring lining, and at the same

time its axis exactly coincides with the longitudinal axis of the cylinder. It also provides ample wearing surface to insure long service without requiring adjustments. The general construction of this device is shown in one of the accompanying illustrations. The guide is so constructed that it is bored out and faced off at one setting on the machine. Its circular face registers with a corresponding face on the front cylinder head and the surface of the guide is struck from the centre of the cylinder. The shoe fitted to the extension of the piston rod has a radial bearing on the guide. Consequently, any refinement in adjustment between the piston rod shoe and the main cross

A. design. This arrangement employs a top-header and superheater pipes of the double loop construction. It is arranged to give a high degree of superheat and provides a superheating surface of 279.6 sq. ft. Because of the use of superheated steam, a low boiler pressure of 170 lbs. is employed. The boiler, however, is designed to stand a pressure of 200 lbs. The brick arch is supported on studs.

Following are the principal dimensions of the locomotives:—

Fuel	Soft coal
Weight on drivers in running order	112,500 lbs.
Weight on truck in running order	41,500 lbs.
Weight, total of engine in running order	154,000 lbs.
Weight of tender in running order	123,400 lbs.
Wheel base, driving	13 ft. 6 ins.

C.N.R. Locomotive. Piston Crosshead Guide.

head is unnecessary because, while the latter works in a flat guide, the former will swing around on the centre of the cylinder so that it will always take a fair bearing without cramping. The guide casing is open at the top, with a corresponding opening in the flange; so that the guide can be easily removed, if the engine is on the forward centre, without taking down the pilot and bumper. It is provided with a dust tight top and cover and with oil stops; so that the shoe always runs in oil. Experience with this device, covering nearly two years on a large railway in the northwest of the

Wheel base, total engine	23 ft. 10 ins.
Wheel base, total engine and tender	52 ft. 8 ins.
Tractive power, maximum	243,000 lbs.
Adhesion (factor of)	4.63
Cylinders, diameter and stroke	20 in. by 24 in.
Valves, type of gear	Walschaert
Valves, diameter	12 in.
Greatest travel	5½ in.
Lead in full gear	3-16 in. lead constant
Driving wheels, diameter outside tire	57 in.
Driving journals, diar. and length	8½ in. by 10 in.
Main crank pin journals, diar. length	6 in. by 6 ins.
Side rod crank pin journals, diar and length	6½ in. by 5 in.

F. H. B. journals	4½ in. by 3½ in.

Tubes, diameter	2 in.
Tubes, length	13 ft. 2¼ in.
Flues, material	Kewa seamless steel
Flues, number of	18
Flues, diameter of	5½ in.
Flues, spacing of	6¼ in. and 6½ in.
Heating surface, tubes, ...	1,241 sq. ft.
Heating surface, firebox	141 sq. ft.
Heating surface, total	1,382 sq. ft.
Superheating surface (on basis of inside diar. of superheater pipes)	279.6 sq. ft.
Grate area	29.2 sq. ft.
Exhaust pipes	Ry. Co.'s standard with single nozzle
Exhaust nozzle	4¾ in.; 5 in. and 5½ in.
Smoke stack, diameter inside	16 in.
Tender wheels, number of	8
Tender wheels, diameter	33 in.
Tender journals, diar. and length	5½ in. by 10 in.
Tender wheel base	17 ft. 10 in.
Tender frame	13 in. cen. and 10 in. outside channels
Tender trucks, type	Ry. Co.'s 4-wheel pedestal type
Tank, kind	water bottom
Tank capacity	5,000 imp. gals.
Tank, coal capacity	10 tons

G. G. Hare, Assistant Engineer, Dominion Atlantic Ry., Kentville, N.S., writes:—"I enclose renewal order for my subscription to Canadian and Marine World. Please forward me the July and August numbers, which I have not received, owing to my removal here from Kingston, Ont., so that my file of your valuable publication may be complete."

Removing and Repacing a Wrecked Timber Truss Span on the C.N.R.

The clearing of a wrecked timber truss span and erection of a temporary structure, restoring traffic, was accomplished in three days on the Canadian Northern Ry. at Saskatoon, Sask., where a derailed car demolished the north shore span of the bridge over the South Saskatchewan River. This bridge consists of six 150 ft. through Howe truss spans of timber on concrete piers, the rail elevation being about 45 ft. above the surface of the water. The bridge was of Pacific Coast fir in first class condition. It was built about six years ago.

As one of the southbound through passenger trains, carrying several sleeping cars on its rear end, was pulling through the south end of the yard at the approach to the bridge on March 4, the rear truck of the last sleeper left the rails at a switch about 500 ft. north of the bridge. The truck slewed and led off on the switch to the west or right hand side until the wheels that should have been on the left hand rail were over a foot outside the right hand rail and beyond the guard timber. There was a 30 ft. approach trestle, but the wheels were hanging over the ends of the ties when this was reached, so the guard rails could have no effect. The sleeper was dragged in this position on to the bridge, sideswiping the truss and breaking or knocking out the posts and diagonals. This span collapsed completely, falling with the last car to the river bed below, which was almost dry and frozen to the bottom. The damage to the bridge did not extend beyond the first pier and the car preceding the one which wrecked the truss remained on the structure, having its rear badly damaged, however. Fifteen passengers were in the rear sleeper, and 12 were injured, but none fatally. A fire started in the wreckage, but was quickly put out by the city forces.

The wreckage of the truss and the car was cleared away with the aid of a Lidgerwood ballast unloader, which dragged it sideways off the bridge site. A track which runs west along the river bank at right angles to the bridge was utilized for this purpose, the Lidgerwood car being set at the point marked A on the photograph of the reconstruction.

The cable was then run down to the wreckage, dragging the tangled mass of rods and timber and the wrecked sleeper out of the way.

Reconstruction was started by first erecting a temporary trestle over which traffic could be opened. Bents were framed on the ice and raised by a wrecking crane working outward from the shore end, blocking being put under the bents. On account of the end of the second sleeper overhanging the adjacent span, it was necessary to build entirely from the shore, so that the crane could be used to lift the overhanging car. The last two bents next to the pier were framed at the side of the bridge, then lifted clear and swung into place. When all but one panel of the trestle was decked, the crane lifted the end of the hanging car and pushed it forward on the undamaged part of the bridge.

With traffic thus restored, work was continued on the erection of the permanent Howe truss span, utilizing the trestle for falsework. Additional posts were placed vertically on the end of each sill to carry the weight of the new span.

The nature of this accident was such that it was believed to be unpreventable by the guard rails, and it is also believed that a steel structure would have suffered similarly.

The clearing of wreckage and re-erection of the span was done under the direction of J. A. Crawford, Bridge and Building Master, C.N.R. at Saskatoon.

C.N.R. Locomotive. Arrangement of Outside Steam Pipes.

United States, indicates that the wear on the shoe and guides in two or three years will not exceed 1-16 in. This obviates the necessity of relining between general shoppings. In view of the general use of extended piston rods on superheater locomotives, this device represents an important improvement in locomotive construction.

In the boiler construction, the principal features of interest are the superheater and the brick arch. The superheater is the Locomotive Superheater Co.'s type

National Transcontinental Railway Terminal Facilities at Moncton, N.B.

The National Transcontinental Ry. has under construction the facilities for its eastern terminal at Moncton, N.B., where it connects with the Intercolonial Ry. for St. John N.B., and Halifax, N.S. The trackage at present contemplated amounts to 10.6 miles, with room for the laying of an almost equal number when the demand arises.

The extent of the terminal, with its various auxiliary buildings, may be judged from the accompanying plan of the yard layout. The yards, with approaches, are over a mile long, and are located one mile from the point where the line joins the I.R.C., or about 1¼ miles from Moncton station. It is but a short distance from the I.R.C. new shops. The yards are located on a slight grade of 0.2088 ft. per hundred, rising from east to west. The eastern, or Moncton, end is 79.10 ft. above mean high water mark, and the western end, 87.45 ft., meaning a total rise in the length of the yard of 8.35 ft.

The yards are all to be north of the through main line, as it is expected that the trackage that can be placed there will prove ample for some time. To the south, it will be noticed, there is a strip the length of the yard which it is intended at some future date to convert into storage tracks, with a possible diversion of the main line to the south of this larger yard. The present storage capacity amounts to 600 cars, and the newer yard addition will add room for 600 more.

The main line along the south side of the property is located 18 ft. centres from a parallel track, the western end of which is used for caboose storage. Parallel with this, there is another through running track connecting with the caboose track through cross overs at the eastern end of the caboose storage space. To the north of this, at a 14 ft. spacing, there are nine through storage tracks leading from a 1 in 6 ladder track from the second track at the west end, and into a similar ladder at the eastern end, except for the lower three, which converge before leading on to the ladder, made necessary by the curve of the main line at that end of the yard. The first

The roundhouse and machine shop, located at the end of the car repair tracks, is of standard type, being erected along both the N.T. Ry. and the Grand Trunk Pacific Ry., and is shown more in detail in the plan of the standard layout. The same roundhouse and shop are used at this point, the layout being reversed, which is the only difference. The one to be built here will have 12 stalls, but it will be noticed in the yard plan that space has been left for a future addition, for

Between the had order tracks and the upper through running track, there are three leading from the west from the same ladder as the upper running track at a 19 ft. spacing. The middle one of these from the west leads on to the coaling trestle, from which the chutes are supplied. The two outer tracks are for coaling the tender. Further east on the same tracks are the ashpits, both tracks converging from that point on to the turntable. From the turntable east, there is only a single track leading parallel to the ladders to the main line.

The engineering difficulties in the way of locating the yard were considerable, and careful planning was required. The

Standard Divisional Roundhouse and Shops for National Transcontinental Ry.

which the design of the shop layout is planned to accommodate. A 75½ ft. turntable serves the roundhouse, the inner posts of which are at a 110½ ft. radius. The roundhouse is 87 ft. deep. The upper nine of the stalls have no special fittings, but are constructed of concrete, the floor edge and the forward end planked. The three lower stalls have a drop pit connecting the three, with the centre track leading through into the

yards could not be located in Moncton from a lack of suitable space. Likewise, it was impossible to place the yards very close to the city, from the fact that the track rises out of Moncton on a 0.6% grade, which is rather too great for an extensive yard. The nearest place where a nearly level yard could be built, was the present site, 1¼ miles from town.

The contour lines of the original ground formation are shown on the yard

Yard Layout and Shop Arrangement for National

track north of these storage tracks is an open running track, connecting with the main line at both ends through a separate track parallel to the end ladder tracks. At both ends, there is a short parallel track, the one at the eastern end being used for caboose storage for traffic made up to travel in the opposite direction to that for which the west end caboose track is placed.

The upper ten tracks, at a 20 ft. spacing, entered by a separate 1 in 6 ladder track from the west, are for repair and bad order cars, conveniently located to the shops. Parallel with the ladder, near the west end, there is a short track for the wrecking outfit, which is handy to the main line on to which it can be run without any intermediate interference from blocked tracks.

machine shop to the rear. The machine shop in turn communicates with the blacksmith shop, which has an intervening wall, an optional construction being the elimination of this wall. An industrial railway connects the shops, leading out into the yard to the rear, where the bad order tracks are located. The engine room, boiler room, coal house, pump room and hot well adjoin this building. One of the bad order car tracks leads in alongside of the coal house for the coal supply. The fan room, along the outer wall of the roundhouse, supplies hot air through a concrete duct buried along the outer wall, smaller ducts leading therefrom along the walls of the pits, with entries at short intervals. The shops also have a buried system of conduits for heating.

layout plan. Between the level at the location of the culvert under the tracks and that of the ground where the roundhouse is to stand, is a full 45 ft. At the east end, the final elevation is to 79.10 ft., necessitating the reduction of the 100 ft. level of the shop site and the filling in of the ravine, carrying the filling-in operation nearly to the western end of the yards, where the final level is to be 87.45 ft. The tracks on the western portion of the yard are all on made ground, but the shops are all on the higher levels that were reduced. Any settling of the fill will not affect the buildings. A very convenient arrangement of tracks and buildings has been obtained, considering the restrictions laid upon the engineers in the laying out of these yards.

All the work of filling has been com-

pleted, and track laying is in progress. The contract for the round-house has been let, and work is to commence in the near future. Tenders have been invited for the coaling trestle and the other buildings of the shop plan. The yard layout was designed at Ottawa, and the work carried out under the direction of the C. O. Foss, District Engineer, N.T.R., St. John, N.B.

Grand Trunk Terminals Warehouse Company Ltd.

Canadian Railway and Marine World for August contained some extracts from this company's prospectus, which contained the names of W. Wainwright, J. E. Dalrymple and R. S. Logan, three of the G.T.R. Vice Presidents, as directors. Just after the issue had gone to press, McCuaig Bros. and Co., of Montreal, who issued the prospectus, sent out the following notice:—

"Referring to the circular which we recently issued in connection with the bonds of the Grand Trunk Terminals Warehouse Co., Ltd., we beg to advise you that the composition of the board of directors as given therein is not as stated. While the G.T.R. reserved the privilege of appointing three out of the seven directors, they have so far not definitely decided whom they will appoint, although the directors as they appear in our circular were announced in the Montreal papers. Pending therefore a definite statement in this connection, we beg to advise you that we have withdrawn our circular in connection with the above company and would therefore ask you to cancel same."

It seems an extraordinary thing that a prospectus of a company should be prepared and names of directors inserted on the strength of a daily newspaper report.

Completion of the Atlantic, Quebec and Western Ry.

By the opening of the Atlantic Quebec and Western Ry. on August 1 to Gaspé Basin, the extreme eastern end of the Gaspé peninsula, in the Province of Quebec, has been given the railway

The whole route from Matapédia to Gaspé is most picturesque, with a charming variety of scenery, embracing the Baie de Chaleur, the Gulf of St. Lawrence and Gaspé Bay and the wooded mountainous country reaching back from the shores, which offers great attractions to tourists, to salmon and trout fishermen and for moose and caribou as well as a variety of bird shooting.

The train dispatching on both lines is done from New Carlisle by telephone, and it is said that the line now operated as the Quebec Oriental Ry. was the first in Canada to equip its trains with portable telephone apparatus.

Superheated Steam in Locomotive Service.

The conclusions arrived at concerning the use of superheated steam as obtained in a series of experiments reported in the University of Illinois Engineering Experiment Station bulletin 57, may be summarized as follows:—

Superheated steam may be successfully used in locomotive service without involving mechanism that is unduly complicated or difficult to maintain.

Evidence points to the fact that the various details of the locomotive that come in contact with the highly superheated steam give little trouble as regards maintenance, and are not among the members usually most in need of repair when the locomotive is shopped.

Superheating materially reduces the consumption of both water and fuel, and increases the power capacity of the locomotive.

The locomotive tested had boiler and superheating surface of 943 and 193 sq. ft. respectively, superheating approximately 150 degs. The superheat decreases with increased boiler pressure, and vice versa, in the following relation:—

$$T=123-0.265P+7.28H$$

where T is superheat, P the boiler pressure, and H the equivalent evaporation per foot of water-heating surface per hour.

The evaporative efficiency of the boiler and superheater is

$$E=11.706-0.214H$$

where H is the equivalent evaporation per hour per foot of water-heating and superheating surface.

Absorbed by steam in superheater	5%
Total utilized	57%
Lost in vaporizing moisture in coal	5%
Lost in CO	1%
Lost through high temp. of escaping gases	14%
Lost in form of sparks and cinders	12%
Lost through grate	4%
Lost through radiation, leakage, etc.	7%

The water consumption under normal conditions of running for boiler pressures of 120, 160, 200 and 240 lbs., respectively amounts to 23.8, 22.3, 21.6 and 22.6 lbs. per i.h.p. per hour.

The coal consumption under normal conditions of running at the following boiler pressures of 120, 160, 200 and 240 lbs., is respectively 3.31, 3.08, 2.97 and 3.12 lbs. per i.h.p. per hour.

Neither the steam nor coal consumption is materially affected by considerable changes in boiler pressure, a fact that justifies the use of comparatively low pressures in connection with the superheating.

Contrary to the usual conception, the conditions of cut-off attending maximum cylinder efficiency are substantially the same for steam superheated 150 degs. as for saturated steam. With superheated steam, when the boiler pressure is 120, the best cut-off is approximately 50% of the stroke, but this value should be diminished as the pressure is increased, until at 240 lbs. it becomes 20%.

Tests under low steam pressures for which the cut-off is later than half-stroke, give evidence of superheat in the exhaust.

The saving in coal between a saturated and a superheated locomotive varied from 18% at 120 lbs. to 9% at 240 lbs. The saving in water under the same conditions and between the same limits varied from 17% to 6%.

The power capacity of the superheating locomotive is greater than that of the saturated steam locomotive.

The above results are based on the results of a series of tests at the Purdue University Testing Laboratory conducted by Dr. W. F. M. Goss, and extending over a period of eight years, the locomotive tested being an eight wheel American equipped with a Cole superheater. Under four different pressures, 4,851 miles were run off during the experiments, so that the observations may be considered as being quite as accurate as experimental results can be.

Transcontinental Ry. Terminals at Moncton.

communication which has been looked forward to for so many years.

Starting at Matapédia, Que., on the Intercolonial Ry., the Quebec Oriental Ry., formerly the old Baie de Chaleur Ry. and subsequently the Atlantic and Lake Superior Ry., runs to New Carlisle 98 miles, from which point the Atlantic Quebec and Western Ry. has been built to Gaspé Basin, 104 miles, a total of 202 miles. A through train is now being run each way daily, except Sunday, between Matapédia and Gaspé Basin, both lines being under the general management of C. R. Scoles, who was the contractor for a considerable portion of the A.Q. and W. Ry., which is a well constructed line with some interesting engineering features.

The addition of the superheater to a boiler originally designed for saturated steam involved some reduction in the area of the heat-transmitting surface, but the efficiency of the combination when developing a given amount of power, was not lower than that of the original boiler.

The ratio of the heat absorbed per foot of superheating surface to that absorbed per foot of water-heating surface, ranges from 0.34 to 0.53, the value increasing as the rate of evaporation increases.

When the boiler and superheater are operated at normal maximum capacity, and when they are served with Pennsylvania or West Virginia coal, the available heat supplied is accounted for approximately as follows:—

Absorbed by water	52%
-------------------------	-----

The C.P.R. has transferred its local freight offices at Fort William, Ont., to a new building just above shed 5 on the Kaministiquia River.

F. G. MARTYN, Assistant Superintendent, C.P.R., West Toronto, writes:—"I feel quite justified in saying that Canadian Railway and Marine World is the best journal dealing with railway matters printed to-day. I wish it continued success."

During June, 13 employees were killed, and 23 were injured in the course of their work in connection with Canadian steam railways. Of the fatalities, five were due to collisions, three to being run over, two each to being crushed and being struck by trains, and one to a fall.

Canadian Pacific Railway Bascule Bridge Over Kaministikwia River.

A large bascule bridge is being built across the Kaministikwia River at Fort William, Ont., for the C.P.R. It is a combination bridge, for the handling of both railway and highway traffic, a lower deck with a double track providing for the railway requirements, while on an upper deck there are two street car tracks in addition to a roadway and foot-path on each side. The double deck feature in bascule bridge construction is said to be unique, and it is reported that there is no other bridge of the bascule construction containing a double deck that is quite as large, although there are

a solid mass of concrete, of such a weight as to maintain the weight of the main span in a state of equilibrium, the only power required to raise the span being that necessary to overcome the friction of the parts.

The operation of the bridge is rather unique. Pinned to the front of the towers on each side are operating struts, on the lower edge of which are long racks each engaging at the outer end with a pinion. This pinion is connected through gearing to an 85 h.p., 490 r.p.m. 550 v. 60 cycle motor fitted with solenoid brakes. These two motors are mounted on the towers,

from white to red, indicating that the bridge is closed to traffic. Similar changes in light occur on the operator's panel.

Until the end locks are withdrawn, the contactors of the operating motors remain open. When withdrawn, these contactors are closed, so that the operator can, as soon as the light signals that the time is proper, energize the main motors through the controllers. The first notch of the controller merely opens the solenoid brakes. This position can be used at any time when it is desired to coast. The starting of the span on its upward movement opens the lock motor contactors so that the latter cannot operate by accident.

The closing of the span is performed by the reversing of the operations out-

Bascule Bridge across the Kaministikwia River.

a couple of single deck bascule bridges under construction that are considerably larger than this one.

The Kaministikwia river, at the point where the railway crosses, has a clear channel of 125 ft., but as the line crosses the river at an angle, a clear span of 186 ft. is required. This leaves the channel perfectly clear when the lift is raised into the open position. The construction of the bridge is rather out of the ordinary, as an inspection of the accompanying illustration will show. The main span is pinioned on a main trunnion at the forward end of the triangular tower. On the top of this tower, a cantilever counterweight arm is trunnioned, the counterweight overhanging the right end of the bridge, the opposite end being connected by a connecting link with pins at both ends to a point along the lower part of the span member as indicated. As the main span swings on the main trunnion, the counterweight cantilever at the same time moves through a similar angle, as the pins are so located as to form a parallelogram. The counterweight on the outer end of the counterweight arm is

as indicated in the illustration. The motors, when operating, revolve the pinion, which moves along the rack on the lower face of the operating strut. This action lifts the spans. As the bridge moves up, the motors move through the same angle, which in the highest position is 80 degs.

At the outer end of the span there are two lock motors of 5 h.p. each at 810 r.p.m. on 550 v. 60 cycle. These operate the locks through worm gearing. There is also a 3 h.p., 3 phase 550 v. motor geared to a crank disc to operate the emergency brake.

When the bridge is closed and ready for traffic, the lock signal switch and the bridge signal switch are both closed, and the contacts in the circuits of the main operating motors and the lock motor are open. To open, the danger signal is first set. The action of so doing energizes the contactor points of the lock motor, causing them to close, when by the closing of the lock motor circuit breaker by the operator, the locks are withdrawn. The lock moving out automatically changes the light in the signal tower

lined, and the signal lights show up in the same reverse order. Air buffers are provided to take up any shock when the span strikes the abutments. If the bridge is travelling too fast, these air buffers will cause the motors to overload and trip the oil switch. The operators cabin, at the top of one of the towers, is fitted with a complete electrical control outfit, including switch board and the necessary attachments.

The structural steel work and mechanism were fabricated and erected by the Canada Foundry Co., Ltd., and the electrical equipment was furnished and installed by the Canadian General Electric Co., Ltd.

Railway Lands Patented.—Letters patent covering Dominion lands in Manitoba, Saskatchewan, Alberta and British Columbia, were issued during June, as follows:—

Railway Mechanical Methods and Devices.

Moulding Grease Cellars at the C.P.R. West Toronto Shops.

A special method of forming in moulds the locomotive driving axle grease cellars is in use in the C.P.R. West Toronto locomotive shops, A. Dixon, general foreman. The method used is shown in the accompanying four illustrations.

Customarily, the grease is moulded into the driving axle cellars in a piece-meal manner, packing the grease into

which is keyed to the trunnion shaft of the plunger shell, B, through which the latter receives its motion from the small air cylinder, E.

On the forward end of the hollow shell, B, there is a die-head, H, bolted thereto as fig. 2 shows. This die has an aperture through which the grease is forced, of the same shape and size as the section of the largest grease cellar that is required to be filled. The face of the die opening is machined off, and has projecting studs by which different sized apertures may be bolted on to give the

come from the machine on the supporting board, are placed on a table and cut up into short blocks of the required length to fit the grease cellars, into which they may be slipped without any further work. The blocks are cut off as before with a thin piece of sheet metal.

If, however, the correct size of grease forcing die to attach to the end of the trunnioned shell is not to be had through the fact that that particular size is not in sufficient demand to cause such a one to be made, or for any other reason one is not available, the next larger size is used,

Fig. 1. Grease Cellar Moulding Machine in Open Position.

Fig. 2. Grease Cellar Moulding Machine in Operation.

position as the work progresses. This method, while giving eminently satisfactory results, is slow, and requires careful work to give these good results. In consequence, it was considered that some purely mechanical method of forming them, if it were possible to devise such a scheme, would be much more preferable. The method outlined in this article is the result.

The moulding machine is shown in figs. 1 and 2. Trunnioned on a shaft, A, there is a hollow cylinder, B, bored the full length to the diameter of the plunger

different sizes of grease blocks that are required by various journals.

The operation of the machine is as follows: With the hollow cylinder, B, in its vertical position, as indicated in fig. 1, it is filled with axle grease—cleaned grease, scraps and new stock—this being lightly pressed down into the bottom. Turning the air handle, I, to the left lets air in behind the piston in the cylinder E, forcing it forward, lowering the shell B into the position assumed in fig. 2. The air valve, J, is next turned to the left, forcing the air plunger forward, entering the

and the surplus grease trimmed off in the manner indicated in fig. 4. A cut off block of grease is dropped into the cellar as indicated at A. Then, with a hammer, or any such convenient tool, the grease is forced down to fit into the cellar, as at B. This operation packs the grease into a solid mass, and is even freer from imperfections than the original die pressed block. Following this with a sharp edged bar of metal, the surplus grease is removed from the cellar, the circular forms in the end plates guiding the cutting tool through

Fig. 3. Blocks of Grease from the Moulding Machine.

Fig. 4. Moulding the Blocks Into the Grease Cellars.

head, C. This cupped plunger head, C, is attached to the end of a piston rod, on the other end of which is a piston in the air cylinder, D. Both the air cylinder D, and the plunger cylinder trunnion support, A, are mounted on a frame built up of channel sections, raised from the floor on bent bar sections, all as indicated in figs. 1 and 2. In the front channel, there is a small diameter air cylinder, E, containing a piston connected to the crosshead, C. This cupped plunger head, C, A short link from this crosshead connects with the lower end of the arm,

plunger head, C, into the shell, B, against the grease contained therein. By regulating the intensity of the pressure in this cylinder, D, the grease can be forced out through the forward end of the die aperture. A block some 3 or 4 ft. in length is forced out on to a board, and cut off with a piece of thin sheet metal. If the shell has been sufficiently charged, two or three such blocks may be cut off without reloading. The air handles are again reversed, bringing the machine back into the position in fig. 1.

These long blocks of grease, as they

the grease leaving the finished grease cellar in the form indicated at C.

The G.T. Pacific Ry. has put in operation a regular tri-weekly passenger and freight train service from Prince Rupert to Van Arsdol, B.C., in place of the mixed train heretofore operated.

D'Arcy Scott, Assistant Chief Commissioner, Board of Railway Commissioners, turned the first sod on the site of the Canadian Car and Foundry Co.'s new plant at Fort William, Ont., recently.

Repairing Air Hose at the Central Vermont Railway Shops.

In several previous issues of Canadian Railway and Marine World, various arrangements and devices in use in the different railway shops throughout the country for the never ceasing task of renewing and repairing air and steam hose have from time to time been described, especial emphasis being given to the fact

similar to the one to be found in the usual construction, and a vertical cylinder, B, under the table, N. On the table, N, there is a block, M, carrying a guiding casting, L, along which the lower half of the clamp C, is free to slide. The upper half of the clamp is suspended from the clamp lever K, one end of which is attached to the upper end of the plunger from the cylinder B, and fulcrumed near the centre on a standard L. The lower end of the standard L, fits a channel in the circular slide J, so that

Through a horizontal hole along the centre of the block M, the lower rod of the attachment E is slipped and attached to the block on the end of the plunger of cylinder A, in the hole near the lower edge. To the face of the block of attachment E, the permanent coupler is attached, to which the coupler of the hose to be repaired is connected, and after clamping as before, by the admission of air into the cylinder, the force on the hose is in the opposite direction, dismantling the end pieces from the hose. The clamping sections for the machine to replace the ones used in the mounting operation are those shown to the right at D. One end is removed at a time, the carriage being made stationary by the insertion of a pin through the part I into the carriage.

The machine as installed is shown in fig. 2. The different sized attachments for the steam and air hose may be noticed on the shelf below. To the left are the bins for the storage of the hose after completion, and they are also used to temporarily store the hose during the steps through which the hose passes in going through the machine. The control handles for all the valves are located conveniently for the operator in the front of the machine, as may be seen.

Heavy One-Piece Forging at the Montreal Locomotive Works.

A rather heavy forging to be produced in a single heat under the steam hammer is shown in the accompanying illustration of a locomotive connecting rod. The billet from which the rod was forged had a section 6 x 15 ins. The practice outlined, is that of the Montreal Locomotive Works.

The original dimensions at the large section of the rod, the right end in the illustration, were not altered appreciably. The 6 x 15 in. bar, heated through the required length to a bright red working heat, was brought under a large steam hammer, handling the hot bar by tongs from a hydraulic crane, by means of which the billet could be changed about under the stroke of the hammer. The right hand tip was first drawn down to the shape indicated, followed by a reduction of the body of the rod to the left, to the point where it was still attached

Fig. 1. Details of Machine for Mounting and Dismounting of Air Hose Connections.

that the number of such devices to be found would seem to be legion, each shop having a method peculiarly its own, with special advantages and disadvantages accompanying each. To determine the best one out of such a large selection would be a difficult task, as they have so many inherently good features, each one seeming to meet the particular requirements of the shop in which it is located.

The accompanying two illustrations show the arrangement as used in the

the upper clamp section can swing through an arc of about 90 degs.

On the face of a block at the left end of the table, the coupler piece is attached to corresponding coupler on that face, and on the plunger end there is the threaded hose nipple, and in the clamp, the hose is secured. Admitting air into the cylinder A, forces the plunger forward, forcing both nipples into the hose, the carriage C accommodating the hose to the new positions assumed as the nipples move further into the hose ends.

Fig. 2. Installation of Machine for Repairing Air Hose.

800 lbs. Forging Made in a Single Heat.

Central Vermont Ry. Shops at St. Albans, Vt. It is essentially the same as most of the others previously described, working with a series of air cylinders and guiding ways, with the one advantage that the attachments are so varied as to make it equally useful for all stages of hose renewal, the whole construction and operation being withal very simple. The details of construction are shown in fig. 1, and the machine as installed, in fig. 2.

Referring to fig. 1, it will be noticed that there is a horizontal cylinder, A,

For the fitting on and tightening up of the hose clamps, the attachment F, is slipped into vertical channels in the face of the member I. Forcing forward the block face of the plunger against the open jaws of this attachment containing an open coupler clamp, closes the latter tightly so that the operator can quickly screw up the clamping bolt. Both ends being the same as regards the clamp, can be fixed in a similar manner.

The machine has attachments also for the removal of old connection nipples.

to the original bar. All this was performed in a single heat, and yet the forging was still sufficiently hot at the expiration of the reduction to shape to make possible a further reduction were this necessary. This demonstrates the dexterity of the operator, W. W. Shackford, foreman hammersmith, who personally handles all the heavier and more complicated pieces of forging. Not only must the work be done quickly to make production in one heat possible, every move telling, but great skill is also shown

in the manner in which the forging is kept down to such dimensions as to make the machining as light and as uniform as could reasonably be expected.

On the completion of the forging on the end of the bar, it was cut off and allowed to cool, no further forging on the rod being necessary. The forged rod at this stage weighed 800 lbs. The production of rods in this manner in a single heat, and close to the required dimensions, as the rod illustrated, is common practice with this company, and represents everyday work.

Hook for Lifting Coach and Tender Wheel Centres at the C.P.R. Angus Shops.

The hook for lifting coach and tender wheel centres is an idea developed in the C.P.R. Angus shops, Montreal, where it is used in the tender department. In Canadian Railway and Marine World, for March last, the process of mounting and dismounting tires from the centres in this department of these shops was described, and if the process be recalled, it will be remembered that the steel centres

Hook for Lifting Coach and Tender Wheel Centres.

are placed flat on the floor and the heated tires slipped over them and allowed to cool in that position. In the placing of these centres in this manner on the floor, is where the hook device described herewith is employed.

The construction of the hook consists of two engaging arms, fulcrumed on bolts in two retaining distance pieces. Between these arms, and held in the same retaining pieces, there is a lifting hook, the lower end of which is tapered from the bottom upward so as to engage the side arms when drawn up. The lower parts of the side or engaging arms have the sides so formed as to be parallel when inserted in the bore of the wheel centre the hook is designed to lift.

To use, the lifting hook is allowed to drop into its lowest position, and the upper part of the engaging arms swung outward, permitting the entry of these hook ends into the wheel centre bore. Then, by swinging the tops of the engaging arms together and pulling upward on the lifting hook, holds the hooks under the lower face of the wheel bore. The crane chain is attached to the lifting hook. The advantage of such a lifting device lies in the fact that the centres do not need to be raised by the flanges and flopped over into location, but are placed in the desired position by lifting from the flat.

Birthdays of Transportation Men in September.

Many happy returns of the day to:—

G. W. Alexander, Local Treasurer, G.T.R. Western Lines, Detroit, Mich., born at Lightcliff, Yorks, Eng., Sept. 10, 1859.

H. Bailey, Bridge and Building Master, Dominion Atlantic Ry., Yarmouth, N.S., born at Huntsville, Ont., Sept. 2, 1879.

W. B. Bamford, Division Freight Agent, Atlantic Division, C.P.R., St. John, N.B., born at Belleville, Ont., Sept. 10, 1863.

W. D. Barclay, General Manager, Canadian Northern Quebec Ry., Quebec and Lake St. John Ry., Halifax and Southwestern Ry., and Inverness Ry. and Coal Co., Quebec, Que., born at Campbellton, N.B., Sept. 23, 1852.

G. T. Bell, Assistant Passenger Traffic Manager, G.T.R. and G.T.P.R., Montreal, born there, Sept. 7, 1861.

W. H. Biggar, K.C., General Counsel, G.T.R. and G.T.P.R., Montreal, born at the Carrying Place, near Trenton, Ont., Sept. 19, 1852.

E. R. Bremner, ex-Division Freight Agent, G.T.R., Ottawa Division, Ottawa, born at Toronto, Sept. 9, 1875.

M. H. Brown, Division Freight Agent, Ontario Division, C.P.R., Toronto, born at Victoria Square, Ont., Sept. 2, 1866.

W. G. Brownlee, ex-General Transportation Manager, G.T.R., Montreal, born at Lawrenceville, Ill., Sept. 9, 1858.

W. B. Bulling, ex-Assistant Freight Traffic Manager, C.P.R. Eastern Lines, Montreal, born there, Sept. 16, 1858.

C. F. Burns, Auditor of Disbursements, Intercolonial Ry., Moncton, N.B., born at Clements Port, N.S., Sept. 10, 1854.

A. D. Cartwright, Secretary, Board of Railway Commissioners, Ottawa, born at Kingston, Ont., Sept. 20, 1864.

A. W. Davis, Locomotive Foreman, G.T.R., Stratford, Ont., born at Sittingbourne, Kent, Eng., Sept. 5, 1864.

A. S. Dawson, M. Can. Soc. C.E., Chief Engineer, Department of Natural Resources, C.P.R., Calgary, Alta., born at Pictou, N.S., Sept. 6, 1871.

O. L. Dickson, President, White Pass and Yukon Route, Vancouver, B.C., born at Ottumwa, Ia., Sept. 16, 1877.

W. E. Duperow, General Agent, Passenger Department, Grand Trunk Pacific Ry., Vancouver, B.C., born at Stratford, Ont., Sept. 4, 1872.

W. H. Estano, Traffic Auditor, Intercolonial Ry., Moncton, N.B., born at Halifax, N.S., Sept. 29, 1874.

C. B. Foster, General Passenger Agent, C.P.R. Western Lines, Revelstoke and east, Winnipeg, born at Kingston, N.B., Sept. 30, 1871.

J. P. Ferguson, representing Galena Signal Oil Co., Ottawa, Ont., born at Drummondville, Que., Sept. 12, 1856.

D. W. Hatch, Travelling Agent, Atchison, Topeka and Santa Fe Ry., Montreal, born at Bedford, Que., Sept. 1, 1841.

J. E. Hutcheson, General Manager, Montreal Tramways Co., Montreal, born at Brockville, Ont., Sept. 15, 1858.

W. H. Kelson, ex-General Storekeeper, C.P.R., Montreal, born at Bath, Eng., Sept. 5, 1850.

C. B. King, Manager, London St. Ry., London, Ont., born at Galena, Ind., Sept. 12, 1871.

R. E. Larmour, Division Freight Agent, British Columbia Division, C.P.R., Vancouver, born at Brantford, Ont., Sept. 26, 1868.

E. W. Taylor, General Freight Agent, Reid Newfoundland Co., St. John's, Nfld., born at Carbonear, Nfld., Sept. 8, 1870.

Sir William Whyte, Director, C.P.R., Winnipeg, born at Charleston, Scotland, Sept. 15, 1843.

H. A. Young, Traffic Manager, Canadian Lake Line, Toronto, born at Brooklyn, N.Y. Sept. 1, 1864.

C.P.R. Station at Calgary.

The ground floor plan of the enlarged station at Calgary, Alta., shows a building with a total frontage of 514 ft., and a general width of 46 ft. In the centre there will be a general waiting room, 74 by 46 ft., with a vestibule on the street side along the whole 74 ft., from which there will be two stairways to the offices above. On the east side, immediately off the general waiting room, a corridor will run through to the baggage room, which will be 62 ft. long, and will have direct access to the street and to the track. On the street side of the corridor, leading out of the general waiting room will be the women's waiting room and retiring room; baggage-checking and baggage transfer offices and vaults, while on the track side, will be the smoking room, men's lavatories, room for trainmen, parcel office, and offices for the baggage master and customs officials.

The company's telegraph department offices are located in the recently built extension to the east wing. The west wing now under construction, which it is expected will be completed on October, has a frontage on the track of 226 3/4 ft. The ticket office immediately adjoins the general working room, and a corridor on the street side leads to a large luncheon room, pantry, etc. Beyond this is the express room, express office, and stairway to offices located on the first floor.

The central portion of the building was erected, but the eastern extension was then made, and the western extension is now being added. With the addition of this latter extension the central portion is being rearranged, so as to provide for the large general waiting-room. The entire building is of reinforced concrete with Calgary stone facing. Sharp and Co. Winnipeg, have the contract for the present addition.

The Canadian Northern Prairie Lands Co.'s sales during June amounted to 640 acres, realizing \$9,760, an average of \$15.25 an acre. To the end of June there remained unsold 69,240 acres.

THE DESIGN AND CONSTRUCTION OF LOCOMOTIVE BOILERS.

Report of American Railway Master Mechanics' Association's Committee.

Following is the report of the Standing Committee, of which D. R. MacBain, Superintendent, Motive Power, Chicago, Rock Island and Pacific Ry., was chairman, as presented at the association's convention at Atlantic City, N.J., recently:—

Your committee sent out a circular of inquiry to all the members of the association in regard to their experience and recommendations concerning construction of locomotive boilers. We received replies from 21 members, comprising a total of 22,900 locomotives, which is about one-third of the locomotives represented. The intention of the committee is to give the different members the benefit of the experience of the different roads.

TYPE OF BOILER.—In no case is a special type of boiler used for any special service. One of the members advises that they use Belpaire boilers of crown bar construction for road locomotives entirely on account of greater ease in maintaining staybolts. Another member advises that they use the Belpaire boiler as well as the radial stay boiler, and their experience with the Belpaire is that it reduces the number of staybolt breakages, which has been proved by the records of staybolt breakages. From the experience that they gained with Belpaire boilers they developed a system of cross-

few roads use it on narrow-type fireboxes. On the crown bar type of boiler it is found to be a hard matter to keep the crown bars free from mud, but in renewing fireboxes on this class of locomotive, beneficial results have been obtained by raising the crown bars and in-

Fig. 1. Boiler Bracing Embodiment Advantages of the Belpaire.

Fig. 2. Firebox Showing Great Economy in Fuel.

serting higher washers—1½ to 2 ins.

The committee was unable to get any data in regard to merits of Belpaire boiler compared with the radial stay boiler, as far as maintenance and boiler performance is concerned.

From the replies received from the different members it is the consensus of opinion that the radial stay type of boiler is preferred, as it is easy to construct, giving more free circulation of water, less deposit of sediment on the crown sheet and easier to wash out; also the dead weight is kept down considerably.

COMBUSTION CHAMBERS.—From the replies received the combustion chamber is only favored by five members. One member, who uses the combustion chamber covered by fig. 2, advises that it shows a great economy in fuel, a decrease in the amount of smoke, and cinders and increased mileage. No information was given in regard to maintain-

Fig. 3. Combustion Chamber with Low Maintenance Cost.

Fig. 6. Combustion Chamber Difficult to Maintain Tight Seams.

bracing, shown by fig. 1, which has practically all the advantages of the Belpaire staying, and in addition it reduces the

dead weight and is cheaper to construct. Crown bar construction is not used to any extent on wide firebox boilers, but a

ance. Another member advises that the reason they favor the combustion chamber in certain types of boilers, such as

The advantages claimed by the use of

Your committee feels that a combustion chamber is desirable on boilers with extra long flues, such as Mallet and Mi-

Fig. 7. Type fo Mudring Corner.

combustion chamber are that it keeps the tubes within a reasonable length, protects the flue beads, increases the fire-box heating surface and gives better combustion.

Your committee recommends mud ring with large radius, as shown on any one of the illustrations and the flanges of the tube and door sheet should be carried back far enough to get at least three straight rivets through the ring. Scarf the inside sheets down to be properly fitted to the mud ring by heating the same. If the scarfing and the fitting of these sheets is given proper attention it will overcome leaky mudring corners

that some of the members are now experiencing considerable difficulty with.

THROAT SHEET.—From the replies received, the distance from the top of the grate to the bottom of the lowest

Fig. 9. Type of Mudring Corner.

bolier tube on wide firebox engines is a minimum of 14 ins. and a maximum of 26 ins., average about 22 ins. Narrow fireboxes have a minimum of 13 ins. and a

Fig. 10. Type of Mudring Corner.

maximum of 28 1/2 ins., average about 20 ins. One member who uses hard coal, advises a distance of 8 1/2 ins. minimum and 12 ins. maximum. This height is

Fig. 11. Type of Mudring Corner.

limited due to the design of the locomotive.

Your committee recommends as deep a throat sheet as the design of the locomotive will permit. On consolidation locomotives the depth of the throat sheet is limited, due to the frame passing un-

der firebox and on account of rear driving wheel, which is located under firebox. On Atlantics, Mikados, Mallets and Pacific type a deeper throat sheet can be obtained, as it is not necessary for the frames to pass under the firebox. Your committee also suggests the design of throat sheet as shown on fig. 13, on boilers with sloping mud ring to allow for

Fig. 12. Type of Mudring Corner.

more uniform spacing of stay bolts and location of arch tubes and simplifies the flanging of the throat sheet and flue sheet.

From the replies received in regard to thinning out of flue and door sheets, also the use of countersunk rivets where these sheets are joined to the side sheets, you will find the different methods followed out in fig. 14. About 50 % of the

Fig. 14. Use of Countersunk Rivets at Juncture of Sheets.

members thin out these sheets and apply countersunk rivets. It is generally acknowledged that the thinning of the sheets and the countersinking of rivets is necessary on oil burning locomotives. The general practice seems to be to countersink these rivets about half way up the side sheets. No data were given in regard to which practice is the best from a maintenance standpoint.

Fig. 15. Various Designs of Firedoor Holes.

SPACING OF RIVETS IN FIREBOX Seams.—Your committee suggests 3/4 in. rivets spaced 2 ins. apart, as this is used by the majority of the members who replied to the circular.

DESIGN OF FIRE-DOOR HOLE.—Fig. 15 shows various designs of fire-door holes used by different members. Three members advise that they use style A, which is the O'Connor type of fire door. One of the members reports that they have had 1,200 locomotives equipped

with this type of fire door for a number of years. On boilers so equipped, they have had several cases where the door sheets have remained in perfect condition although two sets of side sheets and a second back-flue sheet had been applied and cracked badly. In every instance the door hole remained in practically perfect condition when the rest of the firebox was cracked to the point of renewal. Boilers equipped with this type of fire-door hole give larger water space, fewer staybolts about the door seam, seems to give freedom for expansion and contraction and also largely prevents mud and scale collecting at this point.

Six members favor style E, and eight members style D.

It seems to the committee that style A, would have a tendency to collect mud

Fig. 13. Throat Sheet for Sloping Mudring.

and burn out. The committee has no choice between styles B, C, D, and E.

NUMBER AND SIZE OF FIRE DOORS.—We find that various sizes and numbers of door holes are used on different types of boilers.

Canadian Freight Association, Western Lines.

At the annual meeting in Winnipeg, Aug. 1, the following officers and committees were elected:—

President, C. E. Dewey, General Freight Agent, G. T. Pacific Ry.; Vice President, W. C. Bowles, General Freight Agent, C.P.R.

Executive Committee.—C. E. Dewey, W. C. Bowles, G. Stephen.

Car Service Committee.—A. Hatton, J. P. Driscoll, T. P. White, W. B. Harris.

Classification Committee.—W. B. Langan, G. Stephen, C. E. Dewey, W. G. Manders, R. J. Foreman, P. H. Burnham, W. C. Bowles.

Inspection Committee.—W. G. Manders, G. H. Smith, W. J. Hunter, P. H. Burnham.

The Present and Future Duties of General Air Brake Inspectors.

By B. J. Langan, General Air Brake Inspector, Delaware, Lackawanna and Western Rd.

The present duties of the general air brake inspector are to be thoroughly familiar with the conditions existing on his road, regarding motive power and equipment, grades, yard facilities, inspection and maintenance, train handling and instructions, and, in fact, on all subjects wherein the air brake is involved. As his duties require him to be on all divisions of the system, he is in a position that by careful observation, he can become invaluable to the road he represents, by suggestions to better the service, as the questions of rough handling and inspection are of vital importance in transportation matters.

Rough handling in yard terminals should attract his attention, especially in flat yards, as this is the originating point of breaking in two, and where damage to lading can be traced. It can be controlled in hump yards by a check system on each car rider who rides the car to its destination in the yard, but in flat yards, where "kicking" or shunting is resorted to, the damage is appalling, when we know it can be reduced. The general air brake inspector cannot get results, unless he rides on freight trains to get conditions as they exist, and see that instructions are being followed. He should be able to handle trains in any class of service and give practical demonstrations when called upon to do so. By this method he is in a position to state what is necessary to control trains in grade work and the air facilities required regarding pump and main reservoir capacity.

Let us first consider his present duties. He should check the brake equipment on locomotives, and reduce the different types to a standard, by having air pumps, engineers' brake valves, feed valves, pump governors and main reservoirs of one type, if possible, and by so doing, will reduce engine failures, carry less stock, reduce cost of repairs, and the locomotive engineers on whom we depend for results will be in a better position to follow instructions than they are where a variety of these parts is in use.

His next consideration should be the brake arrangement on freight cars. This, I consider of the utmost importance, as a great amount of efficiency and money is lost by improper foundation brake arrangement. The application of air brakes to all freight equipment makes it essential that maintenance is the paramount issue to get the full value for which they were applied, and increase the factor of safety. When a locomotive is built, it is given a tonnage rating, and this is not reduced at any time. When this locomotive cannot pull its tonnage, the necessary repairs are made and it represents 100% until sent to the shop for repairs. How near 100% are our freight brakes maintained?

Do we get over our equipment by the cleaning process yearly? How many packing leathers are applied monthly or yearly? What is the angle of brake hangers on our equipment? Is it such that we get uniform wear on the brake shoe? What is the length of brake beam? Do the shoes overlap? On this alone he can save his salary. Have we an easy method of adjustment of piston travel so that inspectors will not neglect this important part of their duties? Have we a card system, and is it being given proper attention? Have we proper air facilities in yards? Are our inspection forces properly organized? This requires personal supervision. Are we supplying the different inspection points with material to maintain your brakes? Do we visit the inspection points on the system to show the men

that we are keeping in touch with the work? Do we call the attention of our superiors to the necessity of needed improvements at the different points, to properly maintain brakes?

Go into these questions thoroughly and it will surprise the most sceptical what an added improvement can be made. You may say our company will not spend the money. That is, because you have not shown that the damage can be reduced a greater amount than the cost of needed material. There are no officials, when shown that a saving can be made by a small expenditure, who will fail to take advantage of it and it is your duty to call their attention more than once to the importance of its necessity.

Give attention to qualification of firemen who are being promoted to engineers. They should have a general knowledge of brake mechanism, and on roads with grades of $1\frac{1}{2}\%$ or greater, should be required to handle trains before final examination. This method has been followed by the writer, going with the men when occasion permits and the results are excellent. A newly promoted engineman without experience should be accompanied by the road foreman of engines or the general air brake inspector on his first trip, if possible. Instructions should be furnished him in pamphlet form for handling trains, or printed in the special rules on the back of time card. It is seldom that an engineer will carry his book of rules with him, but the time card must be always present. This is a great aid, and lessens the difficulty of train handling by old and young enginemen. We may have the brake equipment in perfect condition, but through lack of judgment or knowledge of proper manipulation on the part of the engineman, serious damage occurs, and our best efforts are in vain.

What does inspection mean? It is insurance against damage and a premium on safety. To the general yard master, a bone of contention. To the railway, one of its best assets. The word, as understood by the general air brake inspector, implies that when a train is inspected, defects have been located and repaired. How often, through the neglect of an inspector, do we find the cost of wrecks running into thousands of dollars, by failing to apply a cotter pin or split keys? Brake rigging down, caught switch point or frog, and in many cases this is due to yard masters hurrying the inspector. This condition should not exist. When the train is made up and the inspector puts on his blue flag, the amount of work to be done should govern the time to put the train in a safe condition before dispatching. If too long a time is required and congestion takes place, it shows clearly that not enough inspectors are employed, and it is the duty of the general air brake inspector to remedy it. Safety is the first consideration in all train movements, and can only be obtained by time and men to do the work.

This takes us to an important subject, and one in which the general air brake inspector should be thoroughly familiar, as it involves the questions of breaking in two, which are made prominent on account of detentions to trains of superior class, and damage to lading and equipment. The originating point of these breaks is in yard terminals, and any operating official can be convinced of this by remaining in a yard one day, flat yards, where cars are "kicked," being most conspicuous. When we consider that the draft gear in 90% of the cars in service will only absorb a shock

of 40,000 to 60,000 lbs., and a loaded car kicked or shunted against a number of cars at a speed of 5 m.p.h. will develop 300,000 to 500,000 lbs., is it any wonder that railways are paying large sums each year as indemnity loss on lading, not speaking of the cost of repairs to equipment? So long as the car is not broken, this damage loss cannot be estimated or traced to any particular yard, but the necessity of proper instruction to switchmen by train and yard masters, and to switch engineers by road foremen of engines, would be a remedy properly applied. It is true, in yard movements, that the engineer must follow the signals of switchmen, but moderation on the part of both would give better results.

While I have stated that loaded cars at five miles an hour coming in contact with a train of such cars, will cause shocks of 300,000 to 500,000 lbs., what must it be at 10 or 12 miles an hour? It means that this condition will prevail to a great extent, and the necessity of a friction draft gear that will absorb 250,000 to 300,000 lbs. is the question, and it is the future duty of the general air brake inspector to keep before his superior officers.

The logical method of making up mixed trains has been to keep all loaded cars next to the locomotive, and all empty cars on the rear, but so much trouble has been experienced in keeping trains of this kind intact when brake applications were made, that tests have proven they can be handled successfully by deviating from this practice. Loads should not be placed indiscriminately throughout a train. I have in mind three cases of recent date, in one of which the consist was 55 empty cars, 17 loads, 15 empties. A hose burst on the head portion of the train, and the shock from the loads running in caused the train to buckle, throwing the empty cars immediately in front of the loads, on the opposite track. Another case of a train parting with loads in three separate places, and seven loads on the rear of a 75 car train caused a similar accident.

Tests which the writer conducted with a dynamometer car, show the necessity of changing the old method and prove, after a year's trial, that the make-up of mixed trains should be as follows: Ten empty cars next to the engine. All loads immediately behind the 10 empty cars, and the remaining empty cars on the rear. The number of empty cars on rear should be in excess of those on the head end. Regardless of the number of cars in such trains, the empty cars on front portion should not exceed 10, and this to avoid such accidents as quoted, to prevent buckling. On one division of the D.L. and W.R., where this practice has been followed, there is no complaint of breaking in two, and conductors and engineers will tell you it is the only way to handle them successfully.

Breaking in two occurs on trains of all loads and all empties, but when a condition exists where engineers are afraid to use the automatic brake, it should be remedied at once. Superintendents and yard masters may object on the ground that it requires too much switching—it requires not more than two switch movements, and a trial will convince that it is worth the effort. There is nothing in railway work that cannot be done when a question of safety is involved—the saving of equipment and probably loss of life must be considered.

With a train of 25 loads and 50 empty cars, there is eight times greater retarding force on the empties than on the loads. By transferring 10 empty cars next to the locomotive, this ratio is changed less than $2\frac{1}{2}\%$, as you have taken 20% from behind the loads and added it to that of the loads. In case of train parting by accident or other-

wlse, the empties on rear will prevent the loads running in, and an emergency application can be made without bad results.

With a train of the first consist, 25 loads, 50 empties, running at 15 to 20 miles an hour, make a 12 lb. reduction, and when speed has been reduced to six or eight miles an hour, a jerk of 150,000 to 170,000 lbs. is registered and the train parts, as the knuckles will not stand more than 150,000 lbs. How much more this jerk would be, I am unable to state, as in all cases the train parted when this amount registered. As the draft gear would only absorb 40,000 to 60,000 lbs., you can realize that in a short time it has a telling effect on the equipment.

With a train of the second consist, 10 empties, 25 loads, 40 empties, the greatest shock did not exceed 40,000 lbs., first getting a buffing strain of 15,000 to 20,000 lbs., and as the slack adjusted itself in the train, no bad effects were felt, it being a gradual strain.

The breaking in two from other causes should be recorded by each division superintendent, showing name of engineer and cause, a monthly report of same to be made to the general air brake inspector, so that a remedy can be applied.

The general air brake inspector on any road cannot be of great value unless he has the co-operation of the transportation officials, and he is of great service to them in solving methods of dispatching trains with safety, lessening the account of damage and loss, and increasing regularity of train service. These are his future duties. He should not be confined to too much office work—his duties require him on the road, checking the work of inspectors in yards, to see that proper methods are used to facilitate in dispatching trains, and that the work is properly done.

I have not touched on the subject of passenger brakes, as I feel that the importance of this question is given such attention by all railway officials, and the freight brakes neglected, and that the question of future duties is in re-deeming the freight brakes and getting as near 100% efficiency as possible.

1. With dynamometer car alone dropped at a speed of seven miles an hour over the hump and allowed to run into a cut of loaded steel hoppers, standing still, we got a huffing shock of considerably over 607,000 lbs. This being the limit of the dynamometer, we were unable to give the total amount of the blow. The dynamometer car weighs 51,000 lbs.

2. Two cars, the dynamometer car first, and a loaded class G1 car behind, were dropped over the hump at a speed of two miles an hour, into the cars, and showed a buffing shock of 207,000 lbs. This class G1 car weighed 130,000 lbs., making a total of 181,400 lbs. for the two cars.

3. With the same two cars as per the second test, with tests made in the same manner, but at a speed of 3-9-10 miles per hour, the buffing shock was 420,000 lbs.

4. We placed a loaded class G1 car, weighing 141,400 lbs., part way down the hump, or at the point at which usually stopped by car droppers until other cars are weighed and dropped against it when going to the same classification track. Then same two cars as used in tests 2 and 3, or dynamometer car and a class G1 car next, with total weight of 181,400 lbs., were dropped at a speed of four miles an hour against the car standing on the hump the same as in actual practice, and the buffing shock was 445,000 lbs.

For the purpose of determining the magnitude of the blow when one car runs into another, we made four tests in one of our hump yards.

Orders by Board of Railway Commissioners.

Beginning with June, 1904, we have published in each issue summaries of orders passed by the Board of Railway Commissioners, so that subscribers who have filed our paper have a continuous record of the Board's proceedings. No other paper has done this.

The dates given of orders, immediately following the numbers, are those on which the hearings took place, and not those on which the orders were issued. In many cases orders are not issued for a considerable time after the dates assigned to them.

16966. July 9.—Dismissing city of Ottawa's application re express delivery limits.

16967. July 6.—Authorizing G.T.R. to build siding for Carroll Bros., Humberstone tp., Ont.

16968, 16969. July 10, 11.—Authorizing G.T.R. to use interlocking plant at drawbridges built over St. Lawrence river and Soulages canal; and to raise bridge 7 across Grand River on its Holmedale branch by one foot.

16970. July 6.—Authorizing G.T. Pacific Ry. to cross highway at mileage 28.3 North Alberta District.

16971. July 6.—Approving C.N. Ontario Ry. station grounds at Kilfoyle, Montague tp., Ont.

16972, 16973. June 28, July 9.—Authorizing C.N. Ontario Ry. to cross public road between cons. 2 and 3, Whitby East tp., Ont.; and to cross Montreal Park and Island Ry. at Sault au Recollet, Que., room to be left for second track.

16974, 16975. July 10.—Authorizing C.N. Quebec Ry. to extend siding on Prince Albert Ave., Tetreaultville, Montreal, crossing Laurier and Azilo Sts., and to build spur for American Canning Co., Maisonneuve.

16976 to 16978. July 11, 6, 11.—Approving location of Campbellford, Lake Ontario and Western Ry. (C.P.R.), mileage 177.3 to 183.51, from King St. West, Port Hope, to mileage 127.32; and authorizing it to build across Oshawa Electric Ry. at mileage 158.85, interlocking plant to be installed.

16979. July 6.—Authorizing C.P.R. to build its Harrowby ballast pit spur across four highways in Manitoba.

16980. July 8.—Rescinding order 16517, May 11, re C.P.R. spur at Blind River, Ont.

16981, 16982. July 9, 4.—Authorizing C.P.R. to build spur for Crushed Stone and Gravel Ltd., on s.e. ¼ sec. 34, tp. 35, r. 14, w. 3 m., and to build transfer track to connect with Midland Ry. of Manitoba, in lots 44 and 45 outer 2 miles, St. James parish, Winnipeg.

16983 to 16985. July 10, 9.—Authorizing C.P.R. to build bridge 103.3, Sudbury subdivision and rebuild bridge 91.5, Toronto subdivision, and approving plans for bridge 112.2, Cascade subdivision, B.C.

16986. July 8.—Authorizing C.P.R. to revise main line in Woodstock, Ont., subway to be built at Dundas St., 20% of cost to be paid from railway grade crossing fund.

16987. July 12.—Ordering G.T. Pacific Ry. to build station on lot 882, group 1, Casslar District, B.C., with leave to apply for approval of station site that will give adequate facilities to Hazelton, and rescinding order 16891, June 25, in same connection.

16988. July 2.—Ordering G.T.R. to install two electric bells at Elgin and Elizabeth Sts., St. Marys, Ont., 20% to be paid from railway grade crossing fund.

16989. July 13.—Amending order 16912, June 28, re taking of G.T.R. lands by Campbellford, Lake Ontario and Western Ry. (C.P.R.) by providing that if parties do not agree as to compensation for land taken within 30 days, same shall be fixed by one of the Board's engineers.

16990. July 8.—Authorizing C.P.R. to build subway at Syndicate Ave., Fort William, Ont.

16991, 16992. July 13.—Authorizing C.P.R. to build additional track across Rogers St., Victoria Drive and Salisbury Drive, Vancouver, B.C.

16993. July 13.—Dismissing C.P.R. application re rehearing of station case at St. Francois de Sales, Que.

16994. July 13.—Authorizing C.P.R. to build main line and additional track across Wall St., Hastings, Vancouver, B.C.

16995. July 13.—Dismissing application of F. Gravel, Chateau Richer, Que., with leave to renew, re farm crossing on Quebec Ry., Light Heat and Power Co.'s line.

16996. July 12.—Approving plan of G.T.R. cross-over switch east end of Cardinal yard, Ont.

16997. July 11.—Authorizing G.T. Pacific Branch Lines Co., to build industrial spur in Yorkton, Sask.

16998 to 17001. July 8 to 15.—Authorizing C.P.R. to build spurs near Longue Pointe, Que., and certifying correction; for Saskatoon Public School District Board, Saskatoon, Sask.; Ogilvie Flour Mills Co., Fort

William, Ont., and McGregor and McIntyre, lot 28, con. 2, from bay, York tp., Ont.

17002. July 8.—Authorizing Campbellford, Lake Ontario and Western Ry. (C.P.R.), to connect at mileage 183.51 from Glen Tay with Ontario and Quebec Ry. (C.P.R.), at mileage 87.41 west from Havelock, Ont.

17003. July 13.—Authorizing G. Mailoux to build farm crossing across G.T.R. near milepost 23½ from Windsor, Ont.

17004. July 13.—Ordering G.T.R. to install gates within 60 days at crossing of Main street, Victoriaville, Que.

17005. July 13.—Approving change in C.P.R. station building at St. Augustin, Que.

17006. July 8.—Authorizing C.N. Ontario Ry. to build across public road in Ste. Genevieve parish, Que.

17007. July 13.—Authorizing Empire Limestone Co., to build tunnel under Carroll Bros.' siding in lot 5, con. 1, Humberstone tp., Ont.

17008 to 17011. July 8.—Approving C.N. Ontario Ry. revised location through Boulter, Lauder, Pentland, Master, Stratton and Barron tps., Nipissing District; authorizing it to cross public road between lots 5 and 6, Ross tp., and approving revised location in Beauce tp., Nipissing District, Ont.

17012. July 13.—Authorizing Campbellford, Lake Ontario and Western Ry. (C.P.R.), to change its line and cross Bay of Quinte Ry. at mileage 43.86, in Camden tp., Ont.

17013. July 15.—Approving changes in location of C.P.R. station at North Wakefield, Que.

17014 to 17016. July 16.—Authorizing C. N. Ontario Ry. to cross public roads in Bristol tp., Que., and Westmeath and Torbolton tps., Ont.

17017. July 16.—Authorizing G.T.R. to build spur for J. Duff and Son, Hamilton, Ont.

17018 to 17020. July 16.—Approving revised location of G.T. Pacific Branch Lines Co., Cutknife branch, mileage 26.26 to 38.74, Sask., and authorizing it to build spur for McLeod Collieries, Ltd., from its Alberta Coal Branch, and to build spur for Jasper Park Collieries, North Alberta District.

17021. July 16.—Approving Montreal and Southern Counties Ry. location from Ranelagh to boundary between Longueuil and Laprairie parishes, Que., 4,500 ft.

17022. July 13.—Ordering C.P.R. within 90 days to install electric bell at Queen St., Woodstock, N.B., 20% to be paid from railway grade crossing fund.

17023. July 16.—Ordering Temiscouata Ry. within 30 days to remove cattle guard and earth at crossing of Grand Falls road, under penalty of \$25 a day.

17024, 17025. July 15.—Approving revised location Campbellford, Lake Ontario and Western Ry., mileage 155.13 to 157, from Glen Tay, approving location through Whitby, Ont. and authorizing crossing of main line two additional tracks in con. 1, East Whitby tp., Ont.

17026 to 17028. July 16.—Authorizing C.P.R. to build spurs for Fitzsimmons Fruit Co., Port Arthur, Ont., Crows Nest Pass Lumber Co., Calgary, Alta., and Rocky Mountain Cement Co., Blairmore, Alta.

17029, 17030. July 15, 16.—Approving C.P.R. plans for span at eastbound hump in new yard, East Winnipeg, Man., and bridge 131.3 Brandon subdivision.

17031. July 18.—Authorizing G.T.R. and C.P.R. to operate over interlocker west of Fergus, Ont., without stoppage.

17032. July 15.—Authorizing G.T.R. to build three bridges carrying highways, Louth tp., Ont.

17033, 17034. July 18.—Ordering that work be commenced forthwith on separation of grades, Toronto, and completed by Sept. 1, 1914, under penalty of \$100 a day, and approving G.T.R. plan for new union station, Toronto, same to be commenced forthwith and completed not later than Sept. 1, 1914, under penalty of \$100 a day. These orders were given in full in Canadian Railway and Marine World, Aug., pg. 401.

17035. July 17.—Authorizing G.T. Pacific Branch Lines Co. to build its Prince Albert Branch across highway at mileage 101.5.

17036. July 11.—Reserving for further consideration, approval of location of Campbellford, Lake Ontario and Western Ry. (C.P.R.), mileage 121 to 124.83 and authorizing it to take lands of G.T.R. and C.N.O.R.

17037 to 17041. July 16.—Approving C. N. Ontario Ry. revised location through Westmeath, tp., through unsurveyed territory in Algoma and Sudbury Districts, and authorizing it to build across Wanapitit river, Street tp.

17042. July 16.—Authorizing Canadian Northern Ry. to cross 14 highways with its Alaska southeasterly line.

17043. July 15.—Authorizing C.N. Ontario Ry. to connect with Malleable Castings Co.'s siding in Smiths Falls, Ont., and to cross four streets.

17044. July 16.—Authorizing C.N. Quebec Ry. to cross seven highways in Two Mountains and Terrebonne counties.

17045. July 17.—Authorizing C.N. Ontario Ry. to construct across Nichols Creek, Marlborough tp., Ont.

17046 to 17048. July 17.—Approving Canadian Northern Ry. revised location, mileage 206.95 in Saskatchewan to 230.62 in Alberta.

17049. July 17.—Authorizing C.N. Ontario Ry. to build across two highways in Bristol tp., Que.

17050. July 17.—Authorizing Canadian Northern Ry. to build its Alsask Southeastern line across 10 highways.

17051. July 17.—Approving revised location of Algoma Central and Hudson Bay Ry. between mileage 82.38 and 123.53 northerly from Hobon, Ont.

17052. July 17.—Relieving Vancouver, Victoria and Eastern Ry. (G.N.R.) from erecting and maintaining fences on portion of its line between Keremeos and Princeton, B.C.

17053. July 17.—Authorizing Campbellford, Lake Ontario and Western Ry. (C.P.R.), to cross highways from mileage 128.09 to 131.23 Hope, tp., Ont.

17054. July 17.—Authorizing Atlantic, Quebec and Western Ry. to open for traffic its line between Grand River station, mileage 51½ and Gaspe station, mileage 102½, Que.

17055. July 17.—Naming express delivery and collection limits for Estevan, Sask.

17056. July 16.—Authorizing C.P.R. to build spur for Saskatoon Tent and Mattress Co., Saskatoon, Sask.

17057. July 17.—Authorizing Canadian Northern Ry. to cross nine highways on its Alsask Southeastern line.

17058. July 17.—Authorizing James Bay and Eastern Ry. (C.N.R.) to build bridge across Salmon River, mileage 22.1.

17059. July 17.—Authorizing Vancouver-Victoria and Eastern Ry. (G.N.R.), to open for traffic its line from Abbotsford to Kilgord, B.C.

17060. July 17.—Authorizing C.P.R. to build spur for Winnipeg Supply Co., Winnipeg.

17061. July 19.—Authorizing C.P.R. to revise grade of main line and build additional main line track from mileage 17.35, Farnham subdivision to Itherville Jct., thence to mileage 41.8 Highlands, Que.

17062. July 18.—Authorizing C.P.R. to build spur for Roofer's Supply Co., Toronto.

17063. July 18.—Authorizing C.N. Quebec Ry. to cross public road in St. Eustache parish.

17064. July 5. Re interswitching by G.T.R. in Galt, Preston, Hespeler, Berlin and Waterloo, Ont. This order is given in full on another page.

17065. July 15.—Authorizing C.N. Ontario Ry. to cross Jacques Cartier and Union Ry. (G.T.R.), near Jacques Cartier Jct., Que., interlocker to be installed.

17066. July 20.—Apportioning cost of work, etc., re C.N.R. and G.T.P.R. spur for Tuxedo Park Co., Winnipeg, Man.

17067. July 17.—Authorizing Canadian Northern Ry. to cross public road on its Alsask Southeastern line.

17068. July 19.—Authorizing G.T.R. to build certain bridges on its Holmedale branch, Brantford, Ont.

17069. July 19.—Ordering G.T.R. to file within 15 days, plan of location of station proposed at level crossing of Quebec, Montreal, and Southern Ry., at St. Gregoire; that St. Gregoire be established as regulation station with telegraph communication between Doucets Landing and Victoriaville; and that Q.M. and S.R. build platform for transfer of passengers.

17070, 17071. July 15.—Approving proposed change of C.P.R. station at Bredenbury, Sask., and change in location of C.P.R. station at Merritt, B.C.

17072. July 20.—Ordering C.P.R. to maintain permanent watchman, day and night, at crossing at mileage 101.6 Boundary subdivision, near Fisherman, B.C.

17073. July 19.—Authorizing Toronto Eastern Ry. to cross public road on con. 2, between Pickering and Whitby tps.

17074. July 19.—Authorizing Campbellford, Lake Ontario and Western Ry. (C.P.R.), to build bridges 180.2 and 180.13, at Little Rouge and Big Rouge Rivers, Ont.

17075. July 19.—Authorizing C.P.R. to build spur for Provincial Reformatory, lot 3, con. 1, Guelph tp., Ont.

17076, 17077. July 19.—Approving C.P.R. proposed shortening of track circuit in connection with crossing bells at Argyle St., Renfrew, Ont., and interlocking and signal device to be used in operating over the Lachine canal.

17078. July 19.—Authorizing C.N. Ontario Ry. to cross public road between cons. 16 and 17, Ferris tp.

17079. July 19.—Approving C.N. Ontario Ry. station grounds at Smiths Falls, subject to agreement of June 3, 1911, with the town.

17080. July 20.—Authorizing C.N. Ontario Ry. to cross G.T.R. near Davenport Road,

Toronto, question of taking of lands left to Chief Engineer of Board.

17081. July 20.—Ordering G.T. Pacific Ry. to repair approaches to crossing on D. McKenzie's property, Kirk, Alta., within 30 days under penalty of \$25 a day.

17082. July 20.—Authorizing Lachine, Jacques Cartier and Maisonneuve Ry. (G.T.R.), to take lands 597 ft. by 100 ft. wide, of Montreal Park and Island Ry. in St. Laurent parish, Montreal.

17083, 17084. July 22.—Approving C.P.R. plans for steel trestle of bridge 26.8, Suffield-Kipp subdivision, and authorizing it to rebuild bridge 109.4, Muskoka subdivision.

17085. July 22.—Authorizing G.T.R. to build spur for New Burford Canning Co. Brant county, Ont.

17086. July 22.—Approving G.T. Pacific Branch Lines Co.'s proposed station and site at Edwin, Sask.

17087. July 20.—Ordering Dominion Atlantic Ry. to install gates at Gerrish St., Windsor, N.S., 20% to be paid from railway grade crossing fund.

17088. July 23.—Dismissing application of Board of Trade, Pelly, Sask., re delay to shipments of freight by Canadian Northern Ry.

17089. July 22.—Ordering C.N.R. within 10 days to file plan for station at Fort Frances, Ont.

17090. July 22.—Authorizing Toronto Suburban Ry. to cross under C.P.R. in Vaughan tp., Ont.

17091. July 22.—Authorizing C.N. Ontario Ry. to build across Wistiwasung river, Chisholm tp.

17092. July 22.—Authorizing Campbellford, Lake Ontario and Western Ry. (C.P.R.), to cross G.T.R. at mileage 163.46 from Glen Tay, interlocker to be installed.

17093. July 22.—Authorizing Campbellford, Lake Ontario and Western Ry. (C.P.R.), to build bridge 170.57 over Duffins Creek, Ont.

17094. July 22.—Approving location of Georgian Bay and Seaboard Ry. (C.P.R.), station on lot 18, con. 9, Cartwright tp., Ont.

17095. July 23.—Approving Campbellford, Lake Ontario and Western Ry. (C.P.R.), revised location from mileage 63.59 to 68.50 and from mileage 70.25 to 72.44.

17096. July 23.—Authorizing C.P.R. to build bridge over Wyandotte St., Windsor, Ont.

17097. July 22.—Authorizing C.P.R. to build spur for Twohy Bros., on its Thompson subdivision, near Kamloops, B.C.

17098. July 23.—Authorizing C.P.R. to build spur across Avenue E. for Western Foundry and Machine Co., on lots 9 and 31, and lane between, Saskatoon, Sask., and rescinding order 16581, May 23 in same connection.

17099. July 22.—Authorizing Campbellford, Lake Ontario and Western Ry. (C.P.R.), to build across highways from mileage 141.26 to 154.3, Durham county, Ont.

17100. July 23.—Authorizing Canadian Northern Ry. to build across certain highways on its Strathcona-Calgary extension, Alta.

17101. July 23.—Approving of the location of the Canadian Northern Montreal Tunnel and Terminal Co. station and track layout, Montreal.

17102. July 23.—Authorizing Central Ry. of Canada to build across certain highways near McAlpine, Ont.

17103. July 23.—Approving Kettle Valley Ry. location, between mileage 40 and 57.4, west of Hydraulic Summit, B.C.

17104. July 23.—Authorizing C.P.R. to open for traffic portion of its second track, mileage 114.54 to 119.06, Kenora subdivision.

17105. July 22.—Approving location of Campbellford, Lake Ontario and Western Ry. (C.P.R.), from mileage 160.86 to 161; 165 to 174, and 176 to 177.30, all from Glen Tay, Ont.

17106. July 22.—Authorizing C.P.R. to build additional track across public road at lot 30, con. 7, Spencerville, Ont.

17107. July 22.—Authorizing Michigan Central Rd. to build spur for Shredded Wheat Co., Niagara Falls, Ont.

17108. July 25.—Approving location of Erie, London and Tillsonburg Ry., from mileage 1, near Port Burwell, mileage 13.6 at Aylmer, Ont.

17109. July 24.—Authorizing C.P.R. to rebuild bridge 100.6, Sherbrooke subdivision, Que.

17110. July 25.—Authorizing C.P.R. to build two private crossings opposite Granville St., and opposite Burrard St., Vancouver, B.C.

17111. July 24.—Authorizing C.P.R. to build two additional sidings on lots 10 and 11, con. 1; and across Glasgow St., London, tp.

17112. July 24.—Authorizing G.T.R. to rebuild bridges 203 at mileage 151.05 20th district, Northern Division, and 49, at mileage 95.80, 15th District, Middle Division.

17113. July 23.—Authorizing Canadian Northern Montreal Tunnel and Terminal Co. to cross C.P.R. by carrying same overhead, Montreal, and to cross C.P.R. near Outremont Yard, Montreal.

17114 to 17116. July 23, 25.—Authorizing C.P.R. to build spurs for McGillivray Coal and Coke Co., Coleman, Alta.; Buell & Co., Cochrane, Alta., and two spurs for Alberta Ice Co., Keith, Alta.

17117. July 23.—Authorizing C.P.R. to cross public road between sec. 31-51-24 and sec. 6-52-24, w. 4 m., on its Strathcona-Calgary extension, Alta.

17118. July 24.—Authorizing C.N. Ontario Ry. to cross public road between lots 30 and 31, con. 1, Nepean tp.

17119. July 22.—Ordering that stop over privileges granted to British Canadian Cannery, Ltd., by railways operating from the Peninsula westward, in Ontario, be granted them at two points east of Toronto, viz., Bowmanville and Cobourg.

17120. July 19.—Approving and authorizing G.T. Pacific Branch Lines Co. station grounds on Tofield-Calgary branch between tps. 42.21 and 41-21, w. 4 m.

17121. July 27.—Authorizing C.N. Ontario Ry. to cross public road between lots 84 and 85, Ste. Dorothee parish, Que.

17122. July 29.—Dismissing application of C.P.R. for authority to build its Asquith to Conquest branch, across G.T. Pacific Ry. in sec. 20-26-6, w. 3 m., Sask.

17123. July 30.—Dismissing application of town of Forward, Sask., to order C.P.R. to furnish station, telegraph service, etc.

17124. July 24.—Approving G.T. Pacific Branch Lines Co., station and site at Dinant, Alta.

17125. July 29.—Dismissing application of C. M. Kelly, Edmonton, Alta., in relation to the diversion of Fort Saskatchewan Trail, and crossing of G.T. Pacific Ry. over same.

17126. July 29.—Dismissing G.T. Pacific Ry. application for leave to appeal to the Supreme Court from order 16700, authorizing crossing of the G.T.P. Ry. at Spruce St., Edmonton, Alta.

17127. July 29.—Dismissing petition of residents of Resplendent, B.C., alleging that supplies carried on G.T. Pacific Ry. in that district for contractors' use have been sold in competition to private dealers.

17128. July 29.—Authorizing C.P.R. to remove spur connecting lot 23, part of block 1, lot 1, St. John parish, Winnipeg.

17129. July 29.—Ordering Canadian Northern Ry., on or before Sept. 1, to build farm crossing on A. Meunier's farm on s.e. ¼ sec. 16-24 w. 4 m., Alta.

17130. July 29.—Ordering G. T. Pacific Ry. on or before Sept. 1, to survey and convey to city of Edmonton, Alta., a lane 20 ft. wide in lieu of lane blocked by company's construction.

17131. July 29.—Ordering Canadian Northern Ry. to fence portion of its right of way from Saskatoon to northern limits of rural municipality 344, to be completed on or before Nov. 1.

17132. July 29.—Ordering Hamilton Radial Ry. to make gravel crossings at suitable point for accommodation of each house on its track south of canal, Burlington Beach, Ont., wherever such a crossing does not already exist, within 30 days.

17133 to 17136. July 30.—Approving agreements between Bell Telephone Co., and East Middlesex Telephone Co., Byron Telephone Co., North Colchester tp., and Brook tp., Ont. for interchange of service.

17137. July 31.—Approving of location of Edmonton, Dunvegan and British Columbia Ry., mileage 29.783 to 68.30 and authorizing it to cross highways.

17138. July 31.—Approving agreement between Bell Telephone Co., and Rochester tp., Ont., for interchange of service.

17139. July 26.—Approving proposed change in location of C.P.R. station building at St. Hermanas, Que.

17140. July 30.—Authorizing Canadian Northern Montreal Tunnel and Terminal Co. to cross Cote de Liesse Road, St. Laurent parish, Que.

17141. July 26.—Approving G.T. Pacific Ry. revision of grade at Tete Jaune Cache, between mileage 179 and 180, Wolf Creek, west, B.C.

17142. July 26.—Authorizing G.T.R. to build spur for A. Knibb and Son, on lot 3, con. 3, Machar tp., Ont.

17143. July 25.—Authorizing G.T. Pacific Branch Lines Co., to operate trains over crossing of its Melville-Regina branch with Canadian Northern Ry. Prince Albert branch, at Regina, without stopping.

17144. July 25.—Authorizing G.T. Pacific Branch Lines Co., to cross and divert highways at mileage 108.9 and 109.2 in sec. 24-48-26, w. 2 m., Sask.

17145 to 17147. July 31.—Approving agreements between Bell Telephone Co., and Osprey, tps.; and West Tilbury tp., Ont., and Nelson Telephone Co., for interchange of service.

17148. July 26.—Authorizing C. N. Ontario Ry. to cross township road at station 3167.84, and to divert highway between mileage 268.63 and 269.23, Crerar tp.

17149. July 25.—Authorizing Edmonton, Dunvegan and British Columbia Ry. to cross

Canadian Northern Ry. at grade in sec. 35-55-25, w. 4 m., just south of Morinville, Alta. Interlocking plant to be installed.

17150. Aug. 1.—Authorizing C.N. Ontario Ry. to cross Levease river and C.P.R. at mileage 224.2 from Ottawa.

17151. July 31.—Authorizing C.N. Ontario Ry. to build spur for Central Ry. of Canada, at McAlpine station, Ont.

17152. July 31.—Authorizing C.P.R. to build bridge over Thames river at Ingersoll, Ont., to carry siding for Stone Fertilizer Co.

17153. July 31.—Authorizing Canadian Northern Ry. to build spur through block 3, Hudson's Bay Reserve, Edmonton, to serve lots 164-168 and 209-211, and to cross Athabasca Ave.

17154. July 31.—Authorizing C.N. Ontario Ry. to cross public road between lots 6 and 7, con. 1, Gibbons tp.,

Grand Trunk Railway Betterments, Construction, Etc.

Central Vermont Ry.—The Public Service Commission of Vermont has approved of the company's plans for a new union station with the Rutland Rd., at Burlington, Vt., and other improvements, in preference to those submitted by the latter company. The C.V.R. plans provide for the separation of grades and for track elevation.

Quebec Freight Sheds, Etc.—Application was made to the Quebec Harbor Commission, Aug. 8, by the company for space to enable it to build new freight sheds in place of the present premises by the riverside. The Commissioners are negotiating with the city council with a view of acquiring certain areas, so as to be able to grant the company all the land between St. Andrew and St. James St., south of Prince of Wales St.

St. Lambert Yards, Etc.—Montreal press reports, Aug. 14, state that preparations are being made for the immediate erection of a 40 stall locomotive house on the south shore, about 1.5 miles from St. Lambert station.

We are officially advised that a contract has been let to the John S. Metcalf Co., Montreal, for the erection of a 27-stall locomotive house, together with turntable pit, machine shop, water supply system and accessories. The locomotive house will be of concrete and brick construction with wooden posts and roof.

Prescott, Ont.—An agreement has been signed under which the G.T.R. will within two years lay out large yards and build thereon a locomotive house and other terminal facilities, at a cost of \$150,000, in consideration of a fixed assessment of \$16,000 a year, and the building of a subway by the town. The laying out of these terminal buildings will necessitate the closing of those at Brockville, and it was stated in Montreal, Aug. 7, that the object in view is the equalizing of the divisions. The distance from Montreal to Brockville is 125 miles, and from Brockville to Belleville 95 miles, while Prescott is almost equidistant from Montreal and Belleville.

We are officially advised that the work to be done at Prescott will consist of the laying out of a terminal yard, with roundhouse, and the other necessary buildings and facilities.

South Parkdale Station.—The Toronto city council is selling 13,344 sq. ft. of land at Sunnyside for the erection of a station to take the place of the old one known as North Parkdale. H. R. Safford, Chief Engineer, is reported as stating that the plans for the new station have been approved, that work on it will be started at once, and that it will be completed this year.

Port Burwell to London.—There is every indication that the charter of the Erie, London and Tillsonburg Ry. has been acquired from J. H. Teall by the G.T.R. The notices calling a meeting of shareholders for Sept. 9, at Tillsonburg, Ont., is signed "Frank Scott" instead of "J. H. Teall" as formerly. Mr. Scott is Treasurer of the G.T.R.

Approval of the plans for the line from

Port Burwell to Aylmer is being asked. Construction is to be gone on with this year, according to a statement made by Mayor Graham, of London, Ont., who added that the G.T.R. is desirous of obtaining a lease of the London and Port Stanley Ry. E. J. Chamberlin, President G.T.R., while in London, Aug. 8, advised the mayor to abandon the idea of electrifying that line, and to lease it to a steam road. It is reported locally that if an agreement to lease the line to the G.T.R. can be arrived at, the line from Port Burwell will be extended from Aylmer to St. Thomas and connected there with the L. and P. S. Ry. (Aug., pg. 415. See Erie, London and Tillsonburg Ry.)

The Fraser River Bridge.

The British Columbia Government's bridge over the Fraser River at New Westminster, an illustration of which is given on this page, and which cost about \$1,000,000, is a very interesting structure. It is 11,985 ft. long including approaches, and is double decked, the lower road being utilized for railways, and the upper for pedestrian and vehicular traffic. It is built on 17 piers, 11 pedestals and 3 abutments, with a centre span opening for the passage of vessels; the pivot pier of the swing span is carried 90 ft. into the river bed; the deepest pier is 141 ft. below high water mark—made up of 69 ft. below the bed of the Fraser and a volume of water 72 ft. in depth. The power for opening the swing bridge is supplied by the B.C. Electric Ry. Co. The lower part of the bridge is being used by the Great Northern Ry. and by the B.C.

The British Columbia Government Bridge over the Fraser River.

Electric Ry. Co. on an annual rental basis. The transmission lines for supplying power for the operation of the B.C. Electric Ry.'s Fraser Valley branch are carried over the bridge on towers at a height of 165 ft. above high water.

The Consolidated Engineering Co., Ltd., has been incorporated under the Dominion Companies Act, with \$100,000 capital, and office at Montreal, to carry on a general railway and other construction business. The incorporators are: S. G. Dixon, J. M. Montle, R. E. Allan, V. and C. T. Jette, Montreal.

Notes on Locomotive Building.

By H. H. Vaughan, Assistant to the Vice President, Canadian Pacific Ry.

While, no doubt, men engaged in operating railway shops are entirely competent to construct new locomotives, there is no question that to do so economically would necessitate a more extensive and systematic supervision than is necessary for straight repair work. No doubt the system thus involved would be a good thing for the shop, but at the same time it is not economical unless the work is sufficient to justify its being occupied.

The tools used in locomotive building can, no doubt, be advantageously employed in repair work, except in the case of special tools which cannot be sufficiently employed in repair work to justify their installation, but could be used to a sufficient extent in building locomotives to expect them to assist in reducing the cost of the locomotive repair output. All the machine tools employed in locomotive building are in addition to those used for turning out a given number of repairs and must be regarded as an additional investment.

The size of shop necessary to accommodate these tools, blacksmith shop, foundry, and other equipment required to construct new locomotives is all, practically speaking, in addition to that required for a repair output. It is therefore entirely unreasonable for a road to consider that because it can turn out locomotives at a cost less than it can obtain them from the builders that it can neglect the additional investment. There are many cases where locomotives have

been turned out without adding anything like a sufficient amount to the actual cost of material and applied labor to cover the necessary expenses in connection with the operation of the plant, to say nothing of the interest and depreciation on the investment involved. Such items as repairs to tools and machinery, maintenance of buildings, supervision, drawing office expenses and a number of charges which have to be taken care of by every concern, are ignored in the case of railways building their own locomotives.

I do not believe there is a railway shop

in the country which constructs a new locomotive with as low a net cost of labor as any of the large building concerns do. It is true that even if expenses are evenly pro-rated, they may show a saving which is part of the profit obtained by the locomotive builder. This profit is, however, expended by the builder in keeping his plant up to date or spending dividends on the moneys invested in his plants so that when all is said and done the saving on the part of the railway company is comparatively small if looked at from a broad point of view.

I do not see why standards cannot be just as well obtained when locomotives are purchased as when they are constructed by a road itself. The question of design is not affected by purchasing or building, but when locomotives are arranged for without regard to maintaining a standard class of power, it is therefore no wonder that some roads get so many diversities of equipment. The standardization obtained in England is not so much on account of a road building its own locomotives, but on account of the large amount of responsibility placed on the locomotive department in the designing of its power and the permanence of the locomotive policy on the roads, not disturbed with each new general manager, but allowed to take its course and progress in a systematic way. There are some American roads which have followed similar methods and they have obtained standardization.—Railway Master Mechanic.

Operation of the N.T.R. Superior Junction-Winnipeg Section.

The question of the taking over of the Superior Jct.-Winnipeg section of the National Transcontinental Ry. has been under discussion for some time. At present the line is being operated by the Grand Trunk Pacific Ry. under a special agreement with the Dominion Government, which the company wants renewed. An order-in-council was signed July 27 in which it is recited that the portion of the railway comprising the section for which J. D. McArthur had the contract, and 11 miles of the O'Brien McDougall contract, and extending from Transcona to Superior Jct., "being now completed to the satisfaction of the Commissioners, the Minister recommends that in the event of the G. T. Pacific Ry. not exercising within 30 days from Aug. 12, 1912, its right to take a lease of said portion of the railway under the provision of clause 3 of the statutory agreement of Feb. 18, 1904, the Commissioners be authorized to make such arrangements as they may think best for the further operation of the said portion."

An official statement was made Aug. 7, by E. J. Chamberlin, president G. T. P. Ry., in which he said: "The G.T.P. Ry. has been operating that piece of line since Aug. 1, 1911, handling all of last season's grain business and other traffic offered over that line without any detriment to the public. The Government is now asking that the G.T.P. Ry. execute a permanent lease of that portion of the line between Winnipeg and Lake Superior Jct., known as district F and negotiations are pending between the government and the company on that point, but do not, so far as a matter of accommodation, in any way affect the public. The contract between the government and the G.T.P. Ry. relative to the National Transcontinental Ry., that section between Moncton and Winnipeg, which was to be constructed by the government and is known as the eastern division, provides that:—

"Pending the completion of the eastern division by the Government the company shall be entitled to lease from the Commissioners to be appointed under the said act, and to operate such portions of

the eastern division as may from time to time be completed, upon such terms, etc., but does not bind the railway company to take over any sections unless they desire to do so, until the entire line is completed.

"Negotiations are in progress between the Government and the company relative to a further lease of the section above referred to when it is fully completed and pending the completion of the whole line. Notwithstanding reports in the papers throughout the country, that portion of the Transcontinental line is not yet completed. There is considerable work to be performed on the entrance into Winnipeg, connecting up the Transcontinental with the G.T.P. Ry. and the Canadian Northern at the union station. There is also considerable other work on the line necessary to be done before the terms of the contract are complied with.

"With regard to the Springfield, or Transcona shops, Chairman Leonard, of the Transcontinental Railway Commission, has decided that the shops are not part of the contract between the Government and the railway, while the company contends that they are part of the Transcontinental contract. If Mr. Leonard's contention is eventually sustained, the taking over of the line between Winnipeg and Lake Superior Jct. would not include the taking over of the shops by the G.T.P. Ry. On the other hand, if the G.T.P. Ry.'s contention that the shops are a part of the Transcontinental Railway is sustained, the taking over of the line would also mean the taking over of the shops and placing them promptly in operation."

Canadian Northern Railway Earnings, Etc.

Gross earnings, working expenses, net profits, increases or decreases, compared with those for 1910-11, from July 1, 1911:—

Earnings.	Expenses.	Net Earnings.	Net Increase
July \$1,476,900	\$1,114,300	\$361,600	\$13,400
Aug. 1,420,600	1,105,900	314,700	51,700
Sept. 1,576,400	1,157,000	419,400	38,200
Oct. 2,028,900	1,348,500	680,400	99,900
Nov. 2,001,600	1,336,300	665,200	106,300
Dec. 1,831,400	1,227,600	603,800	144,600
Jan. 1,223,100	1,004,400	223,706	122,000
Feb. 1,203,400	965,800	237,600	101,800
Mar. 1,572,700	1,145,900	426,800	72,000
Apr. 1,608,100	1,205,000	403,100	42,000
May 1,822,100	1,364,000	458,100	54,900
June 1,769,500	1,347,800	421,700	103,500
\$10,538,600	\$14,422,500	\$5,116,100	\$950,300
Inc. \$1,399,100	\$3,388,800	\$50,300	

Average mileage in operation during 1911-1912, 3,885 miles, against 3,385 miles during 1910-11.

Approximate gross earnings for July, \$1,829,700, against \$1,475,900 for June, 1911.

Canadian Pacific Railway Earnings, Etc

Gross earnings, working expenses, net profits, increases or decreases, compared with those for 1910-11, from July 1, 1911:—

Earnings.	Expenses.	Net Profits.	Increases
July \$9,661,818.14	\$5,958,789.81	\$3,703,028.33	\$218,408.74
Aug. 10,411,904.42	6,346,338.41	4,075,571.01	388,898.68
Sept. 10,049,084.97	6,181,638.17	3,917,446.80	5,847.16
Oct. 11,207,901.99	6,526,887.24	4,631,104.75	175,944.23
Nov. 10,570,694.80	6,583,328.31	3,987,366.46	250,244.23
Dec. 10,654,871.67	6,549,141.41	4,105,730.26	819,196.37
Jan. 7,328,781.81	6,245,924.11	1,082,857.70	426,739.83
Feb. 8,931,907.20	6,548,040.53	2,338,866.67	1,239,159.16
Mar. 10,519,328.76	6,870,317.65	2,718,011.11	561,834.57
Apr. 11,301,349.46	7,185,597.67	4,115,751.79	958,777.18
May 11,360,420.81	7,679,905.58	3,680,515.23	736,480.47
June 11,311,397.20	7,464,794.51	3,846,602.69	821,931.64
\$123,319,541.23	\$80,021,298.40	\$43,298,242.83	\$6,598,412.26
Inc. \$19,151,733.02	\$12,553,320.76	\$6,598,412.26	

Approximate gross earnings for July, \$11,641,000 against \$9,291,000 for June, 1911.

The mileage in operation was increased, during July, to 11,152.

The net results of the company's operations for the year ended June 30, are as follows:—

Gross earnings	\$123,319,541
Working expenses	81,021,298
Net earnings	\$43,298,243
Net earnings of steamships in excess of amount included in monthly reports..	1,104,449
	\$44,402,692

Deduct fixed charges	10,524,937
Surplus	\$33,877,754
Deduct amount transferred to steamship replacement account	\$1,000,000
Deduct contribution to pension fund	125,000
	1,125,000
Net revenue available for dividend	\$32,752,754
Surplus carried forward after payment of all dividends declared for the year...	\$17,560,519
Special income from interest on land sales and from other extraneous assets..	\$5,158,585

Grand Trunk Railway Earnings, Etc.

Subject to audit, the accounts for the half year ended June 30, show the following results:—

Gross receipts	\$18,673,041
Working expenses	13,603,371
Net receipts	\$5,069,670
Deduct debit balance on account of rentals, outside operations and car mileage	163,145
Total net revenue	\$4,906,525
Net revenue charges	2,502,693
Balance	\$2,403,832
Deduct Canada Atlantic Ry. deficiency	\$257,136
and Detroit, Grand Haven and Milwaukee Ry. deficiency	246,909
	504,045
Surplus	\$1,899,787

This surplus of \$1,899,787 added to the balance of \$33,116 from Dec. 1911, makes a total of \$1,932,903 available for dividend, which will admit of the payment of full dividend for the half year on the 4% guaranteed stock and first and second preferred stocks, leaving a balance of about \$41,395 to be carried forward.

The accounts of the Grand Trunk Western Ry. for the year ended June 30, after providing for all fixed charges, including the debit balance of \$153,215, brought forward from the previous year, show a deficit of \$78,621, which will be carried forward to the current year.

TRAFFIC RECEIPTS OF THE SYSTEM.

Aggregate from July 1 to July 31:—	1912.	1911.	Increase
G.T.R.	\$3,689,098	\$3,339,247	\$349,851
C.A.R.	197,186	177,818	19,368
G.T.W.R.	573,014	551,903	21,111
D.G.H. & M.R.	185,752	171,322	14,430
Totals	\$4,645,050	\$4,240,290	\$404,760

Long Distance Non Stop Trains in Europe.

The longest nonstop trains run on European railways are in England, where there are 11 runs over 150 miles, three of which are over 200 miles (maximum 226), and the average speeds range from 50 to 53 m.p.h. for the entire distance. In Germany, there are five runs of over 150 miles (maximum 178), with speeds of 48½ to 53½ m.p.h. France has only one run of over 150 miles (158), with a speed of 53½ m.p.h. American railways rank much lower, the longest non-stop run being 141 miles, from Englewood (Chicago) to Fort Wayne, at 59 m.p.h. It is true that the timetables show runs as long as 438 miles, but these include actual stops to change engines, etc. The English runs are for regular trains, but some of the foreign long distance runs are special steamer trains or international express trains. The accompanying table gives particulars of some of the runs mentioned:—

Train runs	Distance miles	Time min.	Speed m.p.h.
England			
London-Plymouth	226.75	247	55.1
London-Rhyl	209.25	237	52.9
London-Shipley	206.50	245	50.6
London-Liverpool	192.25	215	53.6
London-Wilmslow	176.82	193	55.0
Wakefield-London	175.75	185	57.0
London-Exeter	173.75	180	57.9
Germany			
Berlin-Hamburg	178.20	200	53.4
Munich-Wurzburg	178.20	205	50.4
Berlin-Liegnitz	164.3	203	48.6
France			
Paris-Boulogne	157.8	170	55.7

W. J. GERBRACHT, travelling auditor, C.P.R., Nelson, B.C., was married, Aug. 8, to Miss C. M. Hyde, at Ingersoll, Ont.

RAILWAY DEVELOPMENT.

Projected Lines, Surveys, Construction, Betterments, Etc.

Alberta Interurban Ry.—We are officially advised that a subcontract for construction has been let to John Breckenridge, Calgary, Alta., and that work will be started as soon as the plans have been approved by the Board of Railway Commissioners. (July, pg. 339.)

Algoma Central and Hudson Bay Ry.—The Board of Railway Commissioners has approved of revised location plans for the extension of the line from Hobon, Ont., between mileage 82.8 and 123.53. (Aug., pg. 411.)

Atlantic, Quebec and Western Ry.—The Board of Railway Commissioners having authorized the opening for traffic of the line from Grand River to Gaspe, Que., mileage 51.5 to 102.5, a passenger train service was started Aug. 1. With the opening of this section of line, there is in operation a through line from Matapedia, on the Intercolonial Ry., to Gaspe, 202.5 miles, under one management. The first section of 100 miles from Matapedia to New Carlisle is the old Atlantic and Lake Superior Ry., now the Quebec Oriental Ry. (Aug., pg. 411.)

Burrard Inlet Tunnel and Bridge Co.—The Board of Railway Commissioners at Vancouver, July 28, directed the company to start work on the construction of the bridge within 30 days after the plans are approved by the Board's engineer.

At a meeting of directors, Aug. 7, a resolution was passed authorizing the company's consulting engineers in London, Eng., to have the complete plans and specifications for the bridge, with an opening span of 200 ft., in accordance with the orders of the Board, prepared as speedily as possible.

The company is being financed to a large extent by the municipalities, while the Vancouver, Westminster and Yukon Ry. has secured a Dominion subsidy towards building a bridge. The two companies agreed to consolidate interests so far as the bridge is concerned. Differences have arisen as to the location of the bridge, and the V. W. and Y. Ry. objects to the location on the ground that it is to be used for railway lines which will compete with those it proposed building. In giving a decision, Assistant Chief Commissioner Scott said the B. I. T. and B. Co. would have to compensate the V. W. and Y. Ry. for any cost to which it may be put in altering its plans to suit the revised location of the bridge. The application of the B. I. T. and B. Co. for approval of its line is to stand over for a year, it being understood that in the meantime the V. W. and Y. Ry. shall show some signs of activity. (Aug., pg. 411.)

Canada and Gulf Terminal Ry.—We are officially advised that surveys are being made with a view of immediate further construction from Matane, Que., towards Gaspé Basin, Que. The line is in operation from St. Flavie, on the Intercolonial Ry. to Matane, 34 miles. (May, pg. 238.)

Central Ry. of Canada.—W. D. Hogg and E. Wilson Smith, Montreal, are reported to have been elected directors in place of Hon. A. Campbell, Toronto, and E. Goff Penny, Montreal, resigned. Mr. Campbell was president of the company.

The Board of Railway Commissioners has authorized the Canadian Northern Ontario Ry. to build a spur line at McAlpine station, for use by the C. Ry. of Canada for construction purposes. (Aug., pg. 411.)

Dominion Atlantic Ry.—Press reports state that the C.P.R. proposes to spend over \$1,000,000 on betterments on the line. At present the bridge structures are being brought up to C.P.R. standard, some be-

ing rebuilt and others strengthened. Other betterments are being arranged for. (Aug., pg. 411.)

Edmonton, Dunvegan and British Columbia Ry.—The Board of Railway Commissioners has authorized the company to build its line across the Canadian Northern Ry. at grade in sec. 35-55-25, west of the 4th meridian, just south of Morinville, Alta., on installing an interlocking plant; and has also approved of location plans for the line from mileage 29.783 to 68.30 out of Edmonton. (Aug., pg. 411.)

Eric, London and Tillsonburg Ry.—The Board of Railway Commissioners has approved of location plans for this projected railway from mileage one, near Port Burwell, to Aylmer, Ont., at mileage 13.6. The Aylmer, Ont., town council is being asked to approve of the route through that town, the consent being asked for by W. H. Biggar, K.C., General Counsel, G.T.R. The charter for the E. L. and T. Ry. was obtained by J. H. Teall, of Tillsonburg, Ont., and it is reported that it was recently acquired by the G.T.R. (May, pg. 238.)

Esquimalt and Nanaimo Ry.—A new freight station has been completed at Duncans, B.C., and a new passenger station is under construction at the same place. The clearing of the line from Duncans to Cowichan Lake is in progress, the Island Lumber Co. having the contract.

R. Marpole, Vice President, and other officials, made a trip of inspection over the line, Aug. 2, including the extension to Cowichan Lake, and the branch to Osborne Bay.

Culliton Bros., Spokane, Wash., who have a contract for the first 10 miles north of McBride Jet., B.C., have been given another contract for a further five mile section. J. W. Hoard, Victoria, who has a contract for a five mile section from Trent River southwest, will probably be given a further five miles.

Fredericton and Grand Lake Coal and Ry. Co.—A plan of the proposed bridge across the Nashwaak River, and a description of the site has been deposited with the Registrar of the county of York, and application is being made to the Governor-in-Council for approval of the same.

The Minto Coal Co. has been incorporated under the New Brunswick Companies Act, with a capital of \$400,000 and offices at Minto, N.B., to develop collieries, and deal in coal, coke, etc. The company is given power to build tramways, piers, wharves, coal pockets, and to own steam and other vessels, etc. The provisional directors are:—Sir Thos. Tait, V. E. Mitchell, Montreal; A. H. Slipp, R. B. Harrison, Fredericton, N.B.; J. Henderson, Northfield, N.B. We are advised that it is not the company's intention to place any securities upon the market. (Aug., pg. 411.)

Howe Sound and Northern Ry.—See Pacific Great Eastern Ry. (June, pg. 300.)

Hudson Bay and Pacific Ry.—The creditors and shareholders of the H. B. and P. Development Co., London, Eng., on Aug. 7, nominated Sir W. B. Peat as liquidator. A London cable says: "The company's history really consisted of repeated attempts to borrow money. It was successful in borrowing a little, but had to pay an awful price for it." (Aug., pg. 411.)

Intercolonial Ry.—An order for 5,000 tons of 80 lb. steel rails has been placed with the Dominion Iron and Steel Co., Sydney, N.S.

A contract has been let to Morrison and Clark, Summerside, P.E.I., for the

erection of a 10-stall locomotive house and annex, brick chimney with concrete foundation, turntable ring wall and centre foundation, concrete cinder pit, and moving existing stores and office building and providing new foundation,—at Point Tupper, N.S.

J. H. Evans is reported to be making arrangements for a survey of the line from Point Tupper to Sydney, with the view of improving the alignment, cutting down gradients and eliminating curvature. Owing to the great increase in traffic since the line was originally built, it is stated that the management is desirous of securing a line which can be operated at less cost than the present one.

In connection with the proposal to build a line to Wallace Harbor, N.S., by the Cumberland Ry. and Coal Co., referred to in Canadian Railway and Marine World for August, we are officially advised that no actual work has been done. The Dominion Parliament last session granted \$60,000 to cover the cost of building a line from Wallace station to Wallace Harbor, three miles, it being understood that the Dominion Coal Co. is to build the necessary pier and coal handling plant, and that the Department of Public Works will do the necessary dredging of the harbor to permit of deep draught vessels reaching the site of the proposed pier. (Aug., pg. 411.)

Kettle Valley Lines.—An agreement has been concluded between the city council of Grand Forks, B.C., the Kettle River Valley Ry. and the C.P.R., under which the two railway companies will provide joint yards, shops, roundhouses, etc., in Grand Forks. The work, it is reported, will be started immediately.

Press reports state that the ballasting and other work on the section of the line under construction in the vicinity of Merritt, B.C., will be completed early in Oct. The work in progress consists of ballasting, the erection of station houses and the stringing of the telegraph line.

The Board of Railway Commissioners has approved of location plans for the extension of the line, between mileage 40 and 57.4, west of Hydraulic Summit, B.C. (Aug., pg. 412. See also Midway and Vernon Ry.)

Kootenay and Alberta Ry.—We are officially advised that construction on the line from near Pinetree station, on the C.P.R. Crownsnest Pass line, to Beaver Creek, Alta., has been completed. No arrangements have yet been made for its operation. (June, pg. 300.)

Midway and Vernon Ry.—The commission appointed by the British Columbia Government to settle up the claims against the old M. and V. Ry. in respect of the work done from Midway to Rock Creek, which has been taken over for the extension of the Kettle Valley Lines, has practically completed its work. The total amount awarded is about \$15,000, and Judge Foran of Nelson, the chairman of the commission, is reported as stating, Aug. 3, that the amounts awarded the several claimants would soon be paid over. One half of the total amount will be paid by the Provincial Government and the other by the Kettle River Valley Ry. This will close up the history of the M. and V. Ry. project. (May, 1910, pg. 353.)

Minneapolis, St. Louis and Canadian Ry.—The names mentioned in the incorporation papers for this new company are:—N. Erb, President, Minneapolis and St. Louis Rd.; W. G. Bierd, connected with the M. and St. L. Rd.; J. Wellman and H. A. Harrison, representing two New York banking houses. The organization meeting was held in Minneapolis, Minn., July 22, when N. Erb was elected President, and W. G. Bierd, Vice President. The President is reported as stating that preparation for construction of a line to the Canadian border would be started in the fall. (Aug., pg. 412.)

Minneapolis, St. Paul and Sault Ste. Marie Ry.—The new through line, giving a direct connection between Minneapolis, Superior and Duluth, Minn., was opened for traffic, Aug. 2. It starts from the main line at Dresser Jct., and passes through Frederic and Boylston Jct., Wis., connecting with the previously existing lines near Superior.

Press dispatches from Chicago, Ill., Aug. 12, state that announcement was made that day of the purchase by the Central Terminals Co. of parcels of land at a cost of \$1,719,153, in addition to the 208 already bought for terminals of the M. St. P. and S. S. M. Ry., which enters Chicago over the tracks of its subsidiary, the Wisconsin Central Ry. (Aug., pg. 412.)

North Ry.—It is reported that the sea terminal of this projected railway from Montreal to Hudson Bay will be on the west side of the Nottaway River, Que. The route from Montreal is via Ottawa and along the valley of the Coulonge River to Bell River, near which the National Transcontinental Railway will be crossed, and along the valley of the Nottaway River. Three engineering parties are in the field. (Aug., pg. 412.)

Pacific Great Eastern Ry.—The British Columbia Government has authorized the issue of the bonds, which it undertook to guarantee, and the construction of this railway from Vancouver to Fort George, B.C. Route maps of the line from Vancouver to Lillooet, 150 miles, have been filed with the Government. So far as they affect the city and the district of North Vancouver, they have been approved by the local municipalities, but West Vancouver has made an objection, with the result that the Government has held up the consideration of the matter so far as it affects that municipality.

The section of the general location of this projected railway approved by the Minister of Railways for British Columbia extends from the boundary of North Vancouver to the north boundary of the district of New Westminster, from D.L. 204 to Green River, north of D.L. 1276.

The question of terminals in North Vancouver is under consideration. The route map ties up with the line of the Howe Sound and Northern Ry., which the P.G.E.R. Co. has power to acquire, and negotiations for the purchase of that line have been resumed. J. Callaghan, Vancouver, is Chief Engineer.

P. Welch, Vice President, is quoted as stating, Aug. 7, that construction would be started early in September near the confluence of the Squamish and Cheakamus rivers, about 11 miles from Newport; that by the end of the year construction gangs would be at work along the line to Lillooet, 120 miles, and that in the spring construction would be started from Fort George southerly.

D'Arcy Tate, Vice President and General Counsel, is reported as stating, July 30, that satisfactory progress had been made with the negotiations for the purchase of the Howe Sound and Northern Ry., and he expected they would be closed soon after the arrival in Vancouver, during September, of J. W. Stewart, President, P. G. E. Ry., who is in Europe. In addition to a main line 12 miles long, now in operation, the Howe Sound road, of which Mr. Keith is President, has six miles of branch lines extending into logging camps in Squamish Valley. The southern terminus is Newport, at the head of Howe Sound. The company has a charter for a railway from Newport to Lillooet. The surveys have been completed and a subsidiary company also owns a charter for an extension from Lillooet to Fort George, following the same route as the Pacific Great Eastern.

P. Welch, Vice President, is reported as stating, Aug. 17, that orders have been given for grading outfits to be shipped in to Newport, and conveyed thence by rail to the point where it is proposed to

start construction. The right of way as far as Green Lake has been cleared, and it is expected that by the end of the year the 120 mile section to Lillooet will be covered with men. Engineers are making surveys for the line between Point Atkinson and Newport. Owing to the deep water close in shore it will be impossible to build bridges consequently there will be a good deal of tunnelling.

Quebec and Saguenay Ry.—Press reports state that, owing to the shortage of steel, the company will not be able to complete the laying of track to Murray Bay, Que., sufficiently early to enable to allow of the opening of the line for traffic this year, as was expected. (Aug., pg. 412.)

St. John and Quebec Ry.—A. R. Gould, President, is reported as stating, July 31, that there were over 1,000 men at work on the line between St. John and Grand Falls, N.B., and that good progress was being made with grading. (July, pg. 340.)

The Southampton Ry. is projected from Millville, N.B., on the C.P.R. Gibson branch, to Lower Southampton, on the St. John River, 13 miles. Six miles, from Millville to Pender's Mills, have been graded, track laid and ballasted complete, with the exception of dressing up. A daily train service is being given on this mileage. Grading has been nearly completed on the remaining seven miles to Southampton, and it is expected to have the work completed and the whole line in operation this season. The line is to be operated under lease by the C.P.R. D. W. Brown, Fredericton, N.B., is Chief Engineer. (Aug., pg. 412.)

Timiskaming and Northern Ontario Ry.—J. G. McMillan, who has made a report of his preliminary survey of the country between Cochrane and Moose River, has returned to complete his work. An engineering party, in charge of W. R. Mabey, is engaged in locating a line from Cochrane northerly, and, Aug. 5, was reported to be working between the Metagam and Frederickhouse rivers. J. L. Englehart, Chairman of the Commission, who returned to Toronto July 30 from an inspection of the line, is reported as stating that the work mentioned is being undertaken so that the Commission will have things in readiness should it be decided at the next session of the legislature to extend the line to Hudson Bay. (Aug., pg. 412.)

The Vancouver Terminals Co. submitted plans to the Vancouver city council, Aug. 2, for the laying out of extensive terminals. The details laid before the meeting by A. K. H. Macfarlane set out that the company proposes to build a line from New Westminster to Vancouver, and to lay out a railway terminal, with docks and harborage in Vancouver by the reclamation of Spanish Bank, and to lay out a central station and local freight yard in the heart of the city by the reclamation of 40 acres of False Creek under the Granville St. bridge. The plans show 12 miles of actual dock frontage, with the reclamation of 1,000 acres of land and provision for 150 miles of terminal trackage. The council promised to give consideration to the project at a future meeting.

Vancouver, Westminster and Yukon Ry.—See Burrard Inlet Tunnel and Bridge Co.

White Pass and Yukon Route.—We are officially advised that the branch line recently completed to the Pueblo mine leaves the main line 1,055 miles north of Skaguay, and extends 11 miles northwesterly in the Yukon Territory. The maximum gradient is 2.25% against northbound and 1.5% against southbound traffic, with a maximum curvature of 15 degrees. There are no tunnels, but there are seven wooden trestles. The entire traffic movement is southbound, and consists of ore. No further extensions are contemplated, and there is no construction in progress at present. (Aug., pg. 412.)

Railway Finance, Meetings, Etc.

Buffalo and Lake Huron Ry.—The report for the half year ended June 30 shows that after providing for the interest on the first and second mortgage bonds, and the usual dividend of 5s. 3d. a share, and making the necessary charges against revenue account, there remained a balance of £30 19s. 6d., which has been transferred to investment account. The railway is operated under lease by the G.T.R., on a half yearly rental of £35,000.

Canadian Pacific Ry.—Following the annual meeting of shareholders to be held in Montreal, Oct. 2, a special meeting will be held to authorize the issue of consolidated debenture stock to acquire the Dominion Atlantic Ry., as outstanding securities and to consider a recommendation from the directors to increase the capital stock by not exceeding \$60,000,000, such additional capital to be issued as may be determined by the directors.

Cap de la Madeleine Ry.—A meeting of shareholders will be held in Montreal, Sept. 3, to pass resolutions approving of the terms upon which the line is to be conveyed to the C.P.R.

Dominion Atlantic Ry.—Passenger earnings for July, \$119,895.38; freight earnings, \$38,472.43; total earnings, \$158,367.81, against \$160,600 total earnings for July, 1911.

Esquimaux and Nanaimo Ry.—Application is being made to the Board of Railway Commissioners for a recommendation to the Governor-in-Council to sanction a lease of the company's lines to the C.P.R. for 99 years from July 1, 1912.

Grand Trunk Ry.—Copy of the conditional sale of rolling stock between the American Car and Foundry Co. and the G.T.R., dated July 24, has been filed with the Secretary of State at Ottawa.

Kingston and Pembroke Ry.—The shareholders at the annual meeting at Kingston, Ont., Aug. 14, passed a resolution approving of the leasing of the line in perpetuity to the C.P.R. The terms and conditions of the lease were not made public. Before being final it will have to be ratified by the C. P. R. shareholders. Following are the directors for the current year:—President, W. D. Matthews, Toronto; Vice President and General Manager, W. R. Baker, Montreal; other directors, J. B. Walkem, W. F. Nickle, R. Crawford, W. Hart, Kingston, Ont.; H. P. Timmerman, A. R. Creelman, Montreal; J. T. Arundel, Toronto.

Nelson and Fort Sheppard Ry.—See Red Mountain Ry.

Quebec Central Ry.—Gross earnings for 12 months ended June 30, \$1,355,301, against \$1,208,948 for same period 1910-11.

Red Mountain Ry.—Nelson and Fort Sheppard Ry.—Vancouver press reports state that the C.P.R. held options, expiring Aug. 31, for the purchase from the Great Northern Ry., U.S., of the Red Mountain Ry. and the Nelson and Fort Sheppard Ry. in B.C.

St. Marys and Western Ontario Ry.—A special meeting of shareholders will be held in Montreal, Sept. 9, to consider the expediency of cancelling the present lease and entering into a new one upon terms to be submitted, and to decide upon the means to be adopted for raising funds.

Temiscouata Ry.—Profit on operation for May, \$5,871.

White Pass and Yukon Route.—Earnings for six months ended June 30, \$315,769, against \$397,130 for same period 1911.

S. Hale has been appointed General Manager of the Algoma Steel Corporation, Sault Ste. Marie, Ont.

Canadian Pacific Railway Construction, Betterments, Etc.

Elevator at St. John.—Work has been started upon the preparation of the foundations for the new 1,000,000 bush elevator at West St. John, N.B., to the west of the existing elevator. The new building will be of reinforced concrete and will be capable of unloading 160 cars in ten hours, and, by means of a shipping gallery system, of loading into vessels lying at different berths. The machinery will be operated by electricity. The new elevator is to be completed for the winter of 1913. The John S. Metcalf Co., Montreal, has the contract for the design and construction.

Farnham Subdivision Second Track.—The Board of Railway Commissioners has authorized the revision of grade of the present main line, and the building of a second track from mileage 17.35 on the Farnham subdivision to Iperville Jct., and thence to Highlands, Que., mileage 41.8.

Quebec Yards, etc.—A new plan covering the portion of Victoria Park required by the C.P.R. for yard extension purposes is under consideration by the city council. There will not be so much encroachment on the park with this plan as under the plan first considered.

Windsor St. Station, Montreal.—Two of the new tracks at this enlarged station, have been in use since Aug. 1, and a third track was expected to be ready by Aug. 31.

Ottawa Improvements.—D. McNicoll, Vice President, is reported as stating that work will be started early in the spring of 1913, improving the entrance of the company's lines into Ottawa, and that some detail matters have to be settled before the plans can be finally approved.

Campbellford, Lake Ontario and Western Ry.—A special meeting of shareholders will be held in Montreal, Sept. 9, to approve of a lease of the line to the C.P.R., and to take steps for raising funds to construct and equip the line.

The Board of Railway Commissioners has authorized the changes in the line at mileage 43.86, and a crossing of the Bay of Quinte Ry.; has approved location plans from King St., Port Hope to mileage 127.3; through the town of Whitby; from mileage 160.86 to 161.0; from mileage 165 to 174, and from 176.0 to 183.51; revised location plans from mileage 63.59 to 68.50, from mileage 70.25 to 72.44, and from mileage 155.13 to 157; has authorized the crossing of the Oshawa Electric Ry. at mileage 158.85; and has authorized a junction to be made with the C.P.R. Montreal-Toronto line at mileage 87.41 westerly from Havelock, Ont., mileage 183.51 of the C. L. O. & W. Ry.

Construction is being rapidly proceeded with and it is expected to have the section from Leaside Jct. to Whitby completed this year. Just east of Whitby there will be a bridge across Ruffins creek, 900 feet long, and 110 feet above high water level.

North Toronto Improvements.—The tenants of the buildings and land on the line of the track elevation in North Toronto, were notified Aug. 1 to vacate immediately. Large quantities of materials are being delivered, and a good deal of other preparatory work is being gone on with. The company's engineers have opened an office at the corner of McPherson Ave. and Avenue Road from which the construction work will be directed. The project comprises a viaduct across Yonge street, a union station, and track elevation westerly to Dovercourt Road.

Islington West.—The second track out of Toronto, ends a short distance west of Islington. A survey party under the direction of H. D. Lumsden, started in at

this point Aug. 6, and is working westerly. There have been a number of surveys made in this vicinity within the last six or seven years with the view of eliminating the Erindale gradient, and cutting out the long curve round to Streetsville Jct., as well as surveys for a second track, and for a line connecting the Toronto-Windsor line, with the Sudbury line to the north and Hamilton to the south.

Woodstock Line Revision.—The Board of Railway Commissioners has authorized the revision of the line through Woodstock, Ont., a subway to be built under Dundas St. Twenty per cent. of the cost of the subway is to be paid out of the Dominion railway grade crossing fund.

Collingwood Southern Ry.—Local press reports state that the company's agents have secured most of the right of way from Baxter on the Toronto-Sudbury line to Collingwood, and that a start will be made with construction early in September. Representatives of the Dominion Construction Co. are said to have been going over the located route Aug. 6.

Sudbury-Port Arthur Second Track.—Press reports state that subcontracts on the several sections of this work which has been put under contract to the Dominion Construction Co., have been let to McCaffrey and McCaffrey, W. T. S. Tomlinson, A. and A. Zebron, M. McCormick, Welsh Bros.

Fort William-Winnipeg Second Track.—The Board of Railway Commissioners has authorized the opening for traffic of the second track on the Kenora, Ont., subdivision, from mileage 114.54 to 119.06.

North Transcona Terminals.—Construction has been started on the new terminals at North Transcona, near Winnipeg. The contract for grading and track laying has been let to Foley Bros., Welch and Stewart, and it is expected to complete about 750,000 cubic yards of levelling and grading, and to lay 35 miles of track this year. By the fall of 1913 it is expected to have the eastbound and westbound yards completed. This will require about 2,000,000 cubic yards of levelling and grading, and about 70 miles of track. A 30 stall locomotive house, together with machine shop, boiler house, stores, etc., are being constructed, the contract for which has been let to the Lyall-Mitchell Contracting Co. There is also under construction a transfer elevator with a storage capacity of 1,000,000 bush, with a grain drier and the usual elevator facilities. Details of this elevator, which is being built by Barnett, McQueen & Co., were given in Canadian Railway and Marine World for July.

Gimli Branch Extension.—Press reports state that a contract has been let to T. Ingaldson, Arberg, Man., for the clearing of the right of way for the extension of the branch now terminating at Gimli, along the shore of Lake Winnipeg, for 26 miles to Riverton, on the Icelandic river. Work is reported to be in progress.

Moose Jaw Southwesterly.—We are officially advised that the extension of the branch running southwesterly from Moose Jaw, Sask., which now terminates at mileage 37.85, will not be gone on with this year. The route of the extension has been approved for 16.62 miles.

Swift Current Northwesterly.—This line is already in operation from Swift Current northwesterly to beyond Cabri, Sask., 34 miles. The route plan, recently approved by the Minister of Railways, shows an extension to the Saskatchewan Alberta boundary immediately south of the south Saskatchewan river. This extension is being built this year.

Ogden Shops, Calgary.—We are officially advised that excellent progress is being made with the erection of the shops at Calgary, Alta., a complete preliminary description of which, with plan, was published in Canadian Railway and Marine World for February.

The locomotive shop, boiler shop and blacksmith shop are erected; the roof sheathing has been put on, and the roof waterproofing is being applied; building walls are being laid up; concrete erecting pits have been put in, heating ducts in five buildings are being constructed, and the contractors are ready to put in machine tool foundations.

The coach repair and paint shop and the tender shop and planing mill are enclosed; the storehouse and office building and the foundry are being erected; the yard crane runway has been erected; foundations are in place for the power house and the freight car shop, and these structures are being erected; sewer and water piping have been installed in the shop yards, and the grading of the property is going ahead, there being considerable cuts and fills, requiring the services of two steam shovels on the site.

The contractor, Westinghouse, Church, Kerr & Co., expected to continue the present progress of the work to an early completion.

Calgary Irrigation Belt Lines.—In connection with the opening up of the lands in the irrigation belt, easterly of Calgary, a line was built northerly from Langdon to Acme, with a branch from Irricana easterly and southerly through Tudor. This branch is being extended to Dead Horse Lake and then south-easterly to a junction with the main line at Bassano. The track laying gang was reported Aug 7 to be nearing Bassano, and it was expected to have the steel laid by Aug. 31.

Alberta Central Ry.—The amended route map of this line from Rocky Mountain House to the Yellowhead Pass, is projected to give a 0.4 gradient throughout. The previously located line is followed to 140 miles from Red Deer, a few miles beyond the point from which a branch line is located southwesterly to the Brazeau collieries. The line first located from the 140 mile post proceeded almost due westerly to the Pass, but it was found to be impracticable to obtain a 0.4 gradient on it without a series of further gradients and considerable tunnelling. The route now adopted, although very much longer, has an advantage of a 0.4 gradient all the way, easy of construction and traverses more directly the extensive coal fields of the Brazeau district. It runs northerly from the 140th mile post in tp. 44, range 16, west of the 5th meridian, and enters the Athabasca river valley about 50 miles west of Edson on the G. T. Pacific Ry., and follows the route of that line and the Canadian Northern Ry. from this point to the Yellowhead Pass in tp. 45, range 4, west of the 6th meridian. J. Grant MacGregor is assistant engineer in charge of construction.

Grand Forks, B.C.—The agreement between the city council, the C.P.R. and the Kettle Valley Lines, by which the railway companies will erect joint terminals in Grand Forks, B.C., awaits the sanction of the ratepayers. Preparations are being made for starting work.

Rossland Branch Electrification.—In connection with the announcement that the C.P.R. purposed electrifying its line from Nelson to Rossland, B.C., the West Kootenay Power and Light Co. proposes to enlarge its power plant. This company controls 30,000 of the 35,000 estimated horse power that may be developed at Bonnington Falls. With the completion of the improvements contemplated the company will have 19,000 h.p. available.

Coquitlam Terminals.—Rapid progress has been made with the erection of the

terminal buildings at Coquitlam, B.C. It is expected that the locomotive house will be completed early in September. The shunting yard is being laid out on the hump principle, with 10 tracks running west and 17 east. The tracks stretch from the Pitt river to Coquitlam. Other trackage is being laid down. Tenders are being asked for a three-track bridge across the Coquitlam river, and surveys are being made for the erection of a double track bridge across the Pitt river, in connection with the company's plans for the terminals.

Ruby Creek-Vancouver Second Track.—The construction of a second track from Hammond to Vancouver, B.C., 24 miles, is reported to be practically completed. The work is being carried out under the charge of H. Kindal, division engineer, Vancouver.

We are officially advised that Grant Smith and Co. have been given a contract for building a second track from Ruby Creek to Hammond, 57 miles, which will give a continuous second track to Ruby Creek from Vancouver, 81.1 miles.

Burrard Inlet Line.—We are officially advised that while the Minister of Railways has approved, with certain restrictions, the route map of the proposed line along the north shore of Burrard Inlet, the location plans are not yet finally settled. It is not, we are informed, the intention to proceed with the construction of the line under present circumstances. The route plan approved by the Minister of Railways shows a line of 21 miles from mileage 115 of the Cascade subdivision to North Vancouver

Manufacturers Urged to Load and Unload Cars Promptly.

J. E. Walsh, Manager Transportation Department, Canadian Manufacturers Association, has issued the following circular to members:—

Notwithstanding the fact that the railways are adding materially to their equipment and terminals, the indications are that the car shortage and congestion at terminals is going to be worse this fall than for some years past. This statement is based on the car surplus and shortage figures of the American Railway Association.

Upon the ability of the railways to move the crops promptly will depend to a great extent the business welfare of the country. Everybody can help by facilitating the movement of any cars he consigns or receives, viz., by loading and unloading as expeditiously as possible. Every time the loading or unloading of a car is needlessly delayed the available supply of cars is correspondingly reduced. If a shipper by his own act reduces the available supply of cars he cannot very well complain of a shortage. Cars are furnished for transportation, not for storage, and every one used for storage reduces the number available for transportation.

The annual crop movement beginning around October 1st brings a car shortage lasting about four months; during the balance of the year there is usually a surplus. By moving as much as possible of your freight inwards and outwards within the next few weeks you will be helping yourself, the railways, and all others concerned.

The C. P. R. has entered an action against the G.T.R., at Osgoode Hall, Toronto, to recover \$2,277.28 alleged to be due as the result of a derailment at Woodstock, Ont. The claim is made up of, damage to equipment, \$775.30; clearing wreckage and repairing track \$164.18, and \$726.03 alleged to have been paid to the Pere Marquette Rd. for taking C. P. R. trains over its line. The derailment in question occurred in Dec., 1910.

Railway Rolling Stock Notes.

The Central Ontario Ry. has ordered 25 ore cars from J. T. Gardner, Chicago, Ill.

The Canadian Northern Ry. will probably be in the market shortly for between 3,000 and 4,000 freight cars.

The Canadian Northern Ontario Ry. has ordered 50 coal cars from J. T. Gardner, Chicago, Ill.

The Duluth, Winnipeg and Pacific Ry. has received 150 coal cars, from J. T. Gardner, Chicago, Ill.

The Halifax and South Western Ry. has ordered six excursion cars from J. T. Gardner, Chicago, Ill.

The Niagara, St. Catharines and Toronto Ry. has ordered 10 coal cars from J. T. Gardner, Chicago, Ill.

A United States press report states that the G.T.R. has ordered 2,000 thirty ton box cars and 50 tank cars, in the U.S.

The Dominion Bridge Co. has received one Lidgetwood unloader from the Canadian Car and Foundry Co., Montreal.

The Intercolonial Ry. has received one first-class car from the Preston Car and Coach Co., completing an order of five.

The Algoma Central and Hudson Bay Ry. has received four first class cars from the Canadian Car and Foundry Co., Montreal.

The Canadian Car and Foundry Co., Montreal has delivered one logging engine car to Allis-Chalmers-Bullock Ltd., Montreal.

The Canadian Northern Quebec Ry. has ordered 50 coal cars, 50 flat cars and six excursion cars from J. T. Gardner, Chicago, Ill.

The Brockville, Westport and North Western Ry. has ordered two first class cars and one combination car from J. T. Gardner, Chicago, Ill.

The Timiskaming and Northern Ontario Ry. has received two consolidation locomotives, Nos. 139 and 140, from the Canadian Locomotive Co.

The Grand Trunk Pacific Ry. has received 173 ballast cars, nos. 392820 to 392992, from the Canadian Car and Foundry Co., Montreal; and 256 flat cars, nos. 361642 to 361897, from the American Car and Foundry Co.

The G. T. R., between July 13 and Aug. 15, received three Pacific type locomotives, nos. 230 to 232, ordered Oct. 7, 1911, and two first class cars, from its Montreal shops; and 46 refrigerator cars, 157 automobile cars and 457 steel coal cars, from the U.S.

The Canadian Northern Ry. has ordered two cafe-parlor cars, from J. T. Gardner, Chicago, Ill.; four Pacific type locomotives, from the Montreal Locomotive Works, and 25 consolidation locomotives, from the Canada Foundry Co., Toronto, and is in the market for 50 or more additional locomotives.

The Reid Newfoundland Co. will complete the order for eight locomotives, placed last year at its shops at St. John's, before the end of this year. We have already given details of these. Four have been completed, a fifth was expected to be ready by Aug. 31, and the remaining are to be finished during the next four months.

J. H. Corbett and Sons Co., contractors, National Transcontinental Ry., Moncton, N.B., have ordered one Rodger double plough distributing car from the Hart-Otis Car Co., Montreal. Following are the chief dimensions:—

Capacity 30 tons
Length over end sills 32 ft.
Width over side sills 8 ft. 9 ins.
Height from rail to floor 4 ft. 1 1/4 ins.
Track centres 23 ft. 8 ins.
Wheel base of truck 5 ft. 2 ins.

Following are the chief details of the 60 logging cars which the C.P.R. recently

ordered for the Esquimalt and Nanaimo Ry.'s Cowichan Lake branch, as mentioned in a previous issue:—

Capacity 80,000 lbs.
Length over end sills 41 ft.
Wheel base, extreme 36 ft. by 5 ins.
Truck centres 31 ft. 2 ins.
Truck, type 40 ton
Truck wheel base 5 ft. 4 ins.
Truck bolsters Simplex
Width, over floor 9 ft.
Width over side sills 8 ft. 10 ins.

The Canadian Northern Ry., between July 15 and Aug. 15, received the following additions to rolling stock,—four consolidation locomotives, from the Canadian Locomotive Co.; two consolidation locomotives, from the Canada Foundry Co.; four first class cars, three second class cars, one dining car, three baggage cars and 140 box cars, from the Canadian Car and Foundry Co.; two baggage and mail cars and 80 box cars, from the Crossen Car Co.; and 40 box cars, from the Nova Scotia Car Works.

The C.P.R., between July 17 and Aug. 15, ordered the following rolling stock,—10 sleeping cars, five dining cars, 10 tourist cars, two double track snow ploughs, one double track flanger, and 20 type D.4 locomotives, from its Angus shops, Montreal; 13 steel snow ploughs, from the Canadian Car and Foundry Co., and 5,000 steel frame box cars, from Barney and Smith Car Co., Dayton, Ohio. We have been further officially advised that 6,000 standard steel frame box cars have been ordered from the Canadian Car and Foundry Co., for delivery by July 31, 1913.

The C.P.R., between July 17 and Aug. 15, received the following additions to rolling stock,—21 freight refrigerator cars, 25 stock cars, 50 vans, 587 wooden box cars, one pile driver, 12 tourist cars, 20 suburban cars, five U.3 switching locomotives, and three P.1 locomotives, from its Angus shops, Montreal; 177 steel frame box cars, 167 coal cars and 173 ballast cars, from the Canadian Car and Foundry Co., 20 dump cars, from the Hart-Otis Car Co.; 16 ballast ploughs and one Jordan ballast spreader, from F. H. Hopkins and Co., and 86 stone cars, from the Nova Scotia Car Works.

Following are chief details of the 41 Pacific type locomotives which the G. T. R. is having built by the Montreal Locomotive Works, as mentioned in previous issues:—

Cylinders, diam. and stroke 23 by 28 ins.
Driving wheels, diam. 31-69 ins.; 10-73 ins.
Boiler, outside, diam. first course 70 1/2 ins.
Firebox, length and width inside 96 3/4 by 75 1/4 ins.
Tubes, no. and diam. 181—2 ins.; 24—3 3/4 ins.
Tubes, length 20 ft. 7 ins.
Grate, area 60.6 sq. ft.
Wheel base, driving 33 ft. 4 ins.
Wheel base, engine 33 ft. 2 ins.
Wheel base, engine and tender 62 ft. 3 1/2 ins.
Weight on leading truck 40,000 lbs.
Weight on drivers 145,000 lbs.
Weight on trailing truck 38,000 lbs.
Weight, total engine 223,000 lbs.
Weight of tender 144,600 lbs.
Capacity, water 8,000 U.S. gals.
Capacity, coal 10 tons
Superheater, type Top header, double loop

Following are chief details of the one G.1 locomotive which the C. P. R. is building at its Angus shops, Montreal, as mentioned in our last issue:—

Weight on drivers 136,000 lbs.
Weight, total 217,000 lbs.
Cylinders, diam. and stroke 21 by 28 ins.
Valves, diam. and type 11 ins. piston
Drivers, diam. 75 ins.
Boiler, type Extended wagon top
Boiler pressure 200 lbs.
Heating surface, tubes 2,777 sq. ft.
Heating surface, firebox 183 sq. ft.
Heating surface, total 2,960 sq. ft.
Heating surface, superheater 539 sq. ft.
Equivalent heating surface 3,767 sq. ft.
Tubes, no. and size 193—2 1/4; 22-5 1/4 ins.
Tubes, length 19 ft. 4 7/8 ins.
Firebox, type Radial stay with cross stay
Firebox, dimensions 7 ft. 8 1/2 ins. by 5 ft. 9 7/8 ins.
Grate area 45.6 sq. ft.
Capacity, coal 10 tons

Capacity, water 5,000 gals.
 Axles main 9½ by 12 ins.; others 9 by 12 ins.
 Brakes Westinghouse, E.T. 6
 Brake beams Simplex outside hung
 Valve gear Walschaert
 Superheater Vaughan and Horsey
 Wheel centres cast steel

Following are chief details of the 19 Pacific type locomotives which the G. T. R. is having built by the Baldwin Locomotive Works, Philadelphia, Pa., as mentioned in previous issues:—

Cylinders, diar. and stroke 23 by 28 ins.
 Valves, type Piston
 Boiler, type Straight
 Boiler, pressure 185 lbs.
 Boiler staying Radial
 Firebox, length and width 96% by 75¼ ins.
 Tubes, no. and diar. 181—2 ins.; 24—5¾ ins.
 Tubes, length 20 ft. 7 ins.
 Driving wheels, outside diar. 69 ins.
 Journals 9½ by 12 ins.
 Truck wheels, front, diar. 31 ins.
 Truck wheels, back, diar. 49 ins.
 Wheel base, driving 13 ft. 4 ins.
 Wheel base, total engine 33 ft. 2 ins.
 Wheel base, engine and tender 62 ft. 3½ ins.
 Weight on drivers 145,000 lbs.
 Weight on front truck 40,000 lbs.
 Weight on back truck 38,000 lbs.
 Weight, total engine 223,000 lbs.
 Weight, total engine and tender 368,000 lbs.
 Tender, wheels, diar. 34 ins.
 Journals 5½ by 10 ins.

Capacity, water 8,000 gals.
 Capacity, coal 10 tons
 Superheater Schmidt

Following the chief details of the 20 ten wheel locomotives, class D.4g., which the C.P.R. are building at it Angus shops, Montreal:—

Weight on drivers 103,000 lbs.
 Weight, total 142,000 lbs.
 Cylinders, diar. and stroke 19 by 24 ins.
 Valves, diar. and type 11 ins. piston
 Drivers, diar. 62 ins.
 Boiler, type Extended wagon top
 Boiler pressure 180 lbs.
 Heating surface, tubes 925 sq. ft.
 Heating surface, firebox 143 sq. ft.
 Heating surface, total 1068 sq. ft.
 Heating surface, superheater 231 sq. ft.
 Heating surface, equivalent 1414 sq. ft.
 Tubes, no. and size 117-2 ins.; 18-5 ins.
 Tubes, length 10 ft. 11-16 ins.
 Firebox, length, width, 8 ft. 3¾ ins. by 3 ft. 5¾ ins.
 Firebox, material and make Otis firebox steel
 Grate area 28 sq. ft.
 Tank capacity, water 4,000 imp. gals.
 Tank capacity, coal 10 tons
 Axles main 8½ by 8½ ins., others 8 by 8½ ins.
 Brakes Westinghouse, E.T.6.
 Brake beams, tender Simplex trns, inside hung
 Couplers Tower
 Headlights Oil, C.P.R. Standard
 Steam heating Gold with Leslie reducing valves
 Superheater Vaughan and Horsey
 Wheel centres main, cast steel; others, cast iron

been completed, and when the train filling is finished, new 80 lb. steel rails will be laid, so as to make the line conform to the general standard of construction. It is expected to have this work completed this season.

The steel work for the two bridges across Sydenham Lake is being erected. Grading is practically completed to Chaffey's locks. Considerable grading has been done right on to Ottawa, and track has been laid out of Ottawa to Hog's Back, where the line to Port Arthur branches off.

Plans are reported to be in preparation for laying out a terminal site on the north side of the Rideau River.

Sir Wm. Mackenzie, President, and D. B. Hanna, Third Vice President, were in London, Ont., Aug. 14, and discussed railway matters with the Mayor, who subsequently stated that the C.N.O. Ry. would come to London but beyond that it was impossible to say anything at present. The company's engineers are making surveys.

Canadian Northern Ry.—The company has given the Barnett and McQueen Co. a contract for an extension to its Port Arthur elevators, which will increase the capacity by 2,500,000 bush.

The plans for the cut-off from near River Park to the main line east of Winnipeg came before the Board of Railway Commissioners, Aug. 7. An inspection of the route was made, owing to the objection of residents, and the Board directed its engineer, H. A. K. Drury, to make a special survey and see whether any other route could be adopted which would serve the railway equally well and do less damage to property.

The extension of the Bird's Hill branch along the eastern shore of Lake Winnipeg to Fort Alexander, Man., is under construction. The grading is reported to have been completed from near the East Kildonan carline to Balsam Bay, whence it will run in an almost straight line to Fort Alexander. Press reports state that a hydro-electric power plant is to be developed at Bonnet Falls, north of Fort Alexander, and that the branch will be operated by electricity.

Hon. F. Cochrane, Minister of Railways, is reported as stating that the Dominion Government has offered to guarantee the company's bonds to aid in the building of a line from Prince Albert, Sask., to a junction with the line to Hudson Bay, near Split Lake.

Press reports state that construction is being proceeded with on a branch line from Laird, Sask., northerly for about 12 miles to Carlton.

We are officially advised that a contract has been awarded to the Northern Construction Co. for the work on the Calgary-Macleod branch, south of Calgary, Alta.

Canadian Northern Pacific Ry.—Twohy Bros., Spokane, Wash., have been given a sub-contract by the Northern Construction Co., and Cowan Construction Co., for 100 miles north from Kamloops, mileage 60 to 160.

The Premier of British Columbia returned to Vancouver, Aug. 2, after a trip over the line under construction as far east of Kamloops. He is reported as stating that 82 miles of the line easterly from Kamloops have been completed, and that the bridges are expected to be completed within a year. The whole of the line is under contract to the Yellowhead Pass, and construction is being progressed with almost throughout the whole mileage.

The branch line projected from Kamloops to Vernon, B.C., will be about 85 miles long; the extension from Vernon to Kelowna 30 miles, and the extension from Vernon to Lumby, 14 miles. It is being laid out as a steam line. Prospective contractors are inspecting the ground with a view of tendering, as soon as the

Canadian Northern Railway Construction, Betterments, etc.

Canadian Northern Quebec Ry.—The locomotive house and machine shop at Limoilou, Que., are well advanced to completion, and work has been started on the erection of the car shops adjoining. A number of houses have been removed to make room for the approaches to the shops and the yard surrounding them which is to be laid out.

The company has started the laying of a permanent branch into the exhibition grounds at Quebec, on a right of way granted by the city.

The route map for a line from St. Jerome Jct., southerly through the counties of Two Mountains and Terrebonne to a junction with the line under construction from Hawkesbury to Montreal, near St. Eustache, has been approved by the Minister of Railways. After the old Montford and Gatineau Colonization Ry. was acquired by the C. N. Q. Ry. it was extended southerly from near Montford to St. Jerome, and the proposed line will give a direct connection with Montreal.

Montreal Tunnel and Terminal Construction.—Sir Donald Mann, recently laid before the Montreal board of control a complete statement of the company's plans for its lines in the city. From the tunnel portal within the city there will be a viaduct extending about 1,600 yards to the waterfront. The viaduct is an essential part of the company's plans, without it there would not be station facilities in the lower part of the city accessible to the business and financial districts; a local yard for light and perishable freight convenient to the produce and wholesale districts, and adjacent to facilities at present used for this purpose by another company, and a direct connection with the Harbor Commissioners, tracking along the river front. The viaduct would pass over land owned by the company, coming into view at the street crossings in the business sections upon ornamental bridges designed to give absolutely no interference with street traffic. The trains would all be operated by electricity. These plans are under consideration. In a report to the city council Aug. 10, the board of control expressed opposition to the level crossings and to certain other points in the plans of the company's line from the tunnel portal on the Outremont side to the present station in the east end of the city.

Sir Donald Mann was in Montreal Aug. 13 inspecting the work being done on the northern end of the tunnel. Some 205

feet have been driven and timbered. The rock has been reached and a drilling plant is being installed.

Montreal-Ottawa-Port Arthur Line.—Sir Donald Mann is quoted as stating in Montreal, Aug. 15, that construction work is being proceeded with on the two bridges across the Back river. One of them is nearly completed, and considerable work has been done on the second. These bridges are on the new short line to Hawkesbury, Ont., which is expected to be completed this year. The line from Hawkesbury to Ottawa is already in operation.

Construction has been started on the section of the line from just outside Ottawa towards Pembroke, Ont. The work starts at Hog's Back, and the route is through Fitzroy Harbor, and Portage du Fort, but does not run into Pembroke. It crosses the C.P.R. in Pembroke township, and the G. T. R. in Stafford township and then follows the valley of the Tichon river for a considerable distance.

The Board of Railway Commissioners has approved of revised location maps for the line through Beauceage, Boulter, Lander, Pentland, Master, Stratton and Barron tps. Nipissing district, and through unsurveyed territory in Sudbury and Algoma districts.

Track is reported to have been laid easterly from Port Arthur to McKenzie river, where a large steel bridge is to be built. A temporary trestle has been built for construction purposes, pending the erection next year of the permanent bridge.

Canadian Northern Ontario Ry.—The line from Toronto to Ottawa is being operated as far as Deseronto, where connection is made with the Bay of Quinte Ry., and the section of that line from Deseronto to Sydenham, 29.7 miles, has been incorporated into the line. There were gradients as high as 1.75% on the B. of Q. R., and to overcome these, revisions have been made at Newbury, three miles long; at Yarker, one mile long; and at Sydenham, 2.5 miles long, reducing the gradient to 0.5 and making it uniform with the whole line from Toronto to Ottawa. Between the points where revisions were made a considerable amount of train filling is being done, and when this is completed there will be no gradients exceeding 0.5%. At Yarker it was necessary to build a bridge over the Napanee River, 400 ft. long, and 37 ft. above high water. The revision work has

location is completed, which we are officially advised should be within a few weeks.

We are officially advised that no plans have yet been decided on for a comprehensive lay-out of the terminal yards at Port Mann, B.C. The Northern Construction Co. is grading and laying out such part of the yard as will be required in the immediate future. Meantime the rest of the lay-out is under consideration.

Recent press reports stated that the C.N.P. Ry. had acquired a railway running between New Westminster and Hazelmer, which would give a through line to New Westminster via Port Mann. We are advised, in this connection, that the company is negotiating with the Great Northern Ry. for acquiring the right of way of the old New Westminster Southern Ry. between Port Mann and Port Kells.

James J. Hill on the History of the Great Northern Railway.

On retiring recently from the chairmanship of the board, Great Northern Ry., J. J. Hill issued a circular to the shareholders, which contains a lot of interesting matter about northwestern railway development. Following are extracts:

Nearly 40 years ago the thought of a possible railway enterprise in the northwest began to occupy my mind. It was born of experience in northwestern transportation problems that had occupied most of my early business life, of faith in the productive powers and material resources of this part of the country, and of railroad conditions at that time. The feverish activity in securing railway concessions in land and cash that marked the sixth decade of the last century had been followed by collapse. Doomed as these enterprises were to ultimate failure by their lack of commercial foundation and financial soundness, they were suddenly wrecked by the panic of 1873. Aside from the Northern Pacific property, the lines in Minnesota most important and available if converted into real assets for the development of the northwest were the fragments of the old St. Paul & Pacific Co. Following the panic of 1873 these were in the hands of a receiver. The holders of their securities in Holland were more anxious to recover what they could from the wreck than to put more money into its completion and improvements that must be made if the properties were to continue to be operated at all. Their value lay to some extent in what was left of a land grant, which would be valuable as soon as the country should be opened, but chiefly in the possibilities of traffic from the millions of productive acres in the northwest to be opened to settlement by transportation facilities. Yet so great seemed the task and so uncertain the reward, in the general opinion, that any plan of acquiring and reorganizing the property was regarded as visionary in those days by most holders of capital and most men of affairs.

After long and close study of the situation the slender beginning was made on which we risked our all. Failure would be immediate and final disaster. My associates were Geo. Stephen, now Lord Mount Stephen, Donald A. Smith, now Lord Strathcona, and N. W. Kittson. We bought the defaulted bonds of these properties from the Dutch holders. The agreement with the Dutch committee was executed March 13, 1878, and practically all outstanding indebtedness was subsequently secured. The mortgages were afterwards foreclosed and the property was bought in. For those days it seemed a formidable financial undertaking. The stock of these companies aggregated \$6,500,000, and their bonded indebtedness with past due interest

H. K. Wicksteed, Chief Engineer of Surveys for Mackenzie, Mann & Co., arrived in Vancouver, July 30, and spent nearly three weeks inspecting the lines under construction, and in going over plans for the company's extensive development projects in the vicinity.

Press reports state that a contract has been let to Rigby and Marsden, Vancouver, for the building of eight steel bridges on the line east of Yale, B.C.

Vancouver Island.—Tenders are under consideration for building a further section of 40 miles of the line on Vancouver Island. The section extends from mile-age 100, west of Cowichan Lake, to the Alberin canal, and is styled Division D. The work includes clearing, grubbing, grading, fencing, and the building of bridges, trestles, culverts and masonry. It is to be completed within a year from the signing of the contract.

nearly \$33,000,000, aside from floating obligations. These had to be purchased at prices above those for which they had previously been offered in the open market. The total capitalization and indebtedness at that time of the companies taken over was approximately \$44,000,000.

The property secured consisted of completed lines from St. Paul via St. Anthony to Melrose, 104 miles, and from Minneapolis to Breckenridge, 207 miles; and of two projected lines, one from Sauk Rapids to Brainerd and one from Melrose to the Red River at St. Vincent on the international boundary line. On these latter some grading had been done and about 75 miles of track had been laid. There were gaps between Melrose and Barnesville, Crookston and St. Vincent, that must be filled quickly. In themselves, had it not been for the promise of the future, these were scattered tracks in a country just being settled, out of which to construct a railway system and on which to base the financing of their purchase and development.

We advanced the money to build the Red River Valley Rd., 14 miles of track from Crookston to Fisher's Landing, on the Red River, making a through route by steamboat from that point to Winnipeg. While negotiations were pending and also after they were concluded, but before possession could be secured through the foreclosure of mortgages, an immense amount of work had to be done. The extension from Melrose to Barnesville must be pushed, and was carried 33 miles, as far as Alexandria; and 90 miles were built in the Red River Valley to reach the Canadian boundary. The former was necessary to save the land grant, whose time limit, already extended, was about to expire. The latter was in addition to connect with a railway projected by the Canadian government from Winnipeg south. As the properties were still in the hands of a receiver, an order had to be obtained from the court for the completion of the work in Minnesota with funds furnished by us. Money had to be raised to build these lines and to furnish equipment necessary for their operation.

In May, 1879, the St. Paul, Minneapolis & Manitoba Ry. Co. was organized to take over all these properties, whose bonds had been largely purchased, whose stocks had been secured and whose assets were to be bought in under foreclosure. It had an authorized capital stock of \$15,000,000, limited by its charter to \$20,000,000, and made two mortgages of \$8,000,000 each. Geo. Stephen was made first President of the company, R. B. Angus, Vice President, and I was chosen General Manager. This placed upon me the practical conduct of the enterprise from its formal inception.

The lines of the new system turned over to our possession on June 23, 1879, comprised 667 miles, of which 565 were completed and 102 under construction. From the beginning its business fulfilled the expectations of its founders. The annual report for 1880 showed an increase in earning of 54% and land sales amounting to \$1,200,000. And now began the long task of building up the country. No sooner was a mile of road finished than the need of building other miles became apparent. Before Minnesota had filled up, the tide of immigration was passing even the famous Red River Valley country and flowing into Dakota. By 1880 it had become necessary to add a line down the Dakota side of the Red River, to plan for many extensions and branches, and two local companies, building lines in western Minnesota, were purchased.

Only a detailed history of the railroad could follow step by step the progress of track extension and the financial arrangements by which capital was furnished for these constant and always growing demands from this time on. In a brief review such as this, I can call attention only to what may fairly be called points of historic interest in the growth of what is now the Great Northern System. One of these was the provision of an eastern outlet by way of the Great Lakes. An interest was obtained in the St. Paul & Duluth Rd. in 1881. This, with the building of the link from St. Cloud to Hinckley, gave the necessary access to the Great Lakes, until the organization of the Eastern Minnesota in 1887 as a subsidiary company furnished a permanent outlet and terminals. I was made Vice President of the company Nov. 1, 1881, and on Aug. 21, 1882, succeeded to the Presidency, a position whose duties I was to discharge for a quarter of a century. J. S. Kennedy, who had joined our party after the organization of the company, was elected Vice President. At no time have I accepted any salary for my services as President or Chairman of the Board of Directors, since I have felt that I was sufficiently compensated by the increase in the value of the property in which my interest has always been large.

Business now grew more and more rapidly, the Northern Pacific was about completed and the Canadian Pacific was building toward the Coast. The St. Paul & Pacific Rd. was originally, as its name implied, intended as a transcontinental line. The route to be traversed was rich in fertile soils and abundance of mineral and forest resources. Quite as important, perhaps, was the fact that it admitted of the construction of a line with grades so low and curves so moderate as to make possible cheaper overland carriage than had ever been previously considered. Montana was beginning a large development of her own; while the active growth of the North Pacific Coast, though only in embryo, could be foreseen. In 1887 the lines of the Manitoba were extended to a connection with the Montana Central. This latter company had been incorporated early in Jan., 1886. Realizing the importance of occupying a field in Montana which was essential to the future transcontinental line, valuable in itself and one which others were already preparing to secure, we had, with some friends, organized the company under the laws of Montana. Work was begun at once, the surveys being made in the coldest winter weather. Construction was rushed. The track was completed to Helena in 1887 and to Butte by the middle of 1888. A branch to Sand Coulee opened up the coal mines of that region, furnishing fuel for use on Montana and Dakota divisions of the line, and for the development of the mining interests in Montana which had been obliged up to that time to bring in their coal from Wyoming. The work of extending the Manitoba line to connect with the Mon-

tana Central launched this company upon the most active period of construction ever known in this country.

Five hundred continuous miles were graded between April and Sept., 1887, and by Nov. 18, 643 miles of track had been laid, an average rate of construction of $3\frac{1}{4}$ miles for each working day. But this activity on the main line to the west was only one item in the extension programme. Between 1882 and 1888 the stone arch bridge and terminals in Minneapolis were completed; the Dakota line down the Red River was finished to a connection with the Canadian Pacific; the Casselton branch was purchased; a line was built from Willmar to Sioux Falls, and afterward extended to Yankton; some railways in South Dakota were bought; the Montana Central was taken over at cost, and an elevator and large terminals at West Superior were arranged for. In 1889 the line to Duluth and West Superior was completed, giving terminals and dock accommodations which today are not surpassed anywhere in the country. The total mileage operated had now increased to 3,030 miles. The company had also begun to operate its own steamships, through the Northern Steamship Company, on the Great Lakes. These boats, which began to run in 1888 and 1889, not only afforded greater dispatch in the carriage of grain and flour from the head of the lakes to Buffalo and other lake ports, but they made the railway independent of other lake lines. It was thus enabled to protect its patrons, and to prevent its reductions in rates from being absorbed by increases made by the lines east of its lake terminals.

In 1889 the Great Northern Ry. Co. was organized, to bind into a compact whole the various properties that had grown too large for the charter limitations of the old Manitoba. It leased all the property of the latter company, and was prepared to finance the undertakings about to be completed or in contemplation. By 1893 the line was opened through to Puget Sound. In the next five or six years many improvements were made by relaying track with heavier rails and by changes in equipment and large additions thereto. Branches and feeders were built to round out the system. In 1897 a more direct line from the head of the lakes to the west was created by purchase and construction that completed a road across northern Minnesota to a connection with the main line. The taking over of the Seattle & Montana which, like the Montana Central, had been built by us to assure adequate terminals on the Pacific Coast and to enable construction to go forward from both ends of the line at once, extended the system from Seattle to Vancouver, British Columbia.

In 1901 the company decided to open negotiations for the joint purchase of the Chicago, Burlington & Quincy System by the Great Northern and the Northern Pacific. These were carried to a successful completion by the issue of joint collateral trust bonds to the amount of \$215,154,000, secured by the stock of the company acquired. Time has confirmed the wisdom of this act, by which through traffic arrangements have been simplified, and the public has gained much by the drawing together of markets and the quick and cheap distribution of products between Chicago, St. Louis and the Pacific Coast.

It was planned, through the formation of the Northern Securities Company, to form a holding concern for the control of these three great properties. The purpose was to prevent a dispersion of securities that might follow where large amounts were held by men well advanced in years, and so to secure the properties against speculative raids by interests at best not directly concerned in the progress of the country served by these lines. This was declared illegal, under the Sherman anti-trust law, by a divided court, upon suit by the United States govern-

ment, and the Northern Securities Company was dissolved.

In 1907 the subsidiary companies controlled by the Great Northern, including fourteen railway companies operated as a part of it, were purchased and incorporated into the Great Northern System, making of these related parts one homogeneous whole. In the same year I resigned the presidency of the system, and became Chairman of the Board of Directors,—the office that I lay down to-day. The work of extension and improvement has gone forward steadily. By the construction of the Spokane, Portland & Seattle line, along the north bank of the Columbia River, the Great Northern and the Northern Pacific obtained jointly entry over their own tracks into Portland. Lines are now being constructed through eastern Oregon that will open up a large and productive country. In 1909 the Burlington obtained control of the Colorado & Southern; so that the Great Northern covers, directly or over the tracks of allied lines, a territory reaching from Chicago, St. Paul, Minneapolis, Duluth and Superior on the east to Puget Sound and Portland on the west, and

from Galveston to Vancouver, British Columbia. The Great Northern System has grown from less than 400 miles of the original purchase to 7,407 miles.

Not lightly may the relation between a man and the work in which he has had a vital part be set aside. My personal interest in the Great Northern remains as keen as ever. The financial interest of myself and family in it is larger now than it ever was at any time in the past, and any change would more probably increase than diminish it. While I shall be no longer the responsible head of the Great Northern, I will contribute henceforth such counsel and advice as may seem best from one no longer holding the throttle valve or controlling the brake.

Most men who have really lived have had, in some shape, their great adventure. This railway is mine. I feel that a labor and a service so called into being, touching at so many points the lives of so many millions, with its ability to serve the country, and its firmly established credit and reputation, will be the best evidence of its permanent value and that it no longer depends upon the life or labor of any single individual.

Railway Track Labor.

By E. J. McVeigh, Storekeeper. Grand Trunk Railway, Ottawa.

When the man who handled track labor 20 years ago stops to consider, and compare, the conditions then existing with the conditions of today, and hopes for the future, he must feel that his day for doing things has gone by, never to return. Moreover, it is hard to teach old dogs new tricks, and many of the older roadmasters are really more pessimistic than they need be. In this matter we are, as in all other matters, in a state of evolution, and we must conform, or be left on one side, while younger men, men of the hour, carry on the work under the conditions they find, as the older men did in their day and generation. That conditions are different and more difficult is perfectly true, but conditions have changed in all lines of human effort. Life has become more strenuous all along the line, and where brawn fails us, we must use our brain to make life possible.

That we have done this is seen clearly on all sides, and nowhere more than in the construction and maintenance of railway permanent way. Our machinery for loading, unloading and spreading ballast and handling material shows this. In the portion of our country where the fall of snow is heavy we handled it by hand in the past when hands were many and willing; today we have other means to do it better with fewer hands, and it will be so to the end, which is not yet, and in the meantime we must live in the present and prepare for the future.

If we glance back over the railway history of this continent we will learn that when we wanted men for our track work they were recruited largely from the native stock, farmers' sons, the most intelligent and best trained labor the world has ever seen. In the early days of railway laboring, work off the farms was not so plentiful as it became later, so that these young men were more willing to take up track work. And they, with their natural intelligence and ambition, soon became expert in their work and proud of it. Many spent their lives at it, and it is from this number that our present day roadmasters and superintendents largely came.

But time flies, and as our country advanced and opened up, opportunity for this class of men increased, the railways did not fully realize the position, and did not increase wages fast enough to hold them. Whether they could in any case have held them in such a country as ours is a question, but the fact is they did not, so that today we are confronted with a fact and a condition. It is with the condition created by the fact that we must

deal, now and in the future. Go ahead we must, but we may, if we will, gather a few lessons from the past that may be of assistance in the future.

The questions have been asked, how do the railways now obtain labor, for, first, section gangs; second, extra gangs. The answer is that they obtain such labor in any way they can, and not fully recognizing the present condition of having to deal with ignorant foreign labor, few arrangements have been made, so far, to make and keep laborers satisfied and hold them. Another reason for this is that such labor is largely wanting, and no arrangements we have made will hold it for long.

It is indeed difficult to get a fair day's work out of our present track men. Even when they are willing to work hard, their ignorance and inability to understand what is said to them makes it next to impossible to get satisfactory results. Our only salvation is that we still have a few of the native stock left to lead and direct. The methods adopted to increase the amount of work accomplished will vary according to the men and conditions. There can be no rule laid down in such a matter, and I have yet to see a failure through treating men considerately. One man may do considerable driving and accomplish much without losing his men or having them go sour on him, while another may do just the reverse. But one thing we can never afford to neglect is the square deal. Man from infancy resents injustice. It may be true that in the older countries men have been forced to accept a greater measure of injustice than do men on this continent, but even then they resented it, though unable to make their resentment felt. In this country, with a choice of where and for whom they shall work, they can, and do, make their resentment effective. So that even if on no higher grounds than that of expediency, let us be fair and do justice only, in our dealings with our laborers. Not only do this personally, but see to it so far as in us lies that others do the same. The fact that many of these men will not make a fair return for fair treatment does not lessen our obligation in the matter. You owe it to yourself if not to your men, but you do owe it to them; and besides it pays, believe me, it pays well. You may not see it at once, not today nor tomorrow but our railways are not here for today nor tomorrow only, and a reputation for fair treatment or dealing is a never failing source of strength to the railway company as well as to the individual. We have all seen

or heard of trouble, with foreign labor; do not be too hasty in condemning the men in such cases. In the light of my own experience I would accept no man's word as to where the fault lies until I had heard both sides. Our railway executive are always desirous of dealing fairly with their men, but there are many heads and hands between the executive and the man with the shovel—the contractor with his “drivers,” storekeepers and timekeepers; the roadmasters with their assistants. How can our executive officers be sure that these men in excess of zeal, or greed, have not gone beyond what is fair and just? And when trouble comes it is their side of the case that is heard, and the blame put on the men.

There are several causes that lead to trouble with foreign labor. One of these is, of course, the natural foolishness of the human animal, and that is not confined to any breed or nation. The other might be shortly expressed as unfair treatment; to divide this into its several phases it would read, poor food and sleeping quarters, excessive charges for supplies, “shaving” of time, brutal treatment by foremen and indifference on the part of higher officers.

Shortly after I had become interested in this matter I had an experience that was amusing and enlightening at the same time. I had given a certain man a contract to cut and pile on the right of way some thousands of cords of hard wood. He could not secure good woodsmen and picked up a gang of Italians to do the work. As we required the wood for steamboat firing, the roughness of the work was of no consequence, so we let him go ahead. When they had got a fair amount cut and piled I dropped off a train and measured it up for a 30 day estimate. I did not see any of the men at this time, but it was necessary that the wood I had measured should be marked to prevent confusion, and I left a stamp hammer at the station with instructions for the section foreman to go up next morning and stamp the piles. About noon the following day I received a telegram from the foreman to the effect that he had attempted to stamp the wood, but he Italians had swarmed out of the bush and chased him two miles, and would have certainly killed him had he not been a good runner.

I wired him to meet me the next morning, and when I stepped off the train he asked me how many soldiers I had brought with me. I told him I had no soldiers, but he and I would go up and stamp the wood. He offered me the hammer and promised to pick up as many pieces of me as he could find after the gang had got through playing with me; but to go back there with one man, and he only five foot seven, he would not. He was a big Scotchman, and we had considerable of an argument, but when I told him I would offer myself as a sacrifice and give him a chance to make another run, he came along.

The roadway used by the teams bringing out the wood was west of the wood piles, and the piles stretched a quarter of a mile east in the direction of the station. I took my stand on the track opposite the roadway, while Sandy got ready either to work or run, at the east end of the longest pile. I signalled him to go ahead, and the sound of the hammer on the beech wood echoed through the forest. Wow! He had not struck six blows when hell broke out for noon, back in the cutting, and out came the Italians. One fellow had a gun, some had knives, others brought their chopping axes, and one chap had a long crosscut saw that kept catching in the brush and throwing him down, but he held on to it as his only hope. I have often listened to a pack of wolves, but that crowd could give the largest pack I ever heard cards and spades and then win in a walk. It was funny to me because I knew, but it was not funny to Sandy. I glanced at him,

and he stood in the centre of the track ready to light out for home and safety. Then the gang poured out through the opening in the fence.

But alas, what a come down! They saw me standing there laughing at them, and recognized in me the authority, so instead of murder and sudden death, there were abject apologies and attempts at explanation. But I needed none. I was the one in fault; they did not understand, and I did. I had no right to send a strange man there to stamp their wood without explaining to them. This may not seem to have a bearing on the question we are considering, but I think it has. We must make up our minds that in future we must expect to do the greater part of our track work with foreign labor. Personally I favor the Swede, and the Italian from the north of Italy. But we must do something to keep these men with us. To begin with, we should go systematically to work to secure the men we want for our sections from the better class of the people I have named, and do it now while we have a few of the native stock left to train them. Then we should help and encourage them to make homes for themselves. Keep our section force down to a reasonable number and make that number permanent. The constant change in number and personnel of our section force has a demoralizing effect. Place on the shoulders of our small permanent force the full responsibility for general maintenance, but send an extra gang over each section in the spring to put in ties and line track. If new ballast is put out, have this gang attend to it also. Rush this class of work through to a finish, and then lay off the extra gang.

Railway men everywhere are considering this very important matter carefully, and I am of the opinion that the plan I have tried to outline above is the real solution of the problem. We have been trying to go ahead in a catch as catch can manner, conditions beoming worse each year. It is time we adopted a system and followed it. Our section forces are discouraged and demoralized. If a crew manages to get ahead with the work they are taken off their section to help the fellow who, for some reason is behind. We allow an extra man, or two, if we can get them, to help with the ties. Even then it takes all summer to get a reasonable number under the track, while all other work must be neglected. The small section force can no longer line the heavy track, and crews must be doubled up for that purpose. These things are all bad, and we should get away from them.

It will be claimed that these changes will cost more money than the railway can afford to pay. But we must first remember that the work must be done whether we can afford it or not. And then I am not sure that it would cost more than now. Suppose we have been in the habit of putting two men on each section of a district of 25 sections to help out during April, May, June and July, and it takes the crews so strengthened all of this time to get in the ties, and then they cannot line or do any other work. Now make up two extra gangs of 25 men to do nothing but put in ties and line. Would not they do the whole district in less than four months, while all other work should be kept up-to-date by the regular section crew, who would neither be increased in the spring nor decreased in the fall?

We must secure permanence and contentment in our section force. It is not good policy to reward a man and crew for extra effort by taking him off his section to help some other fellow.—Railway Engineering and Maintenance of Way.

The Algoma Central and Hudson Bay Navigation Co.'s steamboat Leafield went ashore, Aug. 17, near Bagster's lighthouse, Georgian Bay,

Mainly About Transportation People.

MRS. ROBERT PATTERSON, wife of the Master Mechanic, G.T.R., Stratford, Ont., died July 26.

P. SMITH, chief clerk to the Auditor of Passenger Receipts, G.T.R., died in the Homeopathic Hospital, Montreal, Aug. 7.

Mrs. Pariseau, wife of L. S. PARI-SEAU, of the Department of Railways engineering staff, died at Montreal, July 28.

E. A. McGUINNESS, C.P.R. station ticket agent, Brandon, Man., was married at Souris, Man., Aug. 7, to Miss E. G. Dolmage.

B. B. KELLIHER, Chief Engineer, G.T. Pacific Ry., Winnipeg, left Vancouver, Aug. 6, for a holiday trip to the United States.

F. McKINNON, baggage master, Intercolonial Ry., at Norton, N.B., was run over and killed by a train in the yard, Aug. 10.

W. F. RYAN was presented with a case of cutlery, July 27, by the C.P.R. telegraph's staff at Montreal, on leaving the service.

G. U. RYLEY, Land Commissioner, Grand Trunk Pacific Ry., Winnipeg, is convalescing after an operation for appendicitis.

Mrs. Leonard, mother of R. W. LEONARD, Commissioner, National Transcontinental Ry., died at Brantford, Ont., July 27, aged 87.

T. HORNER, General Roadmaster, Northern Division G.T.R., Allandale, Ont., left, July 29, for a six weeks' trip to the Pacific coast.

R. H. SPERLING, General Manager, British Columbia Electric Ry., and Mrs. Sperling left Vancouver, Aug. 8, for London, Eng., on a lengthened trip.

A. F. WEBSTER, steamship ticket agent, Toronto, is one of the provisional directors of the Union Brick Co., which has just been incorporated there.

H. B. SAMPLE, Terminal Agent, Intercolonial Ry., Bonaventure station, Montreal, for the past 13 years, died there, Aug. 9, after a lengthened illness.

A. A. Andrews, of Winnipeg, Man., who died in St. Luke's Hospital, Chicago, Ill., Aug. 2, was father of P. C. ANDREWS, of Mackenzie, Mann and Co.'s office.

Sir HENRY M. PELLATT, director, Toronto Ry., Toronto, has been appointed by the King to be a Knight of Grace of the Order of the Hospital of St. John of Jerusalem.

LORD STRATHCONA celebrated his ninety-second birthday, Aug. 7. He is enjoying good health, having apparently completely recovered from his recent indisposition.

A. PRICE, General Superintendent, Alberta Division, C.P.R., Calgary, returned to duty, Aug. 15, after spending a month's vacation in the Columbia valley and on the Pacific coast.

MISS B. M. BRADY, daughter of F. P. Brady, General Superintendent, Canadian Government Railways, was married at Moncton, N.B., Aug. 14, to E. H. Parmelee, of North Bay, Ont.

D. SIMPSON, who had been in the employ of the G.T.R. for 50 years, for 41 of which he has been a locomotive driver running out of Montreal west, retired from active service, July 31.

SIR WILLIAM MACKENZIE returned to Toronto from England, Aug. 1, accompanied by M. NORDEGG, one of the directors of Brazeau Collieries Ltd., with which Sir William is associated.

T. P. SHONTS, President, Toledo, St. Louis and Western Rd., New York, it is reported, will resign shortly, so that he may devote more time to the work of the Interborough Rapid Transit Co.

J. W. FARRELL, Trainmaster, Dis-

tricts 1 and 2, Eastern Division, G.T.R., Island Pond, Vt., who was recently granted extended leave of absence, on account of ill health, has resumed duty, as Trainmaster, District 2.

A. BUTZE, formerly General Purchasing Agent, Grand Trunk and Grand Trunk Pacific Railways, has been appointed Assistant Secretary and Purchasing Agent, National Steel Car Co., which is building a plant at Hamilton, Ont.

G. H. HAM, Chief of the Publicity Department, C.P.R., Montreal, was recently presented with a gold cigarette case, suitably engraved, by a number of British manufacturers, on the completion of a tour through the Dominion.

MISS FLORENCE MILLS BERTRAM, only daughter of Alex. Bertram, of John Bertram & Sons Co. Ltd., Dundas, Ont., is to be married early in the autumn to F. J. Sharp, son of the Rev. J. Sharp, of Bridgewater, N.S.

MRS. W. E. DUPEROW, wife of the General Agent, Passenger Department, G.T. Pacific Ry., Vancouver, has been visiting relatives and friends in Toronto

P296 R. Armstrong,
Superintendent, District 3, Saskatchewan
Division, Canadian Pacific Ry., Saskatoon.

and Stratford, Ont., after an absence of over three years.

HUGH McDONALD, Freight Claims Agent, Canadian Northern Quebec Ry., and Quebec and Lake St. John Ry., Quebec, was married, Aug. 6, to Miss B. Neville, after which they left for a trip to New York and New Jersey.

J. W. LEONARD, Assistant to Vice President McNicoll, C.P.R., and M. N. TODD, President, Galt, Preston and Hespeler St. Ry., sailed from Montreal, Aug. 17, on the s.s. Lake Manitoba, intending to return about the middle of October.

W. C. BROWN, President, New York Central and Hudson River Rd., left Spokane, Wash., for Alaska, Aug. 9, and on returning will land at Vancouver, whence he will return to New York via the C.P.R., spending some time in the Rocky Mountains.

C. H. RUST, M. Can. Soc. C.E., City Engineer, Victoria, B.C., and formerly City Engineer, Toronto, has been elected First Vice President, American Society of

Civil Engineers. He was President, Canadian Society of Civil Engineers for the year 1911-12.

N. L. RAND, who died at Moncton, N.B., Aug. 5, entered the European and North American Ry. service in 1859, and finally retired from railway work in 1909, at which time he was Master Mechanic, Intercolonial Ry., with jurisdiction east of Campbellton, N.B.

F. W. MORSE, formerly Vice President and General Manager, Grand Trunk Pacific Ry., has resigned the position of Vice President and General Manager, Chicago and Alton Rd., Chicago, Ill., and the duties have been assumed by the President, B. A. Worthington.

R. J. WICKSTEED, LL.D., barrister, Ottawa, who died there recently, left his estate, valued at over \$58,000, to McGill University, Montreal. He was a brother of H. K. Wicksteed, M. Can. Soc. C. E., Chief Engineer of Location, Mackenzie, Mann and Co., Ltd., Toronto.

P. McQUAID, whose appointment as Master Mechanic, Prince Edward Island Ry., Charlottetown, P.E.I., was announced in a recent issue, entered P.E.I. Ry. service, Apr. 16, 1888, as machinist, and was appointed Roundhouse Foreman, Jan. 1, 1905, and Master Mechanic, June 1, 1912.

W. O. HOUSTON, who has been appointed Division Engineer, Michigan Central Rd., St. Thomas, Ont., is a graduate of the University of Michigan. He was at one time Chief Engineer, New Orleans Great Northern Rd., and has been, for the past year, an assistant engineer, M.C.R.

W. E. HAYWARD, whose appointment as Locomotive Foreman, C.P.R., North Bend, B.C., was announced in our last issue, entered C.P.R. service, June 20, 1911, since when he has been, to June 26, 1912, machinist at Revelstoke, B.C.; June 26 to July 1, 1912, Shop Foreman at Kamloops, B.C.

Mrs. Scott, who died at SIR WILLIAM WHYTE'S house, Winnipeg, Aug. 18, aged 96, was the mother of Lady Whyte. Her late husband, Adam Scott, was engaged in railway work in Toronto several years ago, and was killed on the old Northern Ry. Her son, B. W. Scott, is Freight Agent, G.T.R., Montreal.

W. D. WASHBURN, who died at Minneapolis, Minn., July 29, was, from 1861 to 1865, Surveyor General of Minnesota, and was the promoter, and for many years President of the Minneapolis and St. Louis Rd., and the Minneapolis, St. Paul and Sault Ste. Marie Ry., the latter now being controlled by the C.P.R.

H. McEWEN, whose appointment as Superintendent, Prince Edward Island Ry., Charlottetown, P.E.I., was announced in a recent issue, entered P.E.I. Ry. service, May 14, 1875, as station master at Mount Stewart, and was appointed dispatcher, Feb., 1892; Chief Dispatcher, May 1899, and Superintendent, May 1, 1912.

A. W. SMITHERS, Chairman of the Board, G.T.R., arrived in Canada, from England, Aug. 4, accompanied by his son and daughter. E. J. Chamberlin, President, G.T.R., and G. T. Pacific Ry., joined the party at Montreal, which left for a tour of the G.T.R. to Chicago, whence they proceed to Winnipeg to go over the G. T. P. Ry.

W. PHILLIPS, European Traffic Manager, Canadian Northern Ry., who has been busily engaged since his arrival in England recently, in reorganizing the department, is about to make a tour of the European agencies, accompanied by a representative of P. A. Van Es & Co., of Rotterdam, the company's General Agents on the continent.

J. M. BANNERMAN, who recently resigned from the Canadian Northern Ry. freight department, Winnipeg, on his ap-

pointment as station master, Fort Garry union station, which latter position he also resigned to become inspector, Canadian Northern Transfer Co., Winnipeg, was, on July 23, presented with a suite of furniture by the C.N.R. freight department staff.

Miss H. M. Bury, eldest daughter of GEORGE BURY, Vice President and General Manager, Western Lines, C.P.R., was married at Winnipeg, Aug. 17, to H. R. Drummond-Hay. The bride and bridegroom travelled to Montreal in the C.P.R. private car Manitoba, and sailed, Aug. 21, on the s.s. Royal George to spend about two months in Europe. They will live in Winnipeg.

S. P. PORTER, who is reported to have been appointed Executive Agent, Grand Trunk Pacific Ry., Regina, Sask., was born in Somersetshire, Eng., in 1870, and came to Canada in 1886. He was engaged in farming for a few years, and entered railway service in 1889 as trainman on the C.P.R. He was appointed homestead inspector for the Dominion Government in 1901, and in 1908 was appointed Deputy Minister of Railways, Telegraphs and Telephones for Saskatchewan.

SIR MAURICE FITZMAURICE, M., Inst. C. E., M. Can. Soc. C. E., recently resigned the position of Chief Engineer of the London County Council, Eng., to take up private practice. He was a member of the first board of engineers appointed by the Dominion Government in connection with the designing of the Quebec bridge, now under construction. One of the U. S. technical papers states that he was knighted by King George IV., who has been dead for something over 80 years.

F. H. McGUIGAN, formerly Fourth Vice President, G.T.R., and later Vice President, Great Northern Ry. (U.S.), but who has for several years carried on a general engineering and contracting business in Toronto and Montreal, was reported to be in a serious condition of health, Aug. 13, when the Montreal board of control intimated that he was compelled to abandon his contract for the construction of a filtration plant. He suffered a breakdown in July, and has been advised to take a complete rest for some time.

FOLEY BROS. & LARSEN, railway contractors, for many years carried on an extensive provision and supply business, mainly for the purpose of supplying railway construction camps. Some years ago the Winnipeg business was closed out, and it was reported, Aug. 12, that the Edmonton business had been sold. The firm originally consisted of the Foley Brothers; subsequently it was Foley Bros. and Larsen, and at a more recent date P. Welch and J. W. Stewart became associated with it, and the firm name is now Foley, Welch and Stewart.

G. C. RANSOM, who has been appointed Chairman Canadian Freight Association Eastern Lines, was born at Victor, N.Y., August 20, 1864, and entered transportation service in 1887, his record being: June, 1887 to October, 1898, with the Blue Line, Rochester, N. Y.; October, 1898 to October, 1899, New York Central Lines, Buffalo, N. Y.; October, 1899 to April, 1906, at Montreal, Chief Clerk, General Freight Department, Michigan Central Road, Detroit, Mich.; April, 1906 to January 31, 1907, Chief Clerk, same department; February 1, 1907 to August 15, 1912, District Freight Agent, New York Central Lines, Buffalo, N. Y.

O. MASSE, whose appointment as acting Chief Dispatcher, districts 4 and 5, eastern division, G.T.R., Montreal, was announced in our last issue, was born at Coteau Jct., Que., Nov. 6, 1884, and entered G.T.R. service Nov. 1, 1901, since when he has been, to Feb. 25, 1903, night freight clerk; Feb. 25, to Dec. 2, 1903, night operator; Dec. 2, 1903, to June 21, 1904, day operator; June 21, 1904 to May

30, 1905, day operator and supervisor of crews; May 30 to Oct. 15, 1905, operator in dispatchers' office; Oct. 15, 1905, to Oct. 14, 1911, dispatcher in various districts; Oct. 14, 1911, to July 1, 1912, Night Chief Dispatcher, Montreal.

J. V. DILLABOUGH, who is reported to have been appointed office engineer on the Dominion Government railway to Hudson Bay, commenced his railway work in 1905, as Resident Engineer, District D, National Transcontinental Ry., being transferred to District F, with headquarters at St. Boniface, Man., in 1907. While there, the chief works with which he was connected were the design and layout of the Transcona shops and yards, and the construction of the double track bascule bridge over the Red River, carrying the track to the Fort Garry station. He was transferred to office engineer, District F, Dec. 1911.

R. R. NEILD, who recently resigned the position of General Locomotive Foreman, C.P.R., Winnipeg, on his appointment as General Superintendent, Manitoba Bridge and Iron Works, there, entered C.P.R. service in 1900, and has held the positions of Foreman, machine shop, General Foreman, erecting shop, and was the first official to take charge of the locomotive department of the Angus shops, Montreal, supervised the organization there previous to the removal of the staff from the old plant on Delorimier Ave., and started the piece work system. He was appointed General Locomotive Foreman at Winnipeg, Feb. 1908.

ERNEST ALEXANDER, who has been appointed Assistant Secretary, C.P.R., was born in Yorkshire, Eng., Dec. 8, 1862, and commenced railway work in 1882, as private secretary to the Superintendent, Southern Division, G.T.R., Hamilton, Ont., remaining in that position until the abolition of the company's general offices there, early in 1893. On Mar. 1, 1893, he entered C.P.R. service as secretary to the President, Sir William Van Horne, and on Sir William's retirement from the presidency in 1899, he remained in the same capacity with Sir Thomas Shaughnessy, until July 1908, when he was appointed Assistant Treasurer, C.P.R., Montreal.

J. H. BROOKS, who has been appointed District Master Mechanic, District 2, Lake Superior Division, C.P.R., White River, Ont., was born in Lancashire, Eng., Aug. 6, 1867, and commenced railway work there, as fireman on the London and North Western Ry. He came to Canada in 1884, and entered C.P.R. service as stationary fireman in the car shops at Perth, Ont., remaining there until 1885, when he left railway service, returning to C.P.R. service Oct. 1887, since when he has been, to Feb. 1888, fireman at Schreiber, Ont.; Feb. 1888 to 1900, fireman at North Bay, Ont.; 1900 to Oct. 1911, locomotive driver, North Bay, Ont.; Oct. 1911 to July 1, 1912, acting District Master Mechanic, North Bay, Ont.

J. H. JOHNSTON, whose appointment as Master of Bridges and Buildings, Eastern Division, G.T.R., Montreal, was mentioned in our last issue, was born at Uxbridge, Ont., Apr. 22, 1866, and entered railway service, Oct., 1886, since when he has been, to Aug., 1898, in various positions in the engineering department, Midland Ry., now part of the G.T.R.; Aug., 1898, to Nov., 1903, Building Foreman, Northern Division, G.T.R.; Nov., 1903, to Sept. 1904, Building Inspector, Northern Division, G.T.R.; Sept., 1904, to Aug., 1905, Building Inspector, Middle Division, G.T.R.; Aug., 1905, to Jan., 1906, General Foreman, Middle Division, G.T.R., London, Ont.; Jan., 1906, to July, 1912, Master of Bridges and Buildings, Ottawa Division, G.T.R.

J. A. GLASFORD, whose appointment as Terminals Manager, Winnipeg Joint Terminals, was announced in a recent issue, and whose portrait appeared in our last issue, was born at Cardinal, Ont.,

Apr. 27, 1863. He commenced railway work 25 years ago as telegraph operator, G.T.R., Montreal, and his record covers the positions of chief clerk to General Superintendent, Detroit, Mich.; General Yardmaster, Montreal; Trainmaster, Queen and Crescent Route, Chattanooga, Tenn.; Construction Superintendent, Norfolk and Southern Ry., Virginia; Superintendent, Northern Division, same road; in charge of handling freight and passenger traffic, C.P.R., Winnipeg; and, until the date of his present appointment, in a similar position at Toronto.

SIR PERCY GIROUARD, who recently resigned the position as Governor-General and Commander-in-Chief of the British East Africa Protectorate, to join the firm of Armstrong, Whitworth and Co., of Elswick and Manchester, Eng., was engaged on early construction work on the C.P.R., but since 1888 has been connected with military service with the Royal Engineers, during which time he organized the railway system at Woolwich Arsenal, Eng., and has been director of Sudan Railways; President, Egyptian Railway Board; Director of Railways in South Africa, during the early period of the war, and in the later stages, Commissioner of Railways for the Transvaal and the Orange River colony. He was born in Montreal in 1867, and is a son of the late Justice Girouard of the Supreme Court of Canada.

J. G. RUTHERFORD, V.S., who has been appointed Superintendent of Animal Husbandry, Department of Natural Resources, C.P.R., Calgary, Alta., was born at Mountain Bank, Peeblesshire, Scotland, Dec. 25, 1857, and was educated at the Glasgow High School, Ontario Agricultural College, and Ontario Veterinary College, receiving his degree with gold medal in 1879. He was elected an honorary associate of the Royal College of Veterinary Surgeons in 1908, and was in practice for several years in Canada, the United States and Mexico. He served during the North-West rebellion in 1885, receiving the medal and clasp, and has held many Provincial and Dominion appointments in a professional capacity, his last position being Chief Veterinarian for the Dominion. He was appointed a Commander of the Order of St. Michael and St. George in 1910.

F. E. WARD, who recently announced that he would, on Sept. 1, resign the position of General Manager, Chicago, Burlington and Quincy Rd. lines east of Missouri River, Chicago, Ill., was born July 29, 1867, and educated at McGill Model School, Montreal. He entered railway service Sept. 1881, since when he has been, to Nov. 1885, consecutively, apprentice, clerk and stenographer, G.T.R. Mechanical Department, Montreal; Jan. 1886 to Dec. 1887, secretary to Second Vice President, St. Paul, Minneapolis and Manitoba Ry., St. Paul, Minn.; Jan. 1888 to Nov. 1890, secretary and chief clerk to President and General Manager, Eastern Ry. of Minnesota; Jan. 1891 to July 1894, secretary to President, Great Northern Ry.; July 1894 to Feb. 1898, Assistant to President, same road; Mar. to Oct. 1898, General Superintendent, Montana Central Ry.; and subsequently General Superintendent, Great Northern Ry., St. Paul, Minn.

J. A. HEAMAN, who has been appointed Assistant to Chief Engineer, Grand Trunk Pacific Ry., Winnipeg, was born at Memphis, Tenn., June 3, 1874, and educated in the public schools and the Collegiate Institute, London, Ont., and McGill University, Montreal. He entered railway service, Apr. 1901, since when he has been, to Apr. 1902, instrumentman, G.T.R. double track construction; Apr. to Nov., 1902, Resident Engineer on construction, G.T.R.; Nov. 1902 to Nov. 1903, Resident Engineer on maintenance, G.T.R.; Nov. 1903 to May 1905, Assistant Engineer, G.T. Pacific Ry. location, east of Winnipeg; May 1905 to Nov. 1907, Assistant Engineer in charge of location and

construction, National Transcontinental Ry.; Nov. 1907 to Oct. 1908, Assistant District Engineer, National Transcontinental Ry.; Oct. 1908 to June 1910, Assistant District Engineer, G.T. Pacific Ry.; June 1910 to Apr. 1911, District Engineer, G.T. Pacific Ry.; Apr. 1911 to Apr. 1912, Office Engineer, G.T. Pacific Ry.; Apr. to Aug. 1, 1912, Division Engineer, G.T. Pacific Ry., Fitzhugh, Alta.

W. C. LANCASTER, who was recently appointed Electrical and Mechanical Engineer, Montreal Tunnel and Terminal Construction, Mackenzie, Mann and Co., is a member of the American Institute of Electrical Engineers, and also of the American Society of Mechanical Engineers, and took degrees in both of these branches of engineering at the Virginia University. His record covers the following positions:—Electrical engineer for a large street railway in the south, in charge of the electrical and mechanical work on the construction of the Pennsylvania Rd., Manhattan crosstown tunnels, and electrical and mechanical engineer of the following works:—Five-mile section of the Catskill aqueduct tunnel in New York City, part of the Erie barge canal near Lockport, N.Y., electric pumping and water works for Long Beach, electric pumping plant for Long Island Rd., a tunnel and water power development at Shelburne Falls, Mass., and the design of the electric power plant and sewage pumping station at Havana, Cuba. He also made the tests of the first New York Central Rd. electric locomotive.

G. C. MARTIN, whose appointment as General Freight and Passenger Agent, Toronto, Hamilton and Buffalo Ry., Hamilton, Ont., was announced in our last issue, was born at Creemore, Ont., Jan. 2, 1866, and commenced his railway career as assistant to agents, Northern and North Western Ry., at Creemore, New Lowell and Thornbury, Ont. He was engaged as an operator on construction, C.P.R., near Calgary, Alta., and at Hawke Lake, Ont., in 1883, and was appointed agent and operator, Northern and North Western Ry., Colwell Jct., Ont., in 1884, was moved to Caledon East, Ont., in 1886, to Cardwell Jct., Ont., in 1888, and to the city ticket office, London, Ont., in 1889. He entered C.P.R. service in 1891 as relieving agent, and after a varied experience in station work, station auditing, dispatching, etc., for several years, he left railway service for one year, returning to the service as clerk in the G.T.R. ticket office, union station, Toronto, and in 1897 was appointed chief clerk in the General Freight and Passenger Department, Toronto, Hamilton and Buffalo Ry., Hamilton, Ont., being promoted to Assistant General Freight and Passenger Agent, same road, Oct. 1909, which position he held to July 22, 1912, the date of his present appointment.

R. ARMSTRONG, who has been appointed Superintendent, District 3, Saskatchewan Division, C.P.R., Saskatoon, and whose portrait appears in this issue, was born at Kingston, Ont., Jan. 27, 1865, and commenced railway work, May 1886, since when he has been, to June 1894, operator, Kingston and Pembroke Ry.; June 1894 to 1896, in private business; June 9 to July 1896, operator C.P.R.; Weyburn, Sask.; July to Dec. 1, 1896, operator, C.P.R., Revelstoke, B.C.; Dec. 1, 1896, to Oct. 1900, agent, C.P.R., Illecillewaet, B.C.; Oct. 1900 to Oct. 1901, dispatcher, C.P.R., Nelson, B.C.; Oct. 1901 to Apr. 1902, relieving agent, Nelson and Vancouver districts, C.P.R.; Apr. 1902 to Sept. 1906, yard agent, C.P.R., Vancouver, B.C.; Sept. 1906 to Aug. 1907, agent, C.P.R., Vancouver wharf; Aug. 1907 to May 1908, agent, C.P.R., Vancouver, B.C.; May 1908 to Jan. 1910, General Agent, C.P.R., Fort William, Ont.; Jan. 1910 to July 1912, Superintendent Fort William Terminals, C.P.R. On leaving Fort William recently, he was presented with a gold chain and locket, and a silver tea

set and casket of silver for Mrs. Armstrong, by the local staff, and an address, a cut glass set, two chairs and a travelling bag, by members of the board of trade and the city council.

W. G. BROWNLEE, who has resigned the position of General Transportation Manager, G. T. R., Montreal, was born at Lawrenceville, Ill., September 9, 1858, and entered railway service in 1877, since when he has been, to 1879, operator, Ohio Mississippi Ry.; 1879 to 1881, operator and train dispatcher, Union Pacific Ry.; 1881 to 1884, train dispatcher and trainmaster, Denver and Rio Grande Road; 1884 to 1887, train dispatcher, Union Pacific Road, Laramie, Wyo.; 1887 to 1889, train dispatcher, same road, St. Louis, Mo.; 1892 to February, 1900, Division Superintendent, same road, St. Louis, Mo.; February, 1900 to May, 1901, Assistant Superintendent, Eastern Division, G. T. R., Belleville, Ont.; June, 1901 to March, 1902, Superintendent, Eastern Division, same road, Montreal; March, 1902 to December, 1904, Superintendent, Western Division, same road, Detroit, Mich.; January, 1905 to April, 1907, Superintendent, Middle Division, same road, Toronto; April 1907 to August 16, 1912, General Transportation Manager, same road, Montreal. In an interview after his resignation had been announced, he is reported to have said: "I have been 36 years in railway service and have never been a day off the pay roll in that time. For the last two and a half years I have not had a holiday and in that time I have travelled in the course of my duties, at the rate of over 70,000 miles a year. I have now come to the conclusion not only that I want a rest, but that it is time I enjoyed some of the pleasures of life. I intend to go down to my summer cottage on Peaks Island, Casco Bay, until October 1, when I shall probably go abroad for four or five months. Beyond that I have no plans so far."

The Great North Western Telegraph Co., in order properly to take care of its rapidly increasing business, has recently completed a number of improvements in its larger offices. In the Toronto office there has been installed an up to date plant, the large main line switch which accommodates all the trunk lines having been moved, and the wires placed in a new, all steel frame, which also contains marble panels for table connection jacks. Special features of the new work include: steel switch board frame, new combined transfer protector, terminal rack and repeater tables. The multiplex apparatus has been placed on repeater tables near the switch board, and the operators placed on extended locals. This greatly facilitates the wire chiefs' work. The operating tables have been equipped with new style resonators and improved message clips. These changes have been made under the direction of C. E. Davies, Supervisor of Equipment, and J. Murdock, Electrician. The company is also making further improvements in its equipment at Montreal, Quebec, Ottawa, Hamilton, Ont., Campbellton, N.B., and Winnipeg, which when completed will add considerably to its present facilities.

The Fort George and Alberta Telephone and Electric Co. has erected a telegraph line connecting Fort George with the Government Yukon telegraph line at Blackwater, and it is said that arrangements are being made with the Government by which the company will cut in straight to Ashcroft and thence to Vancouver, thus obviating the necessity for relaying messages to the coast.

The Roadmasters and Maintenance of Way Convention will be held at Buffalo, N.Y., Sept. 10-13. Among those named to speak at the dinner on Sept. 12 is M. S. Blaiklock, Engineer Maintenance of Way, G.T.R., Montreal.

Honor Bestowed on T. C. Keefer.

T. C. Keefer, past President of both the Canadian and American Societies of Civil Engineers, and one of the oldest and best known engineers in America, has been elected an honorary member of the Institution of Civil Engineers of Great Britain, in recognition of the distinguished part he has taken in the engineering enterprises which have aided so largely the development and prosperity of Canada, and on account of the services he has rendered to the engineering profession during his long association with it. He will be 91 years old on Nov. 4. He began his engineering career in 1838 on the Erie canal. Later he was Division Engineer in the building of the Welland canal. In 1845 he was Chief Engineer of the Ottawa River improvement work. Six years later he made preliminary surveys for the G.T.R., and his influence was largely responsible for the abandonment of the broad gauge. He was engineer for the design and construction of the waterworks of Montreal, Hamilton and Ottawa, and was prominent in the inception and ultimate construction of the C.P.R. He was the first President of the Canadian Society of Civil Engineers in 1887, and served again in that office in 1897. He is a Companion of the Order of St. Michael and St. George, an officer of the French Legion of Honor, and has been the recipient of many other honors.

The Commissioners of the Transcontinental Railway.

NOTICE TO CONTRACTORS

Tenders for Piping Systems, Pipe Tunnels, Pipe Coverings and Wiring Ducts.

Sealed Tenders, addressed to the undersigned, and marked on the envelope, "Tenders for Piping Systems, Pipe Tunnels, Pipe Coverings, and Wiring Ducts," will be received at the Office of the Commissioners of the Transcontinental Railway, at Ottawa, Ontario, until 12 o'clock noon, of the 16th day of September, 1912, for furnishing and installing all Piping Systems, Pipe Tunnels, Pipe Coverings, and Wiring Ducts required in connection with the Car Shop Plant of the Winnipeg Shops, situated in Section 5, Township 11, Range 4-E, on the line of the National Transcontinental Railway, about six miles East of Winnipeg, Manitoba.

Plans may be seen and specifications and forms of tender obtained at the office of Mr. W. J. Press, Mechanical Engineer, Ottawa, Ont., and at the office of Mr. H. H. Pinch, Assistant Engineer, Transcona, Manitoba.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied by the Commissioners.

Each tender must be signed and sealed by all the parties to the tender, and witnessed, and be accompanied by an accepted cheque on a Chartered Bank of the Dominion of Canada, payable to the order of the Commissioners of the Transcontinental Railway, for a sum equal to ten per cent. (10 p.c.) of the amount of the tender.

The cheque deposited by the party whose tender is accepted will be deposited to the credit of the Receiver-General of Canada, as security for the due and faithful performance of the Contract according to its terms. Cheques deposited by parties whose tenders are rejected, will be returned within ten days after the signing of the contract.

The right is reserved to reject any or all tenders.

By order,

P. E. RYAN,

Secretary.

Dated at Ottawa, August 22nd, 1912.

Newspapers inserting this advertisement without authority from the Commissioners, will not be paid for it.—27510.

Transportation Appointments Throughout Canada.

The information under this head, which is almost entirely gathered from official sources, is compiled with the greatest care, so as to ensure absolute accuracy. Anyone who may notice an error in our announcements will confer a favor by advising us.

Canadian Northern Ry.—P. A. Van Es & Co., Rotterdam, Holland, who are the General Agents on the European continent for the Canadian Northern Ry., except in Patras, Greece, have appointed the following agents:—

Antwerp—John P. Best & Co.
Bremen—Carl Prior.
Paris and Havre—Caplain, Cahen & Strauss.
Barcelona and Valencia—McAndrews & Co.
Alicante—Carey & Co
Stockholm—Aktiebolaget Nyman & Schultze.

Gothenburg—C. W. Lindegren.
Christiana—Th. Mortensen.

Canadian Pacific Ry.—ERNEST ALEXANDER, heretofore Assistant Treasurer, has been appointed Assistant Secretary, vice A. R. G. Heward, deceased. There are two Assistant Secretaries, H. Campbell Oswald being the other. Office, Montreal.

M. J. POWER, heretofore secretary to the President, has been appointed General Storekeeper for Lines East of Fort William, Ont., vice J. H. Callaghan, deceased. Office, Montreal.

F. E. DEWEY has been appointed Assistant Inspector of Transportation, Eastern Lines, vice J. B. Smith, who is acting as Assistant Superintendent, Montreal Terminals. Office, Montreal.

W. H. STEWART, heretofore chief clerk to H. H. Vaughan, Assistant to the Vice President, Montreal, and latterly acting Assistant Superintendent, Ottawa, has been appointed Assistant Superintendent, District 4, Eastern Division, vice J. H. Boyle, appointed Superintendent, District 3, Lake Superior Division, Schreiber, Ont., as announced in our last issue. Office, Ottawa.

R. C. MORGAN, heretofore Superintendent, Great Northern Ry., Spokane and Marcus, Wash., has been appointed Superintendent, Fort William Terminals, vice R. Armstrong, transferred. Office, Fort William, Ont.

A. MCARTHUR has returned to duty as Locomotive Foreman at Fort William, Ont., and A. Sturrock, who has been acting Locomotive Foreman, has returned to his former position as Back Shop Foreman at Fort William.

L. B. COPELAND, heretofore Roadmaster, Parry Sound, Ont., has been appointed Roadmaster, Regina subdivision, Saskatchewan Division. Headquarters, Regina.

District 3, Saskatchewan Division, heretofore covering the territory, Bredenbury to Hardisty, except Bredenbury; Neudorf to Lanigan, except Neudorf, Rosetown to Macklin, has been divided, and is now operated as Districts 3 and 4, respectively, as follows:—District 3: Wynyard subdivision, except Bredenbury; Neudorf subdivision; Lanigan subdivision, including Saskatoon. Superintendent, R. ARMSTRONG, heretofore Superintendent, Fort William Terminals, Manitoba Division, Fort William, Ont. Office, Saskatoon. District 4: Saskatoon subdivision, except Saskatoon; Wilkie subdivision; Kerrobert subdivision. Superintendent, H. H. BOYD, heretofore Superintendent, District 3, Saskatchewan Division. Office, Saskatoon.

R. A. JONES, heretofore locomotive driver, Moose Jaw, Sask., has been appointed Master Mechanic, Saskatoon, Sask., vice J. D. Watson, resigned.

G. WHITELEY, heretofore District Master Mechanic, Moose Jaw, Sask., has been appointed acting Master Mechanic, Saskatchewan Division, vice D. T. Main, on leave of absence. Office, Moose Jaw.

G. F. BURGESS has been appointed acting District Master Mechanic, District 2, Saskatchewan Division, vice G. White-

ley, appointed acting Master Mechanic, Saskatchewan Division. Office, Moose Jaw.

W. J. READER has been appointed Storekeeper at East Calgary, Alta., vice A. Clark, transferred.

A. C. HARSHAW, heretofore Trainmaster, Maintenance and Operation, Calgary Terminals, has been appointed Superintendent, Calgary Terminals. Office, Calgary, Alta.

J. G. RUTHERFORD, V.S., formerly Chief Veterinarian, Dominion Government service, Ottawa, has been appointed Superintendent of Animal Husbandry, Department of Natural Resources, reporting to J. S. Dennis, Assistant to the President. Office, Calgary, Alta.

D. G. McDONALD, heretofore Locomotive Foreman, Red Deer, Alta., has been appointed Assistant Foreman, East Calgary, Alta., roundhouse.

H. ALLAN, heretofore first class boiler maker, Calgary, Alta., has been appointed Assistant Boiler Inspector, Alberta Division. Office, Calgary.

D. H. FORD, heretofore Roadmaster, White River, Ont., has been appointed Roadmaster, Laggan subdivision, Alberta Division. Headquarters, Calgary.

J. W. CORMODE, heretofore chief clerk, Stores Department, Calgary, Alta., has been appointed Assistant Stores Inspector, vice F. G. Bannister, resigned.

W. J. WOOD, heretofore Storekeeper, Medicine Hat, Alta., has been appointed chief clerk, Stores Department, Calgary, Alta., vice J. W. Cormode, promoted.

A. A. SMITH, heretofore Trainmaster, Lethbridge, Alta., has been appointed acting Superintendent, District 1, Alberta Division, vice J. M. Cameron, on leave of absence. Office, Medicine Hat.

H. ALLEN has been appointed Assistant Boiler Inspector, Alberta Division.

A. CLARK, heretofore Storekeeper, East Calgary, Alta., has been appointed Storekeeper at Medicine Hat, Alta., vice W. J. Wood, transferred.

W. BELL, heretofore Bridge and Building Foreman, Medicine Hat, Alta., has been appointed acting Bridge and Building Master, there, vice W. H. Gordon, appointed Trainmaster, Red Deer, Alta., as announced in our last issue.

C. A. LITTLE, heretofore Locomotive Foreman, Alberta Ry. and Irrigation Co., Lethbridge, Alta., has been appointed Locomotive Foreman, C.P.R., Red Deer, Alta., vice D. G. McDonald, assigned to other duties.

W. H. MORTON, who was recently appointed Locomotive Foreman at Roseberry, Man., vice H. Ingram, resigned, has been appointed Shop Foreman at Kamloops, B.C., vice H. A. Keswick, resigned, and the position of Locomotive Foreman at Roseberry, Man., has been abolished.

W. E. HAYWARD has been appointed Locomotive Foreman at North Bend, B.C., vice C. H. Tedlock, resigned.

F. COCHRANE, heretofore conductor, has been appointed Night Yardmaster, Revelstoke, B.C. This is a new position.

Central Vermont Ry.—J. S. CARDER has been appointed Travelling Passenger Agent, New London, Conn.

Duluth, South Shore and Atlantic Ry.—E. R. LEWIS, formerly Division Engineer, Michigan Central Rd., Bay City, Mich., has been appointed Assistant to the General Manager, D. S. S. and A. Ry., and Mineral Range Rd., with duties as may be assigned to him from time to time by the Vice President and General Manager. Office, Duluth, Minn.

J. C. BEBB, formerly of the Michigan Central Rd. engineering department, is reported to have been appointed Assistant to Chief Engineer, D.S.S. & A.R., vice N. Cadarette. Office, Marquette, Mich.

Grand Trunk Pacific Ry.—H. A. WOODS, Assistant Chief Engineer, whose headquarters were removed from Montreal to Winnipeg, some time ago, has

again been transferred to Montreal.

J. A. HEAMAN, heretofore Division Engineer, Fitzhugh, Alta., has been appointed Assistant to Chief Engineer. Office, Winnipeg.

S. P. PORTER, heretofore Deputy Minister of Railways, Telegraphs and Telephones, for the province of Saskatchewan, Regina, is reported to have been appointed Executive Agent, G.T.P. R., with office at Regina, Sask.

E. FARRINGTON, heretofore chief clerk, Trainmaster's office, G.T.R., Ottawa, has been appointed chief clerk and secretary to Superintendent, G.T.P.R., Regina, Sask.

F. J. GEORGE, heretofore Assistant Engineer on construction between Tete Jaune Cache and Fort George, reporting to Division Engineer, Fitzhugh, Alta., has been appointed Division Engineer, Fitzhugh, Alta., vice J. A. Heaman, promoted.

A. WATT, heretofore Locomotive Foreman, Prince Rupert, B.C., has been appointed General Foreman there.

The following agents have been appointed:—Cabot, Man., A. Jackson; Gregg, Man., D. W. Peters; Grand Trunk Pacific Jct., Man., E. E. Blaine; Gerald, Sask., R. W. Gibson; Tate, Sask., G. V. Nowlan; Bradwell, Sask., T. W. Fleming; Biggar, Sask., J. O'Leary; Coblenz, Sask., H. E. Henshaw; Lestock, Sask., P. D. Hamilton; Ebenezer, Sask., P. L. Bolton; Camrose, Alta., A. McRae; Ryley, Alta., E. D. Young.

Grand Trunk Ry.—W. G. BROWN-LEE, General Transportation Manager, having resigned, the position has been abolished. Division superintendents, Superintendent Car Service and others, reporting formerly to the General Transportation Manager, will report, until further notice, direct to the Vice President in charge of operation, H. G. Kelly.

E. S. COOPER, heretofore acting Trainmaster, Districts 1 and 2, Eastern Division, has been appointed Trainmaster, District 1, Eastern Division. Office, Island Pond, Vt.

J. W. FARRELL, heretofore Trainmaster, Districts 1 and 2, Island Pond, Vt., has been appointed Trainmaster, District 2, Island Pond, Vt.

H. W. MATTHEWS, Trainmaster, Districts 25 and 29, Western Division, has had his office changed from Port Huron, Mich., to Battle Creek, Mich.

C. A. GORMALY, heretofore Commercial Agent, St. Louis, Mo., has been appointed Commercial Agent, Chicago, Ill., vice H. E. Graves, retired after 46 years continuous service with the system and its affiliated interests.

W. H. BURKE, heretofore Travelling Freight Agent, Chicago, Ill., has been appointed Commercial Agent at St. Louis, Mo., vice C. A. Gormaly, promoted.

J. A. BUCKNELL, heretofore Agent, Jackson, Mich., has been appointed Travelling Freight Agent, Chicago, Ill., vice W. H. Burke, transferred.

The following agents have been appointed:—Lacadie, Que., J. A. Langlois; Huntingdon, Que., E. E. Bourdon; Beauharnois, Que., E. Rheame; St. Dominique, Que., J. B. Cataford; Keene, Ont., P. Stinson; Uthoff, Ont., R. G. Winters; Kirkfield, Ont., G. Raymes; Allston, Ont., E. M. Ellis; Everett, Ont., E. N. Marshall; Grimsby Beach, Ont., J. A. Mitchell; Winona, Ont., S. A. Fairweather; Hespeler, Ont., N. A. Walford; Owen Sound, Ont., J. G. Heyd; Whitechurch, Ont., R. M. Patten; Ripley, Ont., W. M. Salkeld; Vankleek, Ont., G. A. Cass; Kilmarnock, Ont., O. B. Elliott; Wilno, Ont., G. H. Bates; Brule Lake, Ont., P. F. Madden; Sprucedale, Ont., H. W. Otta; Rose Point, Ont., R. J. Hardy; Beaverton, Ont., W. T. Byam; Stouville Junc., Ont., J. R. Hodgins; Brown Hill, Ont., S. W. Sterritt, Assistant; Greenfield, Ont., J. S. Gemmell; Pembroke, Ont., F. O. Parent; outside agencies: Galt, Ont., G. T. Misener; Ridgeway, Ont., J. G. Little; Sarnia, Ont., G. E. Wadland.

Hudson Bay Ry.—J. V. DILLABOUGH, heretofore office engineer, District F. National Transcontinental Ry., is reported to have been appointed to a similar position on the Dominion Government railway to Hudson Bay.

Intercolonial Ry.—J. GRAHAM has been appointed Foreman of Erecting Shop, Moncton, N.B., vice J. Nugent, superannuated.

Michigan Central Rd.—W. O. HOUSTON, heretofore on the engineering staff, has been appointed Division Engineer at St. Thomas, Ont., vice G. H. Harris.

J. H. MEGLEMYR has been appointed Division Freight Agent, Buffalo, N.Y., vice G. C. Ransom, resigned on his appointment as Chairman, Canadian Freight Association Eastern Lines, Montreal.

D. S. SUTHERLAND, heretofore Division Superintendent, Detroit, Mich., has been appointed General Agent, with such duties as may be assigned to him by the General Manager, and the position of Division Superintendent at Detroit has been abolished. Office, Detroit.

F. B. MARBLE, heretofore Division Engineer, Detroit, Mich., has been appointed Assistant to Chief Engineer, Detroit.

G. H. HARRIS, heretofore Division Engineer, St. Thomas, Ont., has been appointed Division Engineer, Detroit, Mich., vice F. B. Marble, promoted.

Prince Edward Island Ry.—J. E. R. McEWEN has been appointed Assistant Train Dispatcher, Charlottetown, P.E.I.

White Pass and Yukon Route.—J. L. McPHERSON, Civil and Mining Engineer, has been placed in charge of the Industrial Department, the purpose of which is to investigate the mining resources of Alaska and Yukon contiguous to the transportation property, and to aid in its development. Office, Skagway, Alaska.

C. J. ROGERS, heretofore acting Purchasing Agent, has been appointed Purchasing Agent, and the position of acting Purchasing Agent has been abolished. Office, Vancouver, B.C.

G. H. MILLER, heretofore acting Auditor, has been appointed General Auditor, and the position of acting Auditor has been abolished. Office, Skagway, Alaska.

H. WHEELER, who has been appointed Superintendent at White Horse, Yukon, vice W. Taylor, resigned, has charge of the River Division and the Mail Service Department, including stage lines.

The Northern Electric & Manufacturing Co.'s general supply catalogue no. 2 is now ready for distribution, and copies will be sent to every one regularly engaged in the electrical business whose name is at present on this company's mailing list. It is a large, well bound catalogue, with over 850 pages devoted to electrical supplies, telephone apparatus and fire alarm apparatus. An examination of the catalogue shows great care taken in compiling, particularly in the arrangement of the various sections, so as to make the location of any particular article quick and easy. The method of arrangement follows along the line of grouping the materials together in their various classes, thereby having the advantages of a separate bulletin catalogue, with the further advantage of the information all being under one cover, with no possible chance of being incomplete. Complete stocks of standard material listed in this catalogue are carried by the different branch houses at Montreal, Toronto, Winnipeg, Regina, Calgary, Edmonton and Vancouver, so that prompt shipment can be made to any part of Canada, and the delivery effected promptly.

J. W. Craigie, Goderich, Ont.; J. S. Giles, C.P.R., Lachute, Que., and F. Eastman, G.T.R., Danville, Que., have become members of the Canadian Ticket Agents Association.

Dominion Railway Subsidy Agreements.

The Dominion Government has entered into agreements, under the acts granting aid for the construction of railways, as follows:—

QUEBEC AND SAGUENAY RY.—From St. Joachim, northeasterly, 62.8 miles, June 29.

DOMINION ATLANTIC RY.—From Centreville to Weston, not exceeding 15 miles, in lieu of subsidy granted in 1908. July 2.

NORTHERN NEW BRUNSWICK and Seaboard Ry.—From Drummond Mines at Austin Brook to the Intercolonial Ry., and from the latter point to Alston Point, not exceeding 26 miles. July 18.

HA HA BAY RY.—From the Quebec and Lake St. John Ry., at or near Mathias, Jonquieres tp., Que., not exceeding 20 miles;

From Labrosse Jct., to the Saguenay river, northerly through Chicoutimi, not exceeding 5 miles;

From La Terriere Jct., southerly to Lake Kenogami, by way of La Terriere village, not exceeding 12 miles;

From Bagotville village, easterly to St. Alexis village, not exceeding 3 miles. July 18.

CANADIAN PACIFIC RY.—Towards the construction of a railway bridge over the Saskatchewan river, connecting

Strathcona with Edmonton, in lieu of subsidy granted in 1908. Aug. 2.

CANADIAN NORTHERN PACIFIC RY.—From the Yellowhead Pass to Vancouver and the mouth of the Fraser river, 525 miles. Aug. 7.

Eye and Ear Tests for Railway Employees.—The Board of Railway Commissioners' judgment in this matter was given fully in Canadian Railway and Marine World for August. An order has been set forth in a schedule attached to the order and entitled "Uniform rules governing the determination of visual acuity, color perception and hearing of railway employees on steam railways."

First Aid to Injured on the C.P.R.—In the article on this subject in Canadian Railway and Marine World for August reference was made to a number of places at which classes have been established, but Smiths Falls, Ont., was not mentioned. We are advised that this is the banner class in the Dominion, having at the examinations last autumn passed the largest number of first aid men of any class.

The Canada Railway News Co. has been given the contract for catering in the Fort Garry union station, Winnipeg. Alterations are to be made in the north wing on the ground floor, so as to provide adequate accommodation, and it is expected to open the restaurant during September.

The Fort Garry, the Grand Trunk Pacific Railway's Winnipeg Hotel.

This illustration, from the architect's drawing, shows the Grand Trunk Pacific Ry.'s hotel being built on Broadway, Winnipeg, opposite the Manitoba Club, and close to the Fort Garry union station. It is said it will be the equal of the Chateau Laurier, at Ottawa, in appearance and luxuriousness of appointment and will cost about \$1,000,000.

Bridge Construction on the Canadian Northern Pacific Railway.

Some details of the ten bridges on the Fraser and Thompson Rivers in British Columbia, for which tenders were being asked by the Canadian Northern Pacific Ry., were given in Canadian Railway and Marine World for July, pg. 337, mentioning the location and character of each bridge. We now republish the details, together with considerable further information as to the weight, method of erection, etc., of the bridges.

No. 1 will cross the Fraser River a short distance above the C.P.R. bridge, or about five and a half miles below Lytton. Starting from an abutment on the hillside at the west end, the structure will have three 40 ft. deck plate spans, supported by a steel bent and a steel tower, a 60 ft. plate girder span over the C.P.R. right of way, a 40 ft. tower span and tower, a 90 ft. plate girder span, a 424 ft. three hinged rivetted spandrel arch span and a 30 ft. plate girder span.

The substructure will consist entirely of concrete pedestals, those for the arch springing from solid rock, and the others, with enlarged bases, resting upon earth. The depth of the foundations of the latter cannot be determined until the excavations are made. At the easterly end of the structure the almost vertical face of the rock will have to be cut away in order to reach material sound enough to provide a satisfactory footing for the steel pedestals of the arch, and to give clearance for the end vertical posts thereof. The arch is to be erected by cantilevering from the rock bluff at the easterly end, and from the steel towers at the westerly end.

The approximate quantities of materials are:—Concrete in pedestals and abutments, and for filling column feet, 1,290 cubic yards; metal furnished specially for substructure and embedded in the concrete, 1,000 lbs.; solid rock removed from bluff at east end, 1,000 cubic yards; structural steel in arch span, including that temporarily used for cantilevering, 2,355,000 lbs.; structural steel in plate girder spans and trestle, 520,000 lbs.; lumber in deck, 124 M., B.M.; track, 775 lineal feet.

No. 2 will cross the Fraser River just below Lytton, about half a mile from the C.P.R. station. The portion of this bridge over the water will consist of a 292 ft. riveted span, with flanking spans of 150 ft. at each end, from which the centre span is to be erected by cantilevering. The approaches will be of deck plate girders supported by concrete piers.

The two main piers, of concrete, are to be put in by cofferdams; one of the side piers will be on bare rock, and the other piers and abutments are to be founded on earth in the dry. A small amount of riprap will be required for one of the main piers, and possibly for some of the others, but this cannot be determined until the excavations are made. The current of the river in the channel is swift, but at the sides it is moderate, and the bed is covered with rather large boulders, a combination which renders the use of false work for the middle span inadvisable, hence the side spans are first to be erected on falsework, and the main span is to be cantilevered from there; after which the toggles are to be removed and the bridge left as a single span structure. The upstream ends and the sides of the main piers are to be protected against grinding by metal plates.

Approximate quantities of materials:—Concrete in piers and abutments, excepting only the base of pier four (in which there will be 1,600 cubic yards), 6,900 cubic yards; metal for embedding in concrete, 2,000 lbs.; metal in pier protection, 26,000 lbs.; structural steel in truss spans, including that temporarily used for cantilevering, 2,345,000 lbs.; structural steel in plate girder spans, 510,000 lbs.; timber in deck, 124 M., B.M.; track, 981 lineal feet.

No. 3 will cross the Thompson River a very short distance above the mouth and within the town limits of Lytton. At the west end of the bridge there is to be a concrete abutment supporting a 90 ft. plate girder span, following which there will be three 150 ft. deck, open webbed, riveted girder spans, the westerly one resting on either a small concrete abutment or a bearing cut into the solid rock. The concrete piers are all to be parallel to the current.

The foundations for the piers are of solid rock, and the construction will be in the dry at a comparatively low stage of water. The spans will be on a skew. No protection will be required against ice. The current is very swift, from seven to 11 miles an hour, but the low water channel is quite narrow.

Approximate quantities of materials:—Concrete in piers, pedestals and abutments, 3,870 cubic yards; metal embedded in concrete, 1,000 lbs.; rock excavation from bluffs, 40 cubic yards; structural steel in truss spans, 1,134,000 lbs.; structural steel in plate girder spans, 140,000 lbs.; timber in deck, 130 M., B.M.; track, 580 lineal feet.

No. 4 will cross the Thompson River midway between Spatum station and Black Canyon siding, on the C.P.R. The superstructure will consist of six 125 ft. deck, open webbed, riveted spans, supported by five concrete piers and two concrete abutments. Four of the piers have to rest on pneumatic caissons, and the other pier and abutments are to have ordinary earth foundations.

Approximate quantities of materials:—Concrete in shafts of piers and in abutments, 1,750 cubic yards; mass of bases in pneumatic piers, 1,700 cubic yards; mass in base in open dredging pier, 285 cubic yards; piles below cutting edges of base, 1,000 lineal feet; metal embedded in concrete, 6,000 lbs.; metal in cutting edges, 50,000 lbs.; structural steel in truss spans, 1,724,000 lbs.; timber in deck, 156 M., B.M.; track, 780 lineal feet.

No. 5, which will cross the Thompson River about six miles below Ashcroft, will consist of a single through truss span of about 16 ft., resting on little concrete abutments that are resting on solid rock. As the final survey of this crossing has not yet been made, the span length may have to be changed later. As the bridge is located over a narrow deep gorge, it will be necessary to erect by cantilevering and anchoring back into the solid rock.

Approximate quantities of materials:—Concrete in abutments, 380 cubic yards; metal embedded in concrete, 1,000 lbs.; structural steel in truss span, including that temporarily used for cantilevering, 500,000 lbs.; timber in deck, 22 M., B.M.; track, 190 lineal feet.

No. 6 will cross the Thompson River about two miles above Ashcroft. It will consist of six 93 ft. deck plate girder skew spans on concrete piers having shafts parallel to the current. These shafts will rest on cribs containing concrete and piles, if the latter can be driven, as in all probability they can by using water jets, for the material to be penetrated is mainly sand and gravel, covered in many places with boulders.

Approximate quantities of materials:—Concrete in shafts of piers and abutments, 2,120 cubic yards; mass of bases of piers, 1,820 cubic yards; metal embedded in concrete, 1,000 lbs.; metal in cutting edges, 45,000 lbs.; structural steel in plate girder spans, 783,000 lbs.; timber in deck, 75 M., B.M.; track, 555 lineal feet.

No. 7, which will cross the Thompson

River another mile above Ashcroft, will be on a skew. It will consist of twelve 85-ft. deck plate girder spans, resting on 11 concrete piers and two concrete abutments.

For about half the foundations it will probably be advisable to use cofferdams, and for the other half cribs. Piles are to be used in every foundation where it is possible to drive them.

Approximate quantities of materials:—Concrete in shafts of piers and in abutments, 2,760 cubic yards; mass of bases of piers, 3,410 cubic yards; piles below cutting edges of bases of piers, 18,200 lineal feet; metal embedded in concrete, 3,000 lbs.; metal in cutting edges, 43,000 lbs.; structural steel in plate girder spans, 1,436,000 lbs.; timber in deck, 146 M., B.M.; track, 1,055 lineal feet.

No. 8 will bisect the Thompson River about a mile below Wallachin. It will consist of 11 93 ft. deck plate girder, skew spans. These will rest on 10 concrete piers and two concrete abutments to be founded on piles, if they can be driven.

It will be advisable to employ cofferdams instead of cribs for the building of some of the piers. Riprap of large stones will be required round each pier. The depth of the foundations cannot be determined until the excavation is done.

Approximate quantities of materials:—Concrete in shafts of piers and in abutments, 2,290 cubic yards; mass of bases of piers, 1,820 cubic yards; metal embedded in concrete, 1,000 lbs.; riprap, 660 cubic yards; structural steel in plate girder spans, 1,455,000 lbs.; timber in deck, 140 M., B.M.; track, 1,030 lineal feet.

Bridge No. 9 will cross the Thompson River almost midway between Wallachin and Savonas, which stations are some seven miles apart. At the west end of the bridge location there is a rocky hill from the foot of which the bridge will start with a through skew span of about 200 ft., then will come six half through, plate girder skew spans of 91 ft. each. These spans will rest on concrete piers and abutments.

The west abutment will be built in the dry; no. 1 pier, the east abutment and two or three of the other piers will require the use of coffer dams, and the remaining piers will rest on cribs filled with concrete and piles. The water is deep and swift, and the bottom is so paved with large boulders as to be practically impenetrable, so that the erection of falsework for the long span is out of the question.

Probably the most satisfactory and economical method would be to use three barges thoroughly braced together horizontally at their tops and carrying timber falsework braced substantially in vertical planes. The metal would have to be barged out from up stream and let down by lines from deadmen. By always adhering to as symmetrical and uniform a distribution of metal over the falsework as possible, cantilevering the two end panels beyond the barges, keeping the metal at all times well above its final elevation, and letting water into the barges when the steelwork is all up and connected, no serious inconvenience would be encountered in the erection of this span. It would be only sudden fluctuations of water level that could cause trouble; but from the time that the high water is over in the autumn until about the middle of April no material rise of the water level is likely to occur. The other spans, of course, would be erected in the usual manner by travelling derrick.

Approximate quantities of materials:—Concrete in shafts of piers and in abutments, 4,610 cubic yards; mass of bases of piers, 2,150 cubic yards; piles below cutting edges of bases of piers, 2,600 lineal feet; metal embedded in concrete, 1,000 lbs.; metal in cutting edges, 24,000 lbs.; structural steel in truss span, 570,000

lbs.; structural steel in plate girder spans, track, 756 lineal feet.

No. 10 will cross the North Thompson River some four miles by water from Kamloops. It will consist of thirteen 93-ft. deck plate girder spans resting on fourteen concrete piers.

For the present there will be no abutments, as there is to be a wooden trestle at each end of the structure. One of the spans will be lifted from two steel towers in order to permit the passage of river steamers, which at certain stages of the water navigate the stream. Long piles sunk by water jets are to be used, and there will be no difficulty in sinking any of the cribs to the required depths. The operating machinery for the lift span is to consist of a 12 h.p. gasoline engine.

Approximate quantities of materials:—Concrete in shafts of piers, 1,910 cubic yards; mass in bases of piers, 3,290 cubic yards; piles below cutting edges of bases of piers, 29,000 lineal feet; metal embedded in concrete and for pier protection, 29,000 lbs.; structural steel in plate girder spans, towers, dolphin-chains and counterweights, 1,886,000 lbs.; machinery metal of every kind, except wire ropes with their attachments, gasoline engine and all its appurtenances, 33,000 lbs.; wire ropes, 3,700 lbs.; attachments for wire ropes, 1,000 lbs.; wire rope dressing 100 lbs.; concrete in counterweights, 53 cubic yards; piles in dolphins, 2,100 lineal feet; timber in deck, 160 M., B.M.; track, 1,209 lineal feet.

The contracts call for the completion of the substructure work as follows:—Piers for the main span of bridge 9, Dec. 1; entire substructures of bridges 1, 2, 3 and 4, by Jan. 1, 1913; entire substructures of bridges 6, 7, 8 and 10, by Feb. 1, 1913; remaining piers of bridge 9, by Mar. 1, 1913. The contracts fix the following dates for the completion of the superstructures:—Feb. 1, 1913, main span of bridge 9; Mar. 1, 1913, bridge 5; Mar. 15, bridge 4; April 1, 1913, spans of bridge 10; May 1, 1913, bridges 6, 7, 8, and the remaining spans of bridge 9; May 15, 1913, bridges 2, 3, and the towers and machinery of bridge 10; June 1, 1913, bridge 1.

The plans and specifications were prepared by Waddell and Harrington, Consulting Engineers, under whose supervision the construction will be carried out. The substructures for bridges 1, 2, 4, 5, 6, 7 and 10 will be built by Armstrong, Morrison & Co., Vancouver, B.C.; and that for bridge 3 by the John Galt Engineering Co., Winnipeg, Man. The contracts for the substructures at bridges 8 and 9 were not definitely let, but we are advised they will probably be let to C. F. Graff, Seattle, Wash. The Dominion Bridge Co. will erect the superstructures of bridges 1, 2, 3, 5, 9 and 10; and the Canadian Bridge Co. will erect bridges 4, 6, 7 and 8.

Prevention of Fires Along Railways.

The Canadian Pacific, Canadian Northern, and Grand Trunk Pacific railways applied to the Supreme Court, at Ottawa, Aug. 8, for leave to appeal against certain sections of order 16570 of May 22, 1912, issued by the Board of Railway Commissioners prescribing regulations to be adopted by the railways under its jurisdiction, with a view to preventing forest fires along their rights of way. The order was issued following an application of the British Columbia Lands Department, supported by the Forestry Branch of the Dominion Conservation Commission. The order was given in full in Canadian Railway and Marine World July, pg. 342.

The section providing that the companies shall have inspectors at terminal or divisional points where its locomotives are housed and repaired, and prescribing the duties of such inspectors regarding fire protection and equipment, was argued by the applicants to be outside

the Board's jurisdiction, but the Court held that there was no arguable case, and refused leave to appeal.

On the question that any authorized officer of the Board might inspect at any time any and all locomotives, and remove from service such as are not considered properly equipped with fire protective appliances, the Court held that the Board's jurisdiction in so far as it delegated its power to an officer, might be called in question, the Board itself might do it, and by amendment, the Board might bring this section within its jurisdiction.

The section forbidding the use of lignite coal is one on which the Board has jurisdiction, but the question was adjourned to the fall sitting of the Court, as was also the application re the section providing that the chief fire inspector shall send to each railway every year regulations which the companies are required to comply with, on the question of delegation of authority by the Board, which the Court considers might be got over by amendment, the time being allowed in order that the British Columbia Government might suggest such amendment if wanted.

The section providing that sectionmen and other railway employees shall take measures to report and extinguish fires along the right of way, was declared to be within the Board's jurisdiction and leave to appeal was refused.

Railway Connections and Interswitching at Galt.

As a result of a joint sitting of the Board of Railway Commissioners of Canada and the Ontario Railway and Municipal Board, the following order, 17064, was issued by the Board of Railway Commissioners under date of July 5:—

Re applications of the boards of trade of Galt, Preston, Hespeler, Berlin, and Waterloo, Ont., for an order directing the C.P.R., the G.T.R., the Galt, Preston and Hespeler St. Ry., and the Preston and Berlin St. Ry. Co. to connect their tracks in Galt, Preston, Hespeler, Berlin and Waterloo, so as to admit the safe and convenient transfer or passing of engines, cars, and trains from the tracks of one of the above to those of the others, and that such connections shall be maintained and used by the said railway companies, respectively. Upon the hearing of the application at a joint session of the Board of Railway Commissioners for Canada and the Ontario Railway and Municipal Board at Galt, Ont., June 20—

It is ordered that the G.T.R. and the Galt, Preston and Hespeler St. Ry. tracks be connected in the towns of Galt, Preston and Hespeler, and that the G.T.R. and the Preston and Berlin St. Ry. tracks be connected in Berlin and Waterloo, at points to be agreed upon between the said companies within ten days from the date of this order, for the purposes applied for, and for the reasonable receiving, forwarding, delivering, and interswitching of traffic between the said railways; that plans showing the locations of said connections be submitted for the approval of an engineer of the Board of Railway Commissioners; that in the event of the companies failing to agree upon the said points of connection, the same be fixed by the Chief Engineer of the Board of Railway Commissioners; that the work of construction be done by the respective railway companies on their own rights of way, provided that the Galt, Preston and Hespeler St. Ry. and the Preston and Berlin St. Ry. do the work of overhead wiring on the property of the G.T.R. as well as upon their own rights of way; that the question of the distribution of cost be reserved for further consideration, except that with regard to the interchange connection at Hespeler, the work, by agreement, be done by Mr. Cribbs to the satisfaction of an engineer of the

Board of Railway Commissioners, he having undertaken it for \$1,000, and that the determination of the proper inter-switching rates be reserved until the matter has been reported upon by the Traffic Officer of the Board of Railway Commissioners.

Transportation Conventions in 1912.

Sept. 9.—International Association of Ticket Agents, Muskoka, Ont.

Sept. 10-13.—Roadmasters' and Maintenance of Way Association, Buffalo, N.Y.

Sept. 10-13.—Master Car and Locomotive Painters' Association of United States and Canada, Denver, Col.

Sept. 12.—American Association of General Passenger and Ticket Agents, Seattle, Wash.

Oct.—American Railway Bridge and Building Association, Baltimore, Md.

Oct. 7-11.—Association of Transportation and Car Accounting Officers, Chicago, Ill.

Oct. 7-11.—American Electric Railway Association, Chicago, Ill.

Oct. 8-9.—Canadian Ticket Agents' Association, Ottawa, Ont.

Oct. 15-17.—American Railway Bridge and Building Association, Baltimore, Md.

Oct. 17-19.—American Association of Dining Car Superintendents, Denver, Col.

Oct. 23-25.—Society of Railway Financial Officers, Atlantic City, N.J.

Nov. 6-10.—Association of Railway Electrical Engineers, Chicago, Ill.

Nov. 15.—American Railway Association, Chicago, Ill.

Nov. 15-16.—American Association of Freight Traffic Officers, Chicago, Ill.

Nov. 19-21.—Maintenance of Way Master Painters' Association, Chicago, Ill.

Dec. 12-13.—Association of Transportation and Car Accounting Officers, Louisville, Ky.

Railway and Allied Associations, Clubs, Etc.

The names of persons given below are those of the secretaries.

CANADIAN CAR SERVICE BUREAU, J. E. Duval, 401 St. Nicholas Building, Montreal.

CANADIAN FREIGHT ASSOCIATION (Eastern Lines), G. C. Ransom, Canadian Express Bldg., Montreal.

CANADIAN FREIGHT ASSOCIATION (Western Lines), W. E. Campbell, 502 Canada Building, Winnipeg.

CANADIAN RAILWAY CLUB, J. Powell, St. Lambert, Que. Meetings at Montreal 2nd Tuesday each month, 8.30 p.m., except June, July and August.

CANADIAN SOCIETY OF CIVIL ENGINEERS, C. H. McLeod, 413 Dornestor St. West, Montreal.

CANADIAN STREET RAILWAY ASSOCIATION, Acton Burrows, 70 Bond Street, Toronto.

CANADIAN TICKET AGENTS' ASSOCIATION, E. de la Hooke, London, Ont.

CENTRAL RAILWAY AND ENGINEERING Club of Canada, C. L. Worth, 409 Union Station, Toronto. Meetings at Toronto 3rd Tuesday each month, except June, July and August.

EASTERN CANADIAN PASSENGER ASSOCIATION, G. H. Webster, 54 Beaver Hall Hill, Montreal.

ENGINEERS' CLUB OF MONTREAL, R. W. H. Smith, 9 Beaver Hall Square, Montreal.

ENGINEERS' CLUB OF TORONTO, R. B. Wolsey, 94 King St. West, Toronto.

NOVA SCOTIA SOCIETY OF ENGINEERS, A. R. McCleave, Halifax, N.S.

QUEBEC TRANSPORTATION CLUB, J. S. Blanchet, Quebec.

WESTERN CANADA RAILWAY CLUB, W. H. Rosevear, 25½ Princess St., Winnipeg. Meetings at Winnipeg 2nd Monday each month except June, July and August.

Grand Trunk Pacific Railway Construction.

Collingwood Schreiber, Dominion Government Consulting Engineer, returned to Vancouver, B.C., Aug. 8, after having completed a trip of inspection over the line and the sections under construction in British Columbia. He stated that he was satisfied with the progress made and the character of the work done. The work, however, had been held up to some extent by strikes, but these had not been so extensive as had been reported. There was also some shortage of labor. He was of opinion that the line would be completed through to the Pacific coast before the end of 1914, although there will be a great deal of finishing up work to be done after the track had been laid.

A. W. Smithers, Chairman of the Board, and E. J. Chamberlin, President, arrived in Winnipeg, Aug. 12, on an inspection trip. They planned a trip to the end of the steel west of Edmonton, returning to Edmonton and proceeding thence by C.P.R. to Vancouver; from that place by steamer to Prince Rupert, and east by rail to the end of track. On the return journey it is proposed to make an inspection of the several branch lines under construction. Both Mr. Smithers and Mr. Chamberlin stated that there was nothing to announce as to future plans; the trip was being made for the purpose of seeing the work which was in progress, and of obtaining information upon which future developments would be decided.

It is said that a union station will be erected at Edmonton, in conjunction with the Edmonton, Dunvegan and British Columbia Ry. Press reports state that the building will be two stories high, with a frontage of four city blocks, and that the train shed will have six sets of double tracks, with four platforms.

We are officially advised that a contract has been let to the Canadian Stewart Co. for the erection of an hotel in Edmonton at a cost of about \$750,000.

Track has been laid through Tete Jaune Cache to mileage 53 in British Columbia. This will be the terminus for some time, as the Fraser River is being utilized to get supplies in as far as Fort George. The contractors have met with an unexpected setback at the Goat River, where a quicksand has been struck in a 1,000 ft. tunnel which is being driven there. It is expected to have the steel laid to the Shuswap River, 50 miles beyond the present rail head, by Oct. 1, and to have the grading and bridgework as far as Smithers ready for the steel laying gang by Nov. 1.

From the western end track has been laid to mileage 171, and it is reported that as soon as the bridgework is completed, which, it is expected, will be early in the fall, track can be laid as far as Aldermere.

GRAND TRUNK PACIFIC BRANCH LINES.

The mayor of Brandon, Man., has been advised that the construction of the branch line into Brandon will be undertaken at once, but it will not be completed this season, as its construction involves the erection of a large bridge across the Assiniboine River.

The Board of Railway Commissioners has authorized the operation of trains over the Canadian Northern Ry. in Regina, Sask. This is on the line from Melville, Sask. On the line southerly from Regina to the International boundary track has been laid to Cedux, and it is expected that track will be laid to Froisher, near the boundary, by the end of the year. Press reports state that construction is to be started at once on a line from Cedux into Weyburn.

In connection with the line under construction from Regina to Moose Jaw, Sask., an agreement has been reached as to the route through the city. The plans are before the Board of Railway Com-

missioners for approval, and the right of way is being acquired. Track is reported to have been laid for about 10 miles on the branch north-westerly from Moose Jaw, and it is further reported that considerable grading has been done on the branch running out of Moose Jaw westerly.

Ballasting is reported to have been completed between Young and Wakow on the branch line from Young to Prince Albert, Sask, but no further tracklaying has been done. The construction of the branch involves the erection of a bridge across the South Saskatchewan River, but it is said that this will not be started until next year.

Tracklaying on the branch from near Biggar to Battleford was started in July, and about 10 miles is reported to have been laid. Grading has been completed as far as Battleford, and for some distance beyond into the Cutknife district. For this extension revised location plans have been approved for 13 miles between mileage 26.26 and 38.74 by the Board of Railway Commissioners.

It is expected to complete tracklaying on the branch from Biggar towards Calgary, as far as Lovearne this season. This branch will connect with the Tofield-Calgary line near Swallow, Alta. This latter branch is being operated as far as Trochu, 121 miles, and track is reported to have been laid 14 miles further on. It is expected to have track laid to Irricana, 35 miles further south, this season. The grading has been practically completed into Calgary. A Calgary press dispatch states that there is a prospect of track being laid into Calgary this year. The erection of the bridge across the Elbow River may delay matters somewhat, as this will not be progressed with until the company can haul in the material over its own line.

In an interview in Winnipeg, M. Donaldson, Vice President and General Manager, is reported as stating that in addition to completing the branch under construction from Bickerdike, Alta., to the Brazeau coal fields, a branch will be built from Bickerdike in a south-westerly direction. A coal mining company is also proposing to build about 30 miles of lines to connect its mines with the G.T.P. Ry. lines in the district. (Aug., pg. 413.)

National Transcontinental Railway Construction.

Recent press reports from Fredericton, N.B., state that three gangs of section men have been placed on the line between Moncton and Grand Falls, N.B., and are at work under the direction of T. C. Burpee, Engineer of Maintenance of Way, Intercolonial Ry. It is added that the local understanding is that the Intercolonial Ry. will shortly establish a train service on the line, pending its being taken over by the G.T. Pacific Ry.

In an interview at Quebec, Aug. 11, R. W. Leonard, Commissioner, is reported as stating that he had been studying the question of the terminal in Quebec. He had a conference with W. Wainwright, Vice President, and a representative of the engineering staff of the G.T.P. Ry. on the matter. It is proposed to make some changes in the plans, which will be submitted to E. J. Chamberlin, President, upon his return from the west early in September.

M. J. O'Brien is reported as stating that grading is completed on the section of the line he is building to 150 miles east of Cochrane, Ont., with the exception of about 35 miles, which he expects will be finished this year. Track has been laid over the greater portion of this mileage, and will be completed early next year. Track is laid from Cochrane easterly practically to a junction with the O'Brien contract. It is expected, adds Mr. O'Brien, that the whole line from Quebec to Coch-

rane will be ready for traffic, except for the finishing up process, by June 30, 1913.

Track is laid for over 250 miles west of Cochrane, and on the section under construction between track end and Superior Jct. temporary trestle bridges are being erected, in the expectation of connecting up the steel, so that it may be possible to run grain trains over the line and out to eastern points via the Timiskaming and Northern Ontario Ry. and the G.T.R. during the winter.

Traffic Orders by the Board of Railway Commissioners.

The dates given for orders are those on which the hearings took place, and not those on which the orders were issued:—

Rates on Gas House Coke.

16707. June 4. Re complaint of Consumers' Gas Co. of Toronto complaining that rates on gas house coke from Buffalo to Hamilton, Brantford, and Toronto create an unjust discrimination in favor of Buffalo and against Toronto; and re order 16453, dated May 6, 1912, made therein; and re the application for an order to amend the said order, upon reading what is alleged, and the consent of parties interested, it is ordered that order 16453, be amended by substituting the words "forty thousand pounds" for the words "thirty thousand pounds" where they occur in the said order.

Grand Trunk Pacific Railway Tariff.

16922. June 28. Re application of G.T. Pacific Ry., under sec. 327 of the Railway Act for an order approving of its Standard Freight Mileage Traffic C.R.C. 10, between its stations in Alberta, Thornton to Fitzhugh, inclusive, it is ordered that the said tariff be temporarily approved, pending the result of the enquiry by the Board into the rates charged generally by the railway companies west of and including Crowsnest, Canmore and Thornton.

Vancouver, Fraser Valley and Southern Railway Rates.

16939. July 4.—Re order 16225, April 3, prescribing local tolls of Vancouver, Fraser Valley & Southern Ry. on lumber and other forest products, in carloads, between stations on its railway, and the joint through rates on the said lumber and other forest products, in carloads, from its stations between Vancouver and New Westminster to points on the Canadian Pacific and Canadian Northern Railways via Vancouver or New Westminster: Upon the failure of the V.F.V. & S. Ry. to file tariffs of its rates, so as to comply with the requirements of the order, although repeatedly urged, under the direction of the Board, to do so—it is ordered that the railway company be subject to a penalty of \$25 a day for every day after July 10 it shall be in default in complying with the requirements of the said order.

Stop-off Arrangements East of Toronto, Ont.

17179. July 22.—Re application of British-Canadian Cannery, Ltd., and the notice calling upon the G.T.R. to show cause why the "stop-off" arrangement with respect to canned goods, as shown in item 4 of the company's Special Freight Tariff C.R.C. E. 2374, applicable west of Toronto only, should not be extended so as to include Bowmanville and Cobourg as stop-over points; it is ordered that the stop-over privileges granted by the said railway companies operating from the Niagara Peninsula, westward, in Ontario, be granted the applicants at the two points east of Toronto, namely, Bowmanville and Cobourg, Ont.

The Grand Trunk Pacific Ry. has advanced the wages of its track repair laborers to a minimum basis of \$2 a day, and the foremen to a minimum of \$79 a month.

The Handling of Section Gangs.

By T. Hickey, Roadmaster, Michigan Central Rd., St. Thomas, Ont.

The majority of our track laborers on sections in this country are English speaking, although I have on a few sections some foreigners, Greeks, Italians and Austrians. Our yard forces are composed of English speaking men and foreigners, the latter in the majority, as we find it more difficult to hire and hold English speaking men in the larger cities, although we pay laborers in yards five cents a day more than is paid on out-lying sections.

Our system is to hire our summer force commencing April 1, and work them until about November 1, reduction of forces of about 35% is then made during the winter months. If summer forces are hired April 1, we can usually get all the men we want at that time, and as a general thing they will work all through the summer months, but if we do not hire our summer forces on April 1, the men whom we expect to get will hire out elsewhere, and the chances are that the section foremen, on several sections, at least, will be short of men the greater part of the summer. It is important to hire summer forces early in the season, as by so doing the required number of men can easily be obtained by the foremen and better men can be secured. Foremen have men engaged for their summer force, in the majority of cases, expecting to be instructed to hire them April 1st. Should anything prevent and the foremen are not instructed, there is a disappointment. The men go in search of employment elsewhere, which results in a shortage of men on sections during the season, more particularly in small towns.

Where section headquarters are so located that there is no available house for the foreman to rent in which to live, a house is provided by the company, for which the foreman should pay a nominal rent, sufficient to pay 5% on the money invested. It is a great advantage to have the foremen and their laborers, when possible, live in the company's houses, as the roadmaster would then know where to find them on short notice, if wanted at night. Foremen and laborers should be allowed to cultivate for garden purposes a small patch of ground on the right of way, where there would be no objection to doing so. It would be an encouragement to the men and no detriment to the company; in fact, it would be a benefit, as such cultivating may prevent fire from spreading and will keep down obnoxious weeds.

Section foremen make a weekly work report. They are furnished a form on which to make such reports. On this report is shown the number of men employed each day and the amount and kind of work performed each day. It is surprising to note the interest taken by the different foremen in increasing their daily output of work, as each foreman tries to see if he cannot do a little more than his neighboring foreman.

Some 20 years ago section laborers were almost universally English speaking, and in most cases native Americans. Conditions have gradually changed, and now a large proportion of track laborers belong to inferior classes and foreign labor. As is to be expected under these conditions, it is getting difficult to select suitable foremen.

To induce young men to enter the service, provision should be made, I think, to pay them a slightly higher rate than the average laborer's rate to one man in each gang, with the understanding that he remain in the service and be given opportunity to develop into a foreman. This would encourage at least a few good bright young men to enter the track service and remain, and would be the means of selecting good foremen. It is the am-

bition of a good roadmaster to have an organization of good foremen about him, the work of which he should appreciate.

With the rapid change taking place in the character of forces making up extra gangs, the methods of organization of ten years ago have become inapplicable. The roadmasters who have studied conditions and revised their methods to meet these changed conditions are making the least complaint about the quality of the present labor. While the labor is not all that could be desired, in many cases the man who complains is not getting from it all that he can. Its quality will scarcely improve, and the problem facing the roadmaster is so to arrange his forces as to get the best results from the labor available.

A roadmaster has several first class section foremen from whom he can select extra gang foremen. To change a foreman from a section to an extra gang should be considered a promotion and recommendations for the position of assistant roadmaster can be made from extra gang foremen, according to ability shown and not on account of personal likes and dislikes, as is often the case. A section foreman used on extra gangs should not tend to demoralize the section organization. There is scarcely ever a time when a section foreman is promoted to an extra gang, but the roadmaster has a foreman ready to take charge of the section. The promotion of a section foreman should not disrupt the organization any more than the promotion of an assistant roadmaster to that of roadmaster, or assistant superintendent to that of superintendent.

Material should always be carefully distributed in advance of a gang so that there would be no delay or loss of time. The foreman should so place his men in doing the work that each man would do his part. For instance, in relaying rails he would place a certain number of men pulling spikes, a certain number of men adzing, wrenching, on tongs, spiking, etc., so that it will not be necessary to be continually changing some of the men from one place to another, with the consequent loss of time. This is particularly true with foreign labor; the same method can be carried out in doing other work.

A foreman should be furnished with a copy of all estimates of the cost of the work he is in charge of, to illustrate the advantage to the foreman of having such information as to the cost of work, and to give him a chance to do better than the estimate, or to explain its discrepancy.

A foreman should have good judgment and be familiar with the methods he intends to employ, both in the performance of his work and with different classes of labor. He should have force of character enough to uphold his opinion and give his men the impression that he thoroughly understands what he is doing. When a gang is organized, the first day is usually a try out between the foreman and the men, as the gang is usually composed of some men at least who have had some experience in the class of work they are about to engage in. If he has confidence in his own ability, the foreman will start in as if he had just moved from one portion of the work to another; the gang will have confidence in him at once; results will be shown from the start.

The foreman should have authority to hire his assistant foreman and timekeeper (timekeeper should be under bond); he should have power to hire and discharge without interference. His decision should be supreme as far as the organization of his gang is concerned. Roadmasters and other officials should judge him only by results obtained. The

roadmaster should examine his requisitions for tools, etc., and look over such requisitions with him on the ground. Tools and other supplies and material should be furnished promptly. If requisitions are required the gang is hindered in making the progress it should, and this often reflects on the foreman on account of slow progress of the work, while in reality the fault is not his. Daily work reports should be made each day by the foreman, showing the number of men employed, the amount and kind of work performed, and these should be forwarded to the office of the division engineer and roadmaster; blank forms for such reports should be furnished the foremen.

Extra gangs should not be moved for small jobs. Instead of taking the extra gang away from an assigned job, and moving them perhaps a considerable distance, combine two section gangs for perhaps a day or two and complete the job. A foreman is given credit according to the cost of the work, not according to the labor actually spent upon it, and the cost of transportation is not always figured in the estimate.

A foreman who is doing good work and giving good results, as a rule, has complaints made against him frequently. I have noticed where other departments made it unpleasant for the foreman, who has been told that if he cannot get along without so many complaints that there would be a change of foremen.

For the last five years I have dispensed with the services of interpreters in gangs of foreign laborers, after which I found that trouble with the men is minimized and greater efficiency is apparent.—Railway Engineering and Maintenance of Way.

Dominion Government Railway to Hudson Bay.

Hon. F. Cochrane, Minister of Railways, left Winnipeg August 9 for Selkirk, whence he took a steamboat for the head of navigation and thence on to Norway House. From this point it was arranged that he should travel by canoe to Port Nelson, to investigate the suitability of that port as a terminus of the railway under construction from Le Pas. At Port Nelson, the Dominion Government steamship Nelson was to be in readiness to convey the Minister to Fort Churchill the other port named as a possible terminal. The Minister was then expected to travel by the Stanley to Halifax, N.S., to reach there Sept. 7. Prior to starting out Mr. Cochrane said he expected to be able to determine as the result of his trip, which of the two ports would be used as the terminus of the line.

Tenders have been invited to Sept. 12, 1912, for the completion of the line to Hudson Bay, contractors being asked to give prices for the work both to Port Nelson and to Fort Churchill. The object of this is the Minister explained that it will then be possible for the contractors to get to work during the winter.

Winnipeg press reports state that the contract for the second section of 68 miles ending near Split Lake, will be let to J. D. McArthur Co., which firm has the contract for the first section out of Le Pas. The dispatch says that the approval of the cabinet only is required to close up the matter. Split Lake is the point at which the surveys for the line diverge either to Port Nelson or to Fort Churchill, and it is from this point that contractors are asked to submit prices to both the suggested terminal points.

At a meeting of the Privy Council in Ottawa, held Aug 15, the tender of J. D. McArthur Co., was accepted for the building of the line from Thicket Portage to near Split Lake, 68 miles. The estimated cost of the work is \$1,825,000. The J. D. McArthur Co. is building the first portion of the line.

Electric Railway Department

Montreal Tramways Company's Report.

The following report for the period, Oct. 1, 1911 to June 30, 1912, was presented by the President, E. A. Robert, at the annual meeting in Montreal, Aug. 6:—

Gross earnings\$4,355,403.57
Operating expenses 2,618,943.65

Net earnings\$1,736,459.92

From which deduct:—

City percentage on earnings.\$279,030.17

Interest bonds and loans.... 449,513.67

Interest debenture stock..... 600,000.00

Taxes 50,850.00

1,379,393.84

Surplus\$ 357,066.08

From which has been appropriated for:—

Contingent account 150,000.00

Transferred to general surplus\$207,066.08

In view of the amalgamation of the Montreal St. Ry. Co., and its subsidiary companies under the name of the Montreal Tramways Co., the figures submitted cannot very well be compared with the same period last year, but your directors are pleased to state that the increase in gross earnings has been very satisfactory, and the ratio of operating expenses to earnings is also satisfactory.

Your directors have appropriated from surplus, \$150,000 for contingent account, this being in addition to \$85,000 appropriated for the same purpose during the above period, making a total credit to this account of \$235,000, against which has been charged the sum of \$107,351.87, leaving a balance at the credit of this account of \$127,648.13.

During the above period \$741,427.68 has been expended on capital account.

Your directors considered it advisable to insure the company's properties against fire, and the amount previously at the credit of the fire insurance fund, amounting to \$576,329.83, has been transferred to special capital reserve, which will be used as the directors may decide in the interest of the company.

During the past year the company secured an amendment to its charter whereby certain agreements and deeds of sale with the Montreal St. Ry. Co. and other companies were ratified. The town of Montreal West has granted an exclusive franchise to the company for 50 years.

The company reports that under the Imperial Privy Council judgment, the judgment rendered by the Board of Railway Commissioners with regard to through traffic and rates of fares in Mount Royal Ward was dismissed.

There are now only a few shares of the Montreal St. Ry. which have not been exchanged for this company's securities.

The property has been maintained in a proper state of efficiency, and a considerable sum has been spent in the upkeep of the tracks and rolling stock; the power plant and buildings are in excellent condition. The company has continued its liberal policy towards its employees in respect to wages, having increased them during the year. Owing to the continued rapid growth and congestion of the city your directors have been in negotiation with the city for the purpose of making a new contract which would be more applicable to the present day conditions.

In conclusion, your directors desire to place on record their appreciation of the valuable and faithful services rendered by its officers and employees.

STATISTICAL STATEMENT.

Operating expenses	\$2,618,943.65
Operating expenses	\$2,618,943.65
Net earnings	\$1,736,459.92

Nothing but routine business took place at the meeting, the report being adopted unanimously, and the officers being re-elected for the current year, as follows:— President, E. A. Robert; Vice President, J. W. McConnell; other directors, F. H. Wilson, Hon. J. M. Wilson, W. C. Finley, J. M. McIntyre, and G. G. Foster, K.C.

Underground Electric Railway Project for Montreal.

A letter was read at the Montreal city council meeting, Aug. 1, signed by A. E. Forget, Secretary of the Comptoir Financier Franco-Canadian, stating that a French syndicate, possessed of ample means, was about to apply for a franchise for an underground electric tramway system in the city. The letter set out that the company was actively engaged in preparing plans for the construction of an underground system of electric tramways, similar to those already in operation in Paris, France. Application would be made for parliamentary powers next session, and if the privileges sought were granted work would be started within two years. The proposed company would have a capital of \$100,000,000, which was to be furnished by a syndicate of French bankers. The members of the provisional company include M. J. Girard, M.P.; E. Lapointe, A. E. Forget and J. B. Charbonneau. Accompanying the letter was a draft-project, which the aldermen were invited to examine. In this project it was stated the company desired a 50 years' agreement, with powers of renewal. First and second class cars to be run on the underground trains. First class tickets to be eight cents each, and second class tickets four cents. Workmen's tickets to be sold at two cents each, good during certain hours. Trains to consist of five coaches, one of first class and four of second class, each coach holding about 110 passengers. The letter was referred to the board of control.

Cutter for Taper Plugs at the Halifax Electric Tramway Co.'s Shops.

Taper wooden plugs for filling up holes and recesses over the heads of bolts in various parts of the car body, are a very much needed article in a street car repair shop. The Halifax Electric Tramway Co. is no exception, save in so far as the method of making the plugs is concerned, for D. B. Logan, Foreman Machinist, has devised a method that is both unique and good. A cutter of the form indicated in the accompanying illustration forms the basis of the method. This cutter is gripped in a drill chuck in the head of a small speed lathe, giving the cutter thereby a high enough speed to satisfactorily cut wood. A piece of board of a thickness slightly over twice the depth of the required finish plug forms the stocks from which the plugs are to be made. This block is held on its rear surface against the spindle of the lathe stock, by

Cutter for Making Taper Plugs.

which it can readily be brought up to the rapidly revolving cutter. The particular lathe in use has a lever operated tail stock spindle, and in consequence, the spindle movement for bringing the work up to the cutter is particularly quick in action. The operator, holding the block of wood in one hand, with the other brings the tail stock spindle forward against the block, forcing it against the cutter until the latter has entered to about half its full depth. This operation is repeated very rapidly all over the face of the block. The block is then reversed, and the same operation repeated on that face, aligning the cuts as closely as possible to those made from the reverse side. This operation completes the cutting out of double taper pins, slightly over twice the length of the pins required. Running a saw cutter across the centre of these double pins, leaves them complete and ready for driving into the holes to be plugged. These plugs can be produced very rapidly by this method.

Electric Railway Regulation in British Columbia.

Under the authority of the Tramway Inspection Act, the Attorney General of British Columbia has issued regulations governing the operation of electric cars within the province. The new regulations, among other things, call for the installation of gates at the rear of all cars, which will be the only way of entrance and egress; the gates are to be under the control of the conductor; they are to be closed before the car starts, and are not to be opened until the car stops again. When a car is filled to capacity, which is to be fixed, no more passengers will be allowed on under penalty. The lowest step on each car is not to be more than 16 inches above the ground; on interurban cars a separate compartment must be provided for baggage and mail; provision is made for the standardizing of cars, and single truck cars are to be done away with as speedily as possible. All new cars are to be approved by the Inspector under the Tramway Inspection Act. All employees are to undergo an examination and eye test. The regulations which cover a number of other detail matters, come into force at once. The companies affected, the B. C. Electric Ry. and the Nelson Tramway Co., are given until the end of the year to make the required alterations in the cars.

Electric Railway Projects, Construction, Betterments, Etc.

British Columbia Electric Ry.—A. T. Goward, Local Manager, Victoria, is reported as stating Aug. 5, that the whole of the route for the Saanich line had been cleared, the greater portion of the grading done, and the track material delivered. It was expected to have track laid on the 22 miles in a couple of months, and to have the line opened by Jan. 1, 1913. The second track work on Hillside Ave., was well advanced, and the other betterments in the city were being progressed with satisfactorily. (Aug., pg. 421.)

Dunnville, Wellandport and Beamsville Electric Ry.—Press reports state that financial arrangements have been made for the completion and operation of the section of the line from Dunnville to St. Ann's, Ont. The directorate is stated to be in course of reorganization, and will in future consist of three representatives of St. Catharines' interests, and one each representing Toronto and Welland. (June pg. 308.)

Hamilton, Ont.—Press reports state that a project is under consideration for the building of a new incline railway to carry street cars to the top of the mountain. V. T. F. Webb, Hamilton, is reported to be interested.

Lake Eric and Northern Ry.—J. Muir, President, is reported as stating on his return to Brantford, Ont., Aug. 2, from Montreal, that the financing of the company had been arranged for, and that tenders for the building of the line would be called for immediately. Montreal press reports, Aug. 2, state that a meeting of directors was held in that city on the previous day, when an agreement was concluded with G. W. Farrel & Co. for the purchase of the entire issue of \$1,100,000 of 5% first mortgage bonds.

The annual meeting of shareholders will be held in Brantford, Ont., Sept. 4.

We were officially advised Aug. 19, that all of the tenders had not been received for the building of the line from Port Dover, via Brantford, to Galt. It is expected that these will be in and the contract let early in September. The northern portion of the line from Brantford to Galt will be put under construction first and it is hoped to have it completed this year.

Some changes were made in the directorate at the recent meeting of shareholders in Montreal. The board is now constituted as follows:—J. Muir, H. Cockshutt, L. Harris, J. Sanderson, Brantford, Ont.; R. Thompson, Paris, Ont.; F. H. Deacon, Toronto; Mr. Todd, Galt, Ont.; G. W. Farrell, Montreal.

Lethbridge Municipal Ry.—General Superintendent Reid reported, Aug. 8, that two of the cars had been delivered, and three more were on the way. He expected to be able to start the cars running Aug. 15, although the municipal power plant would not be ready for some time. The track construction work is in charge of Superintendent Doughty, and the overhead work in charge of W. Symonds. (Aug., pg. 421.)

Moncton Tramways, Electricity and Gas Co.—E. B. Reeser, President, is reported as stating that an arrangement has been made with the Moncton and Buctouche Ry., by which the company's cars will be run over the M. and B. Ry. as far as Humphreys. In order to carry out this agreement it will be necessary to extend the track from King St., along Harbor St. to the railway tracks. This work will be started as soon as the agreement is ratified. The city loop line will be completed in the fall, and should business warrant it, a summer park will be laid out in 1913.

Press report state that permission has been given the company to extend its John St. line to the Intercolonial Ry. shops, and that the work will be gone on with immediately. (July, pg. 367.)

Montreal and Southern Counties Ry.—The Board of Railway Commissioners has approved location plans for the extension from Renelagh to the boundary between Longueuil and Laprairie parishes. (Aug., pg. 421.)

Montreal Tramways Co.—Pending the completion of plans for the improvement and extension of the lines in the city, the company has started work on the renewal of 38 street intersections. Long ties are being used, so that four of the rails are tied together, thus providing the greatest possible stability. The rails are 132 lbs., instead of 96 to 116 lbs. formerly used. The concrete work and ballasting is being done by M. J. Stack and Co. J. D. Evans, Chief Engineer, is in charge of the work. (Aug., pg. 421.)

Morrisburg and Ottawa Electric Ry.—At a meeting of shareholders in Ottawa, Aug. 29, the directors asked for authority to complete arrangements for starting construction. Three proposals for securing an entrance into Ottawa were submitted for consideration. The directors are understood to have reported that the plans for financing construction were in a forward condition. Jas. Oliver is President, and R. A. Bishop, secretary. The company's offices have been moved from Morewood, Ont., to Ottawa. (June, pg. 309.)

Ontario West Shore Ry.—The position of the municipalities in connection with the guaranteed bonds of this partially built line was considered at a meeting held in Kincardine, July 24, when a committee was appointed to take some action. J. W. Moyes, Toronto, the promoter of the line, was present at a meeting of the committee, Aug. 1, at which a sub-committee was appointed to interview the Provincial Government to ascertain if a subsidy could be obtained to enable the line to be completed as a municipal undertaking, and to ask the Ontario Railway and Municipal Board to make an investigation as to the expenditure of the money secured for the bonds issued for principal and interest of which the municipalities are liable under their guarantees. (Mar., pg. 148.)

Ottawa and St. Lawrence Electric Ry. A meeting of shareholders was called to be held in Ottawa, Aug. 28, for the purpose of electing directors, perfecting the organization of the company and for the transaction of general business. J. E. Askwith, is chairman, and F. Iveson is secretary of the provisional directorate. (July, pg. 368.)

Ottawa, Rideau Lakes and Kingston Ry.—We are officially advised that as soon as the surveys for this projected line are completed, which it is expected will be early in Sept., the final details of the general contract for construction will be worked out. This general contract was arranged with British financiers in March, and covers the building and equipment of a line from Ottawa to Kingston, with a branch from near Lombardy, crossing the river at Rideau ferry, and proceeding thence to Perth, Bolderston and Lanark. The main line and branch will have a total length of 127 miles. The line will open up a territory that is at present almost without railway facilities. It is not probable that any construction will be done this season, but it is hoped to make a start early in the spring of 1913. U. L. Upson, Ottawa, is General Manager. (Aug., pg. 421.)

Port Arthur and Fort William Electric Ry.—The Port Arthur, Ont., city council passed a resolution June 30, adopting the route for the proposed belt line in the city. The construction is to be done under the superintendence of the chief engineer, and it is expected to have the new line in operation by the winter.

The Fort William, Ont., city council has decided to order the materials for the laying of street railway tracks on

Pacific Ave., Walsh and Franklin streets, and on Island 2. (Aug., pg. 421.)

Quebec Ry., Light and Power Co.—Track has been laid on Dorchester St. as far as the approaches of the proposed Drouin bridge, on the extension to Limoilou. As soon as the bridge is built, tracklaying will be restarted on the extension.

A number of improvements have been made at the St. Paul St. station, Montmorency division. A shed covering three platforms and four tracks has been provided, and an additional long track has been set apart for the pilgrimage traffic to St. Anne. (June, pg. 310.)

The Sarnia Street Ry. is erecting a new car barn. It is to be finished in the fall, and is estimated to cost about \$12,000. It will be 160½ ft. by 78 ft. 8 in. and will be built of solid blocks of concrete with prepared roofing. There will be five tracks the entire length of the building, giving a capacity of 15 cars, with two pits, one 90 ft. long, the other 150 ft. A workshop will be provided on the south side of the building, with a paint shop 38½ ft. by 59 ft. On the south west corner of the building there will be a superintendent's office and store room, with lavatory accommodation for employees. The machinery in the present shops will be utilized in the new one. (Aug., pg. 421.)

Simcoe Ry. and Power Co.—Press reports state that the company has under consideration plans for the building of an electric railway along its power transmission line from the Big Chute on the Severn river to Waubashene, Ont., for the construction of which the Ontario Legislature last session granted an extension of time. (Mar., pg. 149.)

Toronto Eastern Ry.—We are officially advised that considerable grading has been done on this line by the several subcontractors. No further subcontracts have been let.

The spur under construction from the Canadian Northern Ontario Ry. into Oshawa, Ont., is being built by the C. N. O. Ry. It will be operated by steam until the completion of the T. E. Ry., when it is probable that it will be operated electrically in conjunction with that line. (Aug., pg. 422.)

Toronto Suburban Ry.—The grading of the branch from Weston to Woodbridge, Ont., is practically completed, and it is expected to have the track laid in about a month. On the extension from Lambton to Guelph, W. Maher started work just west of Islington, and has the grading well advanced to Summerville, near where the line will be carried under Dundas st. No further subcontracts have been let. Right of way agents are at work at various points as far as Guelph, to which point the line is under contract to Ewen Mackenzie. (Aug., pg. 422.)

The Montreal Tramways Company and Its Employees.

The Montreal Tramways Co. has voluntarily increased its employees wages, the new scale, which has been put in force will date from July 1, the commencement of the financial year, under the present management.

The comparative rates of pay are as follows:

	Old rate.	New rate.
First and second year men	20c.	21c.
Third to fifth year men	21c.	22c.
Five years and over	22c.	24c.

On the whole, some 2,200 employees about \$100,000 a year. We are advised that the employees are well satisfied with the new rate.

The Board of Railway Commissioners has asked railway companies to furnish a statement of the number of passenger cars they have, heated by stoves, and to what service assigned.

Automatic Signals on the Hudson Valley Railway.

By G. W. Davison, Superintendent of Line Construction.

The Hudson Valley Ry. at Glens Falls, N.Y., crosses the Hudson River from Main St. by a single track block, which block is used both ways by two local lines, each three times per hour, and one interurban every hour, 14 regular cars therefore passing hourly; the running time through it being 2¼ minutes. Express, line cars, and electric locomotives drawing freight cars pass over the track, all this varied traffic on the block being protected by the Nachod Automatic signal type C, made by the Nachod Signal Co. of Philadelphia. These signals are located at the end of the single track block, and operate through a single line wire by the passage of cars under trolley contactors. The power to actuate the signals is derived from the trolley circuit, and no insulated rail joints or other disturbance to the track is required. Fig. 1 is a view of the signal at the north end of the block, neatly mounted on a bracket attached by pole bands to a tubular iron pole. The signals are normally neutral, showing neither lights nor discs. When a car runs under the contactor to take the block, the opposing signal at the other end of the block is set at stop, a red light and a red disc, and the signal in sight of the motorman changes to permissive, a white light and a white disc, as an evidence of

Fig. 2. Trolley Contactors, Hudson Valley Railway Automatic Signal System.

this. An opposing movement to the car in the block is thereby prevented, but following movements are permitted. Should another car enter the block before the first has left, warning of the presence of the first car will previously have been given by the permissive signal. When the first car leaves the block, the signals will not be changed, but will be held until the second leaves also. Fifteen cars, if desired, may thus occupy this block under signal protection. The arrangement is such that the second car if desired, might have backed out of the block without passing through the same, such an operation as might be caused by the line car following the regular car.

The trolley contactors are hung on the wire at the double track ends. The flexible contact strips, opening them somewhat and diverting a temporary current from them to the relay, thereby causing a change of signal indication. Fig. 2 shows them installed at Glens Falls. These contactors are without moving parts, operate at high speed, and require no maintenance. They are hung at one end only on the span wire, thus being free from any line stress, and are attached to the trolley wire by the usual ears. They are connected by vertical leads from two span wires across the street, and considerably higher than the trolley wire, so that, should the wheel fly off, it cannot cut the connections.

The relay in the signal, including both coils and contacts, is immersed in a tank of transformer oil, the high insulation of which prevents lightning troubles, cools the coils, protects the electrical

contacts, and in general conduces to extremely low maintenance.

Access is most conveniently had to the signal relay when necessary, by lowering the entire signal box to the ground without disconnecting the leads. By taking out three bolts, and drawing up on the block and tackle, the hood and relay may be raised for repair or inspection, leaving the oil tank on the ground.

The British Columbia Electric Ry. Co.'s Franchises.

The negotiations initiated by the Vancouver Board of Trade with the company in respect to its differences with the various municipalities spoken of as Greater Vancouver, are reported to have made considerable progress. It is desired

Fig. 1. Automatic Signal on the Hudson Valley Railway.

to bring about an extension of the boundaries of the city of Vancouver so as to include a number of outside municipalities, and as the company has franchises in most of them, with varying terms to run, an endeavor was made to secure a surrender of these, and the framing of a new charter to cover the whole area. The discussion to this end became complicated by legal proceedings in connection with some of the franchises, and the stopping of services on the lines in consequence. On the breaking off of negotiations so far as the Vancouver city council was concerned, the business men took the matter up, with the result that a modus vivendi is likely to be arrived at. The matter is now before the directors in London, Eng., and R. H. Sperling, General Manager, left Vancouver Aug. 8, to discuss the various matters with them.

The Montreal Tramways Co. is reported to be building, at its shops, two cars for the conveyance of prisoners between the courts and the jail. The cars, it is stated, will be built entirely of steel, and completely closed in, being largely an adaptation of the present style of prison van as an electric car. The cars, which will be the Government's property, will be in charge of a motorman and conductor of the company, and there will be two guards in attendance. A special switch is to be built at the court house, and also at the jail at Bordeaux.

Electric Railway Finance, Meetings, Etc.

Berlin and Waterloo St. Ry.—Profits on operation for July, \$2,135.03. Number of passengers carried, 96,511, an increase of 28% over July, 1911.

British Columbia Electric Ry., Vancouver Power Co.—Gross earnings for June, \$498,306; operating expenses \$317,840; net operating earnings \$180,466; renewal funds \$37,935; net earnings \$142,531; approximate income from investments, \$25,000; net income \$167,531, against \$387,664 gross earnings; \$252,819 operating expenses; \$134,845 net operating earnings; \$29,770 renewal funds; \$105,075 net earnings; \$20,000 approximate income from investments; \$125,075 net income for June 1911. Aggregate gross earnings for 12 months ended June 30, \$5,749,649; net earnings \$2,004,631, against \$4,226,834 aggregate gross earnings; \$1,589,784 net earnings for same period 1910-11.

Calgary Municipal Ry.—Passenger earnings for July, \$57,770.20; miscellaneous earnings, \$1,007.90; total earnings, \$58,778.10; operating expenses, \$33,725.36; net operating earnings, \$25,052.74; contingent account, interest, etc., \$8,202.23; net profit, \$16,850.51, against \$38,301.90 passenger earnings; \$845.85 miscellaneous earnings; \$39,147.75 total earnings; \$15,187.22 operating expenses, \$23,960.53 net operating earnings; \$7,220.71 contingent account, interest, etc.; \$16,739.82 net profit for July, 1911.

Cape Breton Electric Co.—Gross earnings for June, \$29,448.22; operating expenses and taxes \$16,791.57; net earnings \$12,656.65; interest charges \$4,495.84; balance \$8,160.81; sinking and improvement funds \$1,206.67; balance for reserves, etc., \$6,954.14, against \$27,426.61 gross earnings; \$15,538.20 operating expenses and taxes; \$11,888.41 net earnings; \$4,512.50 interest charges; \$7,375.91 balance; \$1,131.66 sinking and improvement funds; \$6,244.25 balance for reserves, etc. The construction charges during June, were \$1,544.17.

Halifax Electric Tramway.—Railway receipts for June, \$21,435.18; July, \$24,563.81, against \$19,498.63 for June, and \$23,821.28 for July, 1911.

Hamilton St. Ry.—Gross receipts for quarter ended June 30, \$134,567.27, against \$111,285.40 for same period, 1911. City percentage of earnings, \$10,765.38, against \$8,902.84 for same period, 1911.

Quebec Ry. Light, Heat and Power Co.—A press report from Quebec states that the report for the financial year, recently closed, which will be issued shortly, will show gross earnings of \$1,565,000, compared with \$1,280,126 for the previous year; also that the operating expenses will show an increase, from \$661,907 to \$733,000, and the net earnings, from \$618,219 to \$832,000.

Toronto Ry., Toronto and York Radial Ry., Toronto Power Co., Etc.—Gross earnings for June, \$696,980; working expenses, maintenance, etc., \$357,365; net earnings \$339,615, against \$634,275 gross earnings; \$300,351 working expenses, maintenance, etc.; \$333,924 net earnings, for June 1911. Aggregate gross earnings for six months ended June 30, \$4,012,718; net earnings \$2,036,072 against \$3,568,293 aggregate gross earnings; \$1,805,205 net earnings from same period 1911.

Winnipeg Electric Ry.—Gross earnings for June, \$300,402; working expenses \$150,090; net earnings \$150,312, against \$305,353 gross earnings; \$141,251 working expenses; \$164,102 net earnings, for June 1911. Aggregate gross earnings for six months ended June 30, \$1,808,703; net earnings \$841,129, against \$1,881,605 aggregate gross earnings; \$925,550 net earnings, for same period 1911.

The Halifax Electric Tramway Co. has ordered four box cars from the Nova Scotia Car Works, for delivery in the fall.

Electric Railway Notes.

The Manitoba Public Utilities Commission has under the provisions of section 42 of the Public Utilities Act of 1912, issued the rules of practice to be observed in all proceedings before it.

G. R. G. Conway, Chief Engineer, British Columbia Electric Ry., is also acting General Manager during R. H. Sperling's absence in England, which will probably continue until towards the end of this year.

We are officially advised that the position of manager of the Transportation and Sales Departments, British Columbia Electric Ry., Vancouver, left vacant by the recent resignation of Jas. Roosevelt, has not been filled.

M. J. Kennedy, General Freight Agent, Montreal Tramways Co., has resigned, intending to devote his time to the Montreal Tunnel Co., in which he is associated with D. McDonald, ex-General Manager, Montreal Tramways Co.

It is reported from Winnipeg that the Winnipeg Electric Ry. has selected R. S. Kelsch M., Can. Soc. C. E., of Montreal, as its expert to adjust matters with the Winnipeg city council, in connection with the joint use of poles, etc.

During June, one employe was killed, and five were injured in the course of their work in connection with Canadian electric railways. The fatality was due to the conductor being pulled from his car, his clothing having caught in a wire fence.

The Lethbridge Municipal Ry. has received five double truck city cars from the Preston Car and Coach Co. They are mounted on 27-G-1 trucks, with Westinghouse 101 B.2 motors, for single end operation, with pay-as-you-enter vestibule on rear end.

H. E. Smith comptroller Montreal Tramway Co., has been elected a director of the Efficiency Society of New York, an organization for promoting efficiency in commercial, financial and industrial enterprises of all kinds, including public service corporations.

W. D. Power, heretofore freight expert for the Vancouver board of trade, has been appointed general freight and passenger agent, British Columbia Electric Ry., in charge of all freight and passenger tariffs, preparation of cases for the Board of Railway Commission, etc.

D. McDonald, on retiring recently from the position of General Manager of the Montreal Tramways Co., addressed a letter to the company's officials and employes in which he thanked them for the way in which they had co-operated with him in his many years of service with the company.

J. B. Ingersoll, heretofore Electrical Engineer, British Columbia Electric Ry., Vancouver, who recently resigned, as mentioned in our last issue, has assumed his new duties in charge of the work of the Kootenai Power and Construction Co., in installing a 40,000 h.p. plant at Kootenai Falls, Idaho.

The Berlin and Waterloo St. Ry., which is owned by the city of Berlin, Ont., has decided to provide new uniforms for its employes, and has adopted the following increased scale of wages:—First six months, 16c. an hour; second six months, 17c. an hour; second year, 17½c. an hour; third year, 19½c. an hour; fourth year, 20½c. an hour.

The Quebec Railway, Light and Power Co. has, according to press reports, increased its conductors' and motormen's pay. It is said that employes with eight years service to their credit will receive one cent increase an hour, and those in the service twelve years two cents an hour. Other demands made by the men were not considered.

The Guelph Radial Ry. has ordered a snow sweeper from the Preston Car and Coach Co. It will be of the single truck type, with double end operation, with 33 ins. brooms. The motor equipment will consist of two Westinghouse 101B2 motors with K10 controllers, and one 101B motor with K10 controller to operate the brooms. It will be delivered about the middle of October.

Arthur Reid, General Superintendent of light, power and the street railway of Lethbridge, Alta., returned from Boston, Mass., recently, where he had been attending the American Institute of Electrical Engineers' convention. Press reports stated that he was also on a tour for the inspection and purchase of additional street railway equipment and machinery, but we are officially advised that the city is not, at present, in the market for such.

The Galt, Preston and Hespeler St. Ry. has received two double truck inter-urban cars, from the Preston Car and Coach Co. They are mounted on Baldwin trucks, with steel tired wheels, and equipped with Westinghouse 93A motors,

P297 F. D. Burpee,
Superintendent and Purchasing Agent,
Ottawa Electric Ry., Ottawa.

multiple unit control, Westinghouse AMM air brakes, and steel underframes. The interior finish of the passenger compartment is inlaid mahogany, and of the smoking compartment, quartered oak, empire finish throughout, with arc lamps.

D. Miller, Superintendent, Hamilton Street Ry., was charged in the Hamilton, Ont., police court, Aug. 2, on complaint of R. McNeil, a former employe, with violating sec. 3 of the Ontario Act which regulates the hours which street railway motormen and conductors shall work. The charge was withdrawn, as it had been ascertained that no action could be taken by a private individual under the Act unless the consent of the Ontario Railway and Municipal Board had previously been obtained.

H. Weeks, a passenger on one of the Halifax Electric Tramway Co.'s cars, was fined \$15 and costs, recently, for using abusive language to a conductor for not giving him a transfer as speedily as desired. On behalf of the company, it was stated that the man had been abusive to other conductors, and the company intended to take action in all similar cases,

as the conductors were placed in such a position that they could not resent the treatment except by bringing the offenders before the court.

J. E. Hutcheson, before leaving Ottawa recently to assume the General Managership of the Montreal Tramways Co., was entertained by his fellow members of the Laurentian Club and presented with a very handsome gold mounted clock and a silver model of an electric car. The function was attended by a large number of Ottawa's principal citizens, and all the speakers highly eulogized the recipient. The Ottawa Electric Railway Co.'s directors adopted a resolution expressing their appreciation of Mr. Hutcheson's great services to the company, and presented him with a cheque for a substantial amount.

The Registrar of Joint Stock Companies for British Columbia has given notice under sub-sec. 3, sec. 268 of the Companies Act that the following companies have been struck off the register, but are given one month from July 25 to obtain re-registration if necessary:—Vancouver Electric Ry. and Light Co., Vancouver and Lulu Island Electrical Ry. and Improvement Co., registered under the Act of 1878; The National Electric Tramway and Lighting Co.; Chilliwack Tramway Co.; Vancouver and Westminster Electric Tramway and Light Co., registered under the Act of 1890; Nelson Electric Tramway Co., registered under the Companies Act of 1897.

The British Columbia Electric Ry. recently gave its employes, with their families, a two-days' picnic at Hastings Park, Vancouver. Over 6,000 persons were the guests, the company providing all the entertainment, including a programme of sports. R. H. Sperling, General Manager, presented a perpetual challenge cup for a tug of war, and the Conway perpetual challenge cup for line-men was well contested for. The test consisted of the climbing of a 45-ft. pole, going over the arm, returning to the ground, and repeating the performance at another similar pole 30 ft. away. The contest was won by the New Westminster team, one of its members performing the feat in 52.5 secs., creating a new record on the coast.

Double Deck Electric Railway Car.—

The New York Railways Co. is experimenting with a double deck car on its street railways. The car, which has been made from special designs, is 44 ft. 10 ins. long and 8 ft. 3 ins. wide, with the upper deck shorter than the lower one. The entrance is in the middle at the side of the car, and the floor of the lower deck is about 10 ins. above the pavement. The stairways to the upper deck are inside the car at each end, and the upper seats are arranged in two rows longitudinally, back to back. The car has seating capacity for 88 passengers and a maximum capacity for 171 passengers. The weight of the car per seated passenger is given as less than 500 lbs. The head room on the lower deck is for the most part, 7½ ft., and for the upper deck, 6 ft. 1 in. The car is equipped with an air brake and provision is made for increasing the brake power in proportion to the weight of the car load. The doors are opened and closed by compressed air, the arrangement being controlled by a foot lever next the seat occupied by the conductor, opposite the entrance to the car, where he sits to take fares. We are given to understand that Canadian street railways are not much interested in the matter, as it is believed that such cars are not suitable for city operation.

Nipissing Central Ry.—Tracklaying and ballasting is reported to be well advanced on the extension of the line from Haileybury to New Liskeard, Ont. It is expected that the extension will be fully completed and in operation by Oct. 1.

Calgary Municipal Railway.

The report of the Calgary Municipal Ry. operations for the year ended June 30, shows—

Gross earnings \$479,240.24
Operating expenses 282,600.56

Net operating earnings \$196,639.68
Taxes, (real property) \$ 2,264.18
Interest 45,000.00
Sinking fund 18,160.00
Contingent fund, 5% of gross revenue 23,962.01 89,386.19

Net profits \$107,253.49

The operating expenses include—Way and structures, \$9,946.12; equipment, \$44,934.14; transportation, purchased power, \$74,272.72; operation of cars, \$136,404.27; general expenses, \$17,043.31. The proportion of operating expenses to revenue, was 59.44%. Amount paid to employees, in wages, \$172,251.75. The value of the property is given in the report, in detail, as follows:—

Engineering \$ 4,055.40
Track construction 901,622.29
Line construction 94,561.77
Buildings 24,317.85
Shop tools and machinery 2,146.65
Cars 205,431.15
Electric equipment 59,318.50
Miscellaneous 639.56

\$1,292,082.17

The following statistical information is also given:—car miles 1,643,328; car hours, 195,206; passengers carried, 11,578,130; transfers, 1,262,400; total passengers carried, 12,941,530; average fare, 4.076c.; average fare, including transfers, 3.615c.; car earnings per car mile, 28.722c.; miscellaneous earnings per car mile, 0.440c.; gross earnings per car mile, 29.162c.; car earnings per car hour, \$2.41; gross earnings per car hour, \$2.45; miscellaneous earnings per car hour, 0.04c.; operating expenses per car mile, 17.196c.; operating expenses per car hour, \$1.44.

The total length of road, computed as single track, is 53 miles, made up as follows:—First main track 42 miles, second main track 10 miles, sidings and turn-outs one mile. There are 49 passenger cars owned, 48 of which are closed; four work cars, and two sprinklers.

During the year one passenger was injured, and three persons were killed in accidents.

Killing Weeds with Water Gas Tar.

The Conestoga Traction Company, of Lancaster, Pa., has 162 miles of track, covering the city and practically the whole of Lancaster county. It has been found that sprinkling with water tar is effective in laying dust, as well as entirely removing weeds, and is believed to have additional value in preserving ties. The cost of the treatment is stated to be \$60 to \$65 a mile, about 3,000 gals. of tar being required per mile, and the cost of the tar being 2 cents a gallon at the holder. Tank cars, holding 1,000 gals., are used, built by placing a tank 4 ft. in diameter and 15 ft. long on an old truck. The sprinkler consists of a 2 in. iron pipe, the length of a tie, capped at the ends and attached to the tank by two adjustable rods, permitting raising and lowering. A hose attachment to the tank outlet gives flexibility. Three rows of staggered 3/16 in. holes are bored in the sprinkler, except over the rails, where blank spaces are left to prevent tar from getting on the rails. A 2 in. wire flue brush on a 3/4 in. pipe is run through the sprinkler occasionally to clear out dirt which collects on it. It is expected that one application of the tar to the roadway will last two years. The tar carries a slight odor of gas, it is stated, which soon disappears.

MISS S. E. STORY, eldest daughter of D. A. Story, General Freight Agent, Intercolonial Ry., Moncton, N.B., was married in Toronto, Aug. 26, to C. S. Clark, of Moncton.

National Steel Car Company Limited.

This company has been incorporated under the Dominion Companies Act, as stated in Canadian Railway and Marine World for August. Following are extracts from the prospectus issued in connection with the sale of stock.

The capitalization is \$3,000,000 of 7 per cent cumulative preference stock, of which \$1,500,000 is being issued now and \$3,000,000 of common stock, of which \$2,000,000 is being issued. The preference stock is being sold to the public at 98, with a bonus of 60 per cent. of common stock. The directors are Sir John Gibson, Lieutenant-Governor of Ontario; J. J. Scott, K.C.; and W. Southam, Hamilton, Ont. Sir Henry Pellatt, Toronto; C. H. Cahon, K.C.; Mortimer Davis, W. G. Ross, Montreal; W. W. Brice, W. B. Parsons, M. H. Coggeshall, New York; Basil Magor, President, Magor Car Co., Passaic, N.J. The head office is in Montreal and the plant is to be built in Hamilton, Ont.

It is pointed out that the present car building facilities in Canada are inadequate to supply the railways' growing demands, and that existing plants are behind in their orders and that a large number of cars are of necessity imported from the United States despite the heavy customs duty.

As a large portion of the materials used in building freight cars are of necessity imported from Pittsburgh and the Mississippi Valley, Hamilton was selected as the best point for manufacturing and it is claimed that the saving in freight, over any other point considered, should, when the plant is working to 60 per cent. capacity, equal three-quarters of the preferred dividend.

The plant, which has been designed by Barclay, Parsons and Klapp, New York, will have a large ultimate capacity, property has been bought and construction has been started on the first portion which will have a full capacity of 30 cars a day. The cost of the plant is estimated as follows:—Buildings, \$261,230; machinery, \$204,500; property, \$100,000; contingencies and engineering, \$84,000; total, \$649,730.

Based upon the earnings of the car plants in Canada and the U. S., and the actual earnings of the Magor Car Co., of Passaic, N.J., in particular, and without taking into consideration the advantageous location of the new plant, the following estimated earnings in the average year are submitted by the management for a capacity of 30 cars per day or 9,000 a year. Average operation 60% of capacity, 5,400 cars average profit of 8% net on gross business, \$400,000. 7% preference stock dividend, \$105,000. Available for common dividend, \$295,000. Or 14 2/3% on common stock.

In 1908, previous to the consolidation, the Canada Car Co., with a daily capacity of 25 cars, showed earnings of over \$445,000, and the Dominion Car and Foundry Co., with a capacity of 30 cars, earned over \$414,000. A careful study of the earnings of car plants in Canada and the U. S. for a period of years, would indicate that the estimate of \$400,000 in the average year is conservative. In order to cover the preferred dividend it will be necessary for the new company to earn but slightly more than a quarter of this amount, which is well within the minimum earnings which the management anticipates even in years of serious depression.

The Magor Car Co. for 11 months ended March 31, showed a trading profit of 37% for the full year as the actual fit of 37% for the full year on the actual was one of depression in the car business in the U.S. with very keen competition.

The company will be managed by Basil Magor, who is resigning the presidency of the Magor Car Co., believing in the greater possibilities for business in

Canada. His former superintendent at Passaic will be associated with him. A. Butze, formerly General Purchasing Agent, Grand Trunk and Grand Trunk Pacific railways, has been appointed Assistant Secretary and Purchasing Agent.

Among the Express Companies.

J. B. Dickey has been appointed agent, Dominion Ex. Co., Revelstoke, B.C., vice J. L. Stark.

D. Doody has been appointed route agent, Dominion Ex. Co., with headquarters at Montreal.

H. J. Berry has been appointed agent, Canadian Northern Ex. Co., Emerson, Man., vice R. D. Carlow.

J. W. Herbert has been appointed agent, Canadian Northern Ex. Co., Regina, Sask., vice W. A. Best, transferred.

Z. M. Middleton has been appointed chief clerk to Superintendent, Canadian Northern Ex. Co., Winnipeg, vice G. S. Jackson, promoted.

The Canadian Northern Ex. Co. has opened offices at Antar, Briercrest, Mistatim and Waseca, Sask., and Athabasca Landing and Clyde, Alta.

G. S. Jackson, heretofore chief clerk to Superintendent, Canadian Northern Ex. Co., Winnipeg, has been appointed route agent, Winnipeg, vice W. F. Pillar, transferred to Edmonton, Alta.

E. M. English, heretofore financial agent, American Ex. Co., Montreal, has been appointed Assistant Manager of the company's Eastern Financial Department, New York, and A. B. Howard has been appointed financial agent at Montreal, to succeed him.

C. A. Roach, who was recently appointed route agent, Canadian Ex. Co., Montreal, was entertained to dinner and presented with a club bag, by a number of his friends and associates at Cornwall, Ont., Aug. 13, on his leaving the company's local office for Montreal.

The Canadian Ex. Co. has opened offices at Birch, Wyebridge and Picton, Ont., and has extended its service to the steamboat line between Napanee and Picton, Ont., and on the Grand Trunk Pacific Ry. to Mirton, 56 miles west of Edson, Alta. Offices will be opened at Bickedike and Makanum.

The British Columbia Express Co. recently made an offer to purchase the old stage coach Stampede, but the owners are expecting to realize a high price for the coach as a relic than the company is willing to give for it for ordinary use. In these days of steam and electric railways it is interesting to know that this company has in operation over 30 stage coaches carrying mail and express matter through central British Columbia and right up to the Cariboo district.

C.P.R. Scholarships at McGill University.—Two of the scholarships which the C.P.R. offers for employees under 21 years of age, and for minor sons of employees, recently became vacant. One has been secured by E. A. Leslie, son of J. Leslie, Assistant Comptroller, and the other by W. J. Shrimpton, son of F. E. Shrimpton, Auditor of Disbursements.

Prior to the adjournment of the British House of Commons, Aug. 7, the Postmaster General announced that the Government contract with the Marconi Wireless Telegraph Co. provided that the Government supply \$3,000,000 for the erection of five wireless stations, Australia supplying \$500,000 for one station, thus forming a wireless telegraph circuit round the world. He also stated that the Government was unable to undertake the construction itself, and the company named was the only one with the necessary experience and plant to carry out the scheme.

Marine Department

The Thousand Island Steamboat Co.'s New Vessel.

The steamboat Thousand Islander, which was delivered to the Thousand Island Steamboat Co. in July, and which has been taken over by the Richelieu and Ontario Navigation Co., with the rest of the T.I.S.B. Co.'s fleet, has the following dimensions:—

Length over all, 172 ft. 9 ins.; beam moulded, 32 ft.; depth moulded, 9 ft. 6 ins.; gross tonnage, 355; net tonnage, 241.

She is of the tunnel stern, shallow draught, twin screw type, and consists of main, promenade and boat decks. There is life saving equipment for 1,000 passengers, included in which are three 18 ft. life boats and one 14 ft. working boat. All decks, cabins, etc., above the main deck are constructed of wood, and the part below the main deck is of steel.

The hold is arranged for chain locker, crews quarters and power plant. From frame 1 to 16 there is accommodation for four firemen and seven deck hands. There are staterooms from frame 16 to 26 for souvenir boys, mess boy, bartender, cook and assistant, two waiters, oiler, watchmen and steward. The two boilers and engines, together with the auxiliaries, take up the space from frame 26 to 55. The space from frame 55 to 66 is occupied by 14 people, including the chief engineer, assistant engineer and electrician. All berths are of metal, and the quarters are finished in redwood.

On the main deck a hand capstan windlass occupies the space as far aft as frame 7. From frame 7 to 12 space is taken up by the mens' toilet, which is finished in redwood. The bar room is finished in chestnut and leads as far aft as frame 19. Access to the toilet and bar room is maintained by a 3 ft. passage extending along the port side of the ship forward from frame 19 and terminating in the windlass room. This passage is finished in oak. The deck from frame 19 to 43 is clear, with the exception of the boiler casing, which is 14 ft. wide and extends from frame 26 aft to 44. The upper part of the boiler casing forward is cut away to make room for the stairs leading from the promenade to the main deck. The forward gangways extend on each side of the ship from frame 22 to 25. This part of the ship is finished in oak. The ship is coated through five 20 in. scuttles, placed between frames 26 and 42. The starboard side of the ship from frame 43 to 54 is taken up by the galley, which extends from the ship's side to the engine hatch coaming. A passage is left between the galley and boiler casing to connect with an athwartship passage between the forward engine hatch coaming and the after boiler casing, making a clear passage from port to starboard 42 ins. wide. This passage in turn connects with a fore and aft passage on the port side leading from the main deck amidships to the social hall aft. The ladies' lavatory on the port side, extending from frame 43 to 56, communicates with this passage. The engine hatch is 13 ft. wide and extends from frame 46 aft to 54. The social hall extending from frame 54 to 62, includes the stairs leading from the main to the promenade deck, while gangways take up the space from frame 56 to 59. The breakfast room, extending from frame 62 aft to the stern includes the linen room on the starboard side and the purser's room on the port. The breakfast room is finished in quartered oak and contains 20 tables with redwood tops. The purser's room, linen room, galley and ladies' lavatory are finished in redwood, while the social hall is finished in mahogany.

The promenade deck extends from stem to stern and is clear but for a closed cabin 19 ft. wide which extends from frame 19 to 62. The forward end of this cabin contains the stairs leading to the main deck, while a stack casing 7½ ft. wide extends from frame 31 to 41. The after end of the cabin is taken up by a stairs leading to the social hall on the main deck and by a souvenir counter placed in the extreme end. The deck is supported amidships by the boiler casing, which in turn, is given additional strength. Forward and aft of the boiler casing I beam stringers, in connection with gas pipe stanchions, are used in giving support to the deck, while the space between the promenade and main deck is built up of wood. The deck itself is of ¾ in. pine, covered with canvas and supported by 4¾ x 1½ in. pine beams, spaced 24 ins. centre to centre. The deck is enclosed by an oak rail 1 ¾ x 5 ins., supported at equal intervals by oak stanchions, the whole being enclosed by galvanized wire iron work. Window stools and sashes of cabin windows are of mahogany, the cabin exterior is finished in

THE STEEL HULL.—The hull is divided into six compartments by transverse bulkheads, three being watertight and two non-watertight. The peak bulkhead at frame 6 is made up of 10 lb. plate, stiffened in a vertical direction by 3½ x 2½ x 6.1 lb. angles and in a horizontal direction by 2½ x 2½ x 4.1 lb. angles. The plating of watertight bulkheads at 26 and 66 runs from 12½ lbs. per sq. ft. below to 6 lbs. above. Horizontal and vertical stiffeners are all 2½ x 2½ x 4.1 lbs. The bulkhead at frame 44 is non-watertight and separates the boiler from the engine space. It is built up of 6 lb. plate stiffened vertically by 2½ x 2½ x 4.1 lb. angles and horizontally by 3½ x 2½ x 7.2 lb. angles. The engine space is separated from the after hold by a non-watertight bulkhead at frame 55; it is built up of 14 b.w.g. plate and stiffened vertically and horizontally by 2½ x 2½ x 4.1 lb. Double angles are used in connecting the watertight bulkheads to the shell, while single angles are used for those that are non-watertight. Diamond shaped liners are fitted to all bulkheads in way of outside strakes of plating. There are two coal

The Thousand Island Steamboat Co.'s Steamboat, Thousand Islander.

redwood and the interior in white pine covered with white enamel. The souvenir stand is of mahogany, together with the newell posts of stairways and the wood finish around the pipe stanchions.

The boat deck extends from frame 17 aft to the extreme stern. The deck forward carries the usual pilot house and chart room, together with accommodations for the captain, owner, maid and mate. The stack casing, 7½ ft. wide, extends from frame 31 to 41. Aft of frame 42 there are four life boats. The stairs leading to the promenade deck are located between frames 72 and 75. The entire deck is enclosed by a ¾ in. pipe railing about 2 ft. 9 ins. above the deck, supported by ¾ in. pipe stanchions placed at 5 ft. intervals. The support for the deck is arranged in the same manner as the promenade deck. The deck is of ¾ in. pine, covered with canvas. The beams are of pine, 1¾ x 4¾, spaced 25 ins. centre to centre, the camber being 6½ in. in 32 ft. The Texas is finished in redwood and the sash for the windows is mahogany.

bunkers placed on opposite sides of the ship and having doors that open into the fire hold. The starboard bunker extends from frame 36 to 44 and the port bunker from 26 to 35. The bunkers are built up of 6 lb. plate stiffened vertically by 2½ x 2½ x 4.1 lb. angles spaced 24 ins. keel to keel. The boiler casing consists of 6 lb. flanged plate built up from 10 lb. coamings. The plates are flanged the necessary depth to do away with the angle stiffeners. The shell plating includes the garboard strake of 11 lbs. fore and aft, bilge and bottom plate 10 lb. fore and aft. Strake next below the sheer strake 11 lbs. fore and aft, while the sheer strake is 12 lbs. for ¾ length amidships reduced to 11 lbs. at the ends. The keel plate is flat, being 30 ins. wide by 15 lbs. fore and aft, and worked in lengths of not less than seven frames spaces. The butts are double riveted; a single inside 13 lb. strap being fitted extending to the garboard edge laps. The garboard bottom and bilge strakes are butt lapped, double riveted, with ¾ in. rivets. The side and sheer strakes are butt lapped, double

rivetted with $\frac{3}{4}$ in. rivets. The fore and aft edge laps of the garboard and sheer strakes are double rivetted, the remainder are single rivetted. The under body of the boat is sheathed with rock elm, $2\frac{1}{2}$ ins. thick. The sheathing extends from between frames 15 and 16 to frames 66 and 67 and extends upward to the turn of the bilge. After the shell plating had been caulked, the wood sheathing was fastened in place by means of bolts and nuts and the bottom was then caulked in the usual manner. The floors, 12 ins. deep, are solid on every frame, being formed of 10 lb. plates, with the exception of the engine and boiler space, where they are increased to 14 lbs. Deep floors are provided for the engine space and also for the ends of the ship. The frames are formed of $3 \times 2\frac{1}{2} \times 4.5$ lb. angles and spaced 24 ins. keel to keel. The reverse frames forward and aft of the engine and boiler space are $2\frac{1}{2} \times 2\frac{1}{2} \times 4.1$ lb. angles extending alternately to the main deck stringer plate and to the upper turn of the bilge. In the engine and boiler space they are increased to 5 lb., and all extend to the main deck stringer plate, while additional reverse frames are fitted for the length of the floors.

There are two longitudinal keelsons on each side of the centre line, worked intercostal between solid floors on each frame. The longitudinals are formed of 10 lb. vertical plates, the lower edges being flanged and rivetted to the shell, while the top edges are rivetted to a 6 in. $\times$ 10.5 lb. channel, which extends fore and aft over the tops of the floors to which it is attached by angle clips.

The channels are continuous fore and aft, and are not cut in the way of bulkheads. Bracket connections are made at all the bulkheads besides the necessary watertight construction. The longitudinals are carried as far forward as practicable and as far aft as the stern, where they help to stiffen the roof of the tunnel.

The bilge and side stringers are formed of a 6 in. $\times$ 10.5 lb. channel, connected to the frames by $2\frac{1}{2} \times 2\frac{1}{2} \times 4.1$ lb. clips. The channels are slotted in way of the frames and cut at the bulkheads to which they are attached by suitable brackets. The outer flange of the channel is connected directly to the shell, while the channel itself is fastened to the frames by angle clips. At the stem the stringers are connected by 10 lb. plate breast hooks together with the necessary angles.

The foundation for the engines is formed mainly of four longitudinal girder plates each of 10 lb. intercostal, between the floors, to which they are attached by means of double angles $2\frac{1}{2} \times 2\frac{1}{2} \times 4.1$ lbs. The girder plate itself extends to the shell to which it is connected thereto. The rider plates are continuous and formed of 20 lb. plates, 15 $\frac{1}{2}$ ins. wide connected to the floor plates and longitudinals, thereby tying the whole together.

There are two saddles for each boiler, consisting of 14 lb. plate and double angles $3 \times 3 \times 7.2$ lbs. The fore and aft saddles for each boiler are connected by 14 lb. plate girders to which they are connected by $2\frac{1}{2} \times 2\frac{1}{2} \times 5$ lb. angles.

The main decks beams are of angle steel $5 \times 3 \times 8.2$ lbs. placed on every frame to which they are connected by 10 lb. gusset plates 15×15 ins. The camber is 6 ins. in 32 ft. The main deck stringer plates are 18 ins. $\times$ 10 lbs. for two thirds length amidships reduced to 8 lbs. at the ends. They are fitted close to the sheer strake plating and connected thereto by a 6 in. $\times$ 14.52 lb. Z bar. The top edge of the sheer strake is flanged outward to receive the lower flange of the Z bar while the deck stringer is connected to the upper flange of the bar.

The only plating on the main deck, other than that of the main deck stringer, is that due to the reinforcement of hatch openings in the way of boiler and engine

space and stairways. The main deck is of pitch pine $2\frac{1}{4}$ l.s. thick $\times$ $3\frac{3}{4}$ ins. wide, laid in long lengths, and well fastened to the beams and plating by $\frac{1}{2}$ in. diar. cheese head, square necked, galvanized bolts and nuts. An oak fender, strake 6×8 ins. is placed on a line with the main deck and extends around the stern to as far forward as the stem.

THE MACHINERY.—There are two main engines of the two cylinder, vertical, direct acting compound type, well balanced and each capable of developing about 500 h.p. at 200 revolutions a minute, from a steam pressure of 150 lbs. per square inch.

The sequence of cylinders, beginning forward, is high pressure and low pressure, with diameters, respectively, 15 and 30 ins. and a common stroke of 20 ins.

The main engines are placed 8 ft. apart in a single engine room without a centre line bulkhead, the starting platform being conveniently located between the engines, with ample space for the engine crew to work. The cylinders are fitted with safety valves in the bottom and covers. From the centre of the engines to the centre of propeller is 62 $\frac{1}{2}$ ft.

The cranks are set at 90 degrees. The high pressure cylinder has one piston valve 9 ft. in diar., while the low pressure cylinder has a flat, double ported slide valve 28 ins. wide and 24 ins. long, the valve travel in each case being 4 $\frac{1}{2}$ ins.

The valves are operated by Stephenson's link motion, through overhung double bar links, with motion derived from eccentrics keyed to the crank shaft. The valve gear is so adjusted that the mean cut-off in full gear will be about 66 $\frac{2}{3}$ % in the high pressure cylinder, and 56 $\frac{2}{3}$ % in the low pressure cylinder. The point of cut-off will be variable by means of slotted reverse arms. The pins on the links for the attachment of the eccentric rods are 24 $\frac{1}{4}$ ins. centre to centre, the full throw of the links being 12 ins.

The high pressure eccentric sheaves are of cast iron and made in one piece, while the low pressure sheaves are made in halves. The straps for all the eccentrics are of cast iron and made in halves, the bearing surface in each being 2 $\frac{1}{2}$ in. wide. The distance from the centre of the shaft to the centre of the links is 50 $\frac{1}{2}$ ins.

The valve stems in all cases are 1 $\frac{1}{2}$ ins. diar. through the valves, 2 ins. through the stuffing boxes and 2 $\frac{1}{4}$ ins. at the guides. The piston rods are each 3 $\frac{3}{4}$ ins. diar. The framing of each engine consists of two cast iron I section columns at the front and two cast iron box section columns at the back.

The bed plates are of cast iron and contain three bearings each. The exhaust passage from the high to the low pressure cylinder is formed by an 8 in. extra heavy steel pipe, bent to the arc of a circle and connected by flanges to the upper facing of the steam chests.

From the inboard side of each low pressure steam chest a steel exhaust pipe leads to a cast iron fitting bolted directly to the condenser, which is common for both engines. Each exhaust pipe is of 11 ins. diar. at the cylinder and 12 ins. at the condenser.

The high pressure pistons are of cast iron, fitted with cast iron plugs arranged for water grooves. The low pressure pistons are of cast steel fitted with the usual arrangement of cast iron follower, and two spring rings in each piston. All pistons have a depth of 4 $\frac{1}{2}$ ins.

The crossheads are of cast steel with pins 4 ins. diar. by 5 $\frac{1}{2}$ ins. long. Brass slippers are fitted for both ahead and astern thrusts. The slipper for the ahead thrust is 10 ins. wide by 12 ins. long, while the combined width of the slippers for the astern thrust is ins. with a length of 12 ins.

The crosshead backing guides of L section are made of cast iron and bolted directly to the back columns.

The connecting rods which are 45 ins. centre to centre, having a diameter at the crosshead end of 3 $\frac{1}{4}$ ins., and 3 $\frac{3}{4}$ ins. at the crank end. The crosshead end has a single connection, and the adjustment for wear at that end is taken up by means of a wedge, while at the crank end a bolt connection is used.

The crank shafts are each made in one forging with a coupling disc 14 $\frac{1}{2}$ ins. diar. by 1 $\frac{1}{2}$ ins. thick at one end. The length over all is 7 ft. 1 $\frac{1}{2}$ ins.

The journals are 6 $\frac{3}{4}$ ins. diar., while the crank pins are 6 $\frac{1}{2}$ ins. by 8 ins. long.

The crank webs are 7 $\frac{1}{2}$ ins. wide by 4 $\frac{1}{2}$ ins. thick. Opposite each crank slab a tail piece is forged, to which the cast iron counterbalances are bolted. The counterbalances are of sufficient weight to take care of the reciprocating as well as the rotating weights. Each thrust shaft is 6 $\frac{3}{4}$ ins. diar. and 3 ft. 7 ins. over all, being fitted with four collars 13 ins. diar. by 1 $\frac{1}{2}$ ins. thick and 3 $\frac{1}{2}$ ins. apart. A coupling disc is forged on each end 14 $\frac{1}{2}$ ins. diar. by 1 $\frac{1}{2}$ ins. thick.

There are two intermediate shafts for each engine, 6 $\frac{3}{4}$ ins. diar. by 12 ft. 9 $\frac{1}{4}$ ins. long and coupling discs forged at each end. The tail shaft is 7 $\frac{1}{2}$ ins. diar. in the bearings and 6 $\frac{3}{4}$ ins. diar. between the bearings and at the ends. Length over all is 30 ft. 3 $\frac{5}{16}$ ins. A cast iron coupling disc 18 $\frac{1}{2}$ ins. diar., is shrunk on the forward end.

Each crank shaft has three bearings, 6 $\frac{3}{4}$ ins. diar., two being 8 ins. long and one 11 $\frac{1}{4}$ ins. The thrust bearings consist of cast iron pedestals, fitted with three cast iron horse shoe collars lined with white metal in each pedestal.

The intermediate shafting for each engine is carried by two spring bearings made of cast iron, the lower halves being lined with white metal.

Each propeller shaft is supported at the outboard strut and also in the stern tube by a bearing at each end. The bearing in the strut consists of a brass sleeve 22 ins. long, carrying wood strips of lignum vitae. The after bearing in the stern tube is a duplicate of the strut bearing, while the bearing at the inboard end consists of a brass sleeve.

The stern tube is made of two cast iron sleeves connected by a standard steel pipe 9 ins. diar. The after sleeve is made to fit a cast steel boss rivetted to the shell of the ship, while the inboard end is flanged to receive the after collision bulkhead. The over all length of stern tube is 14 ft. 5 ins. There are two propellers of cast iron, solid, three bladed, and made to the right and left hand. The diameter of each wheel is 6 ft., while the pitch is 9 ft. The developed area for one wheel is 14 $\frac{1}{2}$ sq. ft. The propellers rotate outboard.

AUXILIARY MACHINERY.

All auxiliary machinery is placed below the main deck with the exception of the dynamo and hand deck pump, which are placed on the main deck.

REVERSING GEAR.—A steam cylinder 7 ins. diar., and 12 ins. stroke, is used for reversing each engine and is bolted directly to its respective front column. A slide valve of cast iron governs the action of this cylinder.

AIR PUMP AND JET CONDENSER.—A single acting, independent, vertical air pump and jet condenser is fitted, having one steam cylinder, 12 ins. diar., placed directly over the air chamber 24 ins. diar., with a common stroke of 18 ins. The diameter of the injection pipe is 5 ins. while the overboard discharge pipe of the air pump is 10 ins. The air pump is placed athwartship, the centre being 9 ft. 5 ins. aft of the centre of the engine, the base resting upon the ship floors.

THE FEED WATER HEATER is located on the starboard side on the forward engine room bulkhead and uses the auxiliary exhaust steam. It is a film feed water heater consisting of eight spiral corrugated tubes 2 $\frac{3}{4}$ ins. diar. by 46 ins. long.

FEED PUMP.—There is one 10 $\times$ 6 $\frac{1}{2}$ $\times$ 12

independent, simplex, plunger, horizontal feed pump. It is located on the port side of the engine room and has a discharge of 2½ ins. diar., while the suction connects with a 4 in. two valve manifold which draws from the hot well and sea.

GENERAL SERVICE PUMP.—There is one 8 x 5 x 12 independent, duplex, plunger, horizontal general service pump placed on the starboard side of the ship. The suction of this pump is connected to a 4 in. three valve manifold which draws from the sea, bilge and hot well. The discharge 2½ in. diar. is connected to the general service pump manifold, through which the pump discharges indirectly to the ash gun, fire hose, deck hose, engine hose, condenser, overboard, fresh water tanks, to the boilers through the feed water heater and to the boiler direct through independent lines. A 14½ injector discharges into the after end of this manifold.

FRESH WATER PUMP.—There is one 4 x 4½ x 5 independent, duplex, piston, horizontal fresh water pump placed on the starboard side of the ship on the forward engine room bulkhead. The suction and discharge are, respectively, 2 ins. and 1½ ins. The suction and discharge are connected to the fresh water tanks, which are in the boiler room.

SANITARY PUMP.—There is one 5½ x 5 x 5 independent, duplex, piston, horizontal sanitary pump placed on the starboard side of the ship, suction being taken from the sea. The suction and discharge are, respectively, 3 ins. and 2 ins.

BILGE PUMPS.—There are two dependent, horizontal, plunger bilge pumps, 4½ ins. diar. by 4 ins. stroke, each pump deriving its motion from a pin driven into the forward end of the crank shaft. The pump body is bolted to the outboard side of the bed plate of each engine, the suction 3 ins. diar., is connected to the bilge, while the water is discharged through two 2½ in. pipes directly overboard.

STEERING ENGINE.—There is a double cylinder 5 x 5½ steering engine, steam and hand combined, on the port side of the ship, connecting with the rudder quadrant by chains.

DYNAMO.—There is a 25 kilowatt generator direct connected to a steam turbine, which furnishes current for lighting the ship. This outfit is placed on the main deck, starboard side, just aft the engine platform. The switchboard is placed on the port side near the entrance to the engine platform; the whole being within the engine well.

The distribution of lights is as follows:—

BOAT DECK.	MAIN DECK.
10—8 c.p.	57—8 c.p.
5—16 c.p.	45—16 c.p.
4—32 c.p. Signal Lights.	HOLD.
PROMENADE DECK.	37—8 c.p.
76—8 c.p.	36—16 c.p.
8—16 c.p.	

THE FAN AND ENGINE used in connection with the forced draught for the boilers is placed on the port side of the engine room at the forward engine room bulkhead. The 5 x 5 high pressure engine is direct connected to a no. 6 fan. board side of the ship, on the forward side of the coal bunker bulkhead. This gun consists of the hopper into which the ashes are thrown and discharged overboard.

THE ASH GUN is placed at the starboard through a 7 in. extra heavy pipe, check valve and a deflector which is riveted to the side of the ship. A water jet at the top and bottom of the gun furnishes the necessary power to discharge the ashes.

HAND PUMP.—There is one vertical, duplex, plunger hand pump, required by the U.S. laws, placed on the main deck, aft. Each cylinder is 4½ ins. diar. with a stroke of 6 ins. making a total capacity for each cylinder 106 cu. in.

BOILERS.—Two single ended Scotch boilers of the cylindrical type working at a pressure of 150 lbs. to the square inch are located on the centre line of the ship in one boiler room. The dis-

tance between the boilers longitudinally is 9 ft. 9 ins. between the furnace fronts, while each boiler has a separate funnel spaced 12 ft. apart. The funnels are 40 ins. inside diar., while the outside stacks are 48 ins. diar., the top being 40 ft. 3 ins. above the grates. The boiler aft, projects through the bulkhead between the boilers and engines about 3 ins. There is an exit to the main deck at the forward end of the boiler room. Ventilation for the boiler room is provided by two 24 in. ventilators placed in the centre of the boiler room, the outlets being carried down level with the bottom of the air heater.

The furnaces, two in each boiler, have internal and maximum diameters of 45 ins. and 48-16-16 ins. respectively, the thickness being 15/32 in. The grates are 5½ ft. long, the grate surface of each boiler being 41½ sq. ft., while the heating surface in each boiler is 1713 sq. ft., or a ratio of 41.5 to 1; making for the two boilers an aggregate grate surface of 82.5 sq. ft. and a total heating surface of 3426 sq. ft. The furnaces are of the Morison suspension type, and have independent combustion chambers. The length of the tubes between the tube sheets is 6 ft. 10 3/16 ins., and they are spaced 3½ ins. in a vertical and 3½ ins. in a horizontal direction. Each boiler contains 326 tubes, of which 44 are stay tubes; all have an outside diameter of 2½ ins., with 10 gauge for the stay tubes and 12 gauge for the ordinary tubes. The tube sheets have a thickness of 5/8 of an inch. The top of the combustion chamber, which is 9/16 of an inch thick, is supported in the usual manner by bridge girders. The boiler shell is 15/16 in. thick.

FORCED DRAUGHT.—The positive forced draught unit consists of a no. 6 fan direct connected to a 5 x 5 high pressure engine. The suction of the fan is taken from the engine room, while the air is discharged, through a 24 x 24 in. galvanized steel pipe to the air heaters, which are studded to the boiler fronts. The suction of the fan has a diameter of 31½ ins. while the discharge has a sectional area of 576 sq. ins. The air heater for each boiler measures 9 ft. long by 2 ft. 8 ins. wide and 5 ft. 2 ins. deep. Each heater consists of 127 horizontal tubes, whose ends are expanded into steel plate headers, ¼ in. thick. All the tubes are of steel, 2½ ins. outside diar., 14 gauge and 9 ft. long. The total heating surface for both air heaters is 1346 sq. ft. The operation of the positive draught is such that the burnt gases from the boiler pass on the outside of the air heating tubes, while the fresh air for the furnaces is forced through the tubes, thus abstracting heat from the boiler gases for the benefit of combustion.

The Thousand Islander was built by the Toledo Shipbuilding Co., Toledo, Ohio.

British Columbia-Mexico Steamship Service.

The Pacific Canadian Steamship Co. Ltd., has been formed in Liverpool, Eng., to take over the Canadian Mexican Pacific Steamship Co., which operates a steamship line between Victoria, Vancouver and Salina Cruz, in connection with the Tehuantepec National Ry., which latter crosses the Isthmus of Tehuantepec to Puerto Mexico, on the Gulf of Mexico, where connection is made with the Gulf Transport Line to Europe. The company proposes to establish and maintain the running of a line of steamships between Canadian and Mexican ports, in particular between Vancouver and Salina Cruz, calling at intermediate ports whether in Canada, Mexico or the United States, and at San Francisco, and to adopt an agreement with the Tehuantepec National Ry. The capital stock is mentioned as \$100,000, half of which is subscribed by J. H. Welsford and Co., Liverpool, Eng., who either own or control the

Gulf Transport Line, the Canadian Mexican Pacific Steamship Co., the Union Steamship Co. of British Columbia, and the Boscowitz Steamship Co., and the remaining half by B. C. Pearson, London, Eng., of Sir W. D. Pearson and Co., who control the Tehuantepec National Ry., and who were the contractors for its construction. It is stated that the steamships Ikalis and Ikala of the Gulf Transport Line will be transferred to the Pacific Canadian service immediately.

The Canadian Mexican Pacific Steamship Co., received a subsidy from the Dominion Government for the service between Vancouver and Salina Cruz, a condition of the agreement being that no calls had to be made at any U. S. port.

New Brunswick-Prince Edward Island Car Ferry Service.

Differing from the usual custom of calling for tenders by advertisement, the Department of Railways and Canals issued a circular letter to vessel builders inviting tenders for the construction and delivery of a steel car ferry for the service on Northumberland Straits between Cape Tormentine, N.B., and Carleton Point, near Cape Traverse, P. E. I. The circular points out that special investigation has been made by Prof. A. K. Kirkpatrick, M. Can. Soc. C. E., of Queen's University, Kingston, Ont., into conditions of ice, currents and weather, and his report also suggests type, dimensions and power of the vessel. The vessel adopted will require to have a deck capacity of 10 loaded freight cars of 80,000 lbs. capacity each, or six passenger cars, each 76 ft. long over all, and must be capable of maintaining a speed of at least 14 miles an hour under load in open water, and be able to negotiate the worst conditions of ice to be encountered in the Straits at a speed of not less than half a mile an hour. The type of vessel suggested by the report would be something between the design of the Delaware and the Bessemer and Pere Marquette types. It should have an ice crushing bow with bow propeller of special nickel steel and engines of 200 i.h.p. each, belt plating, stiffening deck without camber or sheer at water level, to protect hull against pinching by moving ice floes. Two railway tracks would have to be provided with accommodation for five freight cars each, arranged to be loaded and unloaded over the stern, and with accommodation for passengers as well as crew. This would necessitate a vessel about 280 ft. long, 50 ft. beam and 16 ft. draught light and about 18 ft. draught under full load, which would be able to negotiate any of the ice conditions to be found in the Straits.

Tenders were invited to Aug. 15, and the successful tenderer will be required to deliver the vessel on the route not later than July 1, 1913, free of all charges. In addition to the deposit of 10% of the tender price, the successful tenderer will also be required to enter into a bond or other satisfactory security to the value of the remaining 90% of the tender price, which will be held for 12 months from the date of delivery of the vessel as an additional security for fulfilment of the specified requirements, more particularly as regards the overcoming of the ice conditions. Payment for the vessel will be made on delivery, provided the requirements of the contract and specifications are then fulfilled, apart from the actual overcoming of the ice conditions.

The contract for the construction of the Government grain elevator at Fort William, has been awarded to the Barnett-McQueen Co. The elevator is to be ready for operation by Sept. 20, 1913. The amount of the tender is said to have been \$1,179,503.

Patrol Steamship for the Dominion Customs Service.

Tenders will be received to Sept. 2, for the construction of a twin screw steel steamboat for the Customs service on the Atlantic coast, to be named Margaret, the profile of which is illustrated on this page.

Following are the principal dimensions, length between perpendiculars, 185 ft.; breadth, moulded, 32 ft.; depth, moulded to main deck, 16 ft.; draught, forward and aft, 10½ ft.; deadweight, 175 tons; coal, full supply, 200 tons; indicated horse power, 2,000; complement, officers and crew, 32; armament, two 6 pounder quick firing guns.

She is to be of steel throughout except where otherwise specified, under Government survey; fitted with water ballast and double bottom; ram stem, cruiser stern and five main transverse water tight bulkheads extending to the main deck.

The machinery is to consist of twin screw triple expansion engines with two Yarrow water tube boilers, working under forced draught. The armament of two 6 pounder quick firing guns will be supplied by the Government. A complete electric lighting installation is to be

the boat, with the result that it crashed into the upper gates (head), carrying them away. The rushing water from the upper level, locks 23 and 24, carried the boat back some distance, the stern striking the corner of a bridge over a narrow channel which connects the canal prism and the equalizing basin alongside. A hole was punched in the boat, but it was soon repaired, and she did not sink. The protection, or stop, logs along the west bank of the canal prism were washed out into the adjoining embankment, the flood of water also overtopping the same and doing some little damage to the G.T.R. tracks, which run immediately along the base of the embankment. Fortunately, there was no loss of life, as was the case when the government steamboat La Canadienne carried away the gates of lock 22, which is located about 900 ft. below lock 23.

New gates were sent up at once from Port Dalhousie, on Lake Ontario (a supply being kept there all the time), and were installed Aug. 3. The canal was out of commission a comparatively short time. This is the third time this season that the canal has been tied up by accidents to lock gates.

The levels between Port Dalhousie and Thorold, locks 1 to 25, inclusive, are comparatively short ones, the distance being

Empress of Britain-Helvetia Collision.

The formal investigation into the causes of the collision of the C.P.R. s.s. Empress of Britain with the s.s. Helvetia, in the Gulf of St. Lawrence, July 27, when the latter vessel was rammed in a fog, and sank, was held early in August by Capt. H. St. G. Lindsay, Wreck Commissioner, and concurred in by Capt. Clift and Nash, as nautical assessors.

The court found that the Empress of Britain is alone to blame for the collision, inasmuch as the speed at which she was proceeding prior to the accident was excessive, considering the state of the weather at the time. During the investigation exception was taken to the action of the master of the Helvetia when the Empress was sighted, but in view of the close proximity of the two vessels and the speed of the Empress, the court is of opinion that the collision was unavoidable, and also that, as the Helvetia was under a port helm with engines stopped when the Empress was sighted, the master of the Helvetia adopted the best course open to him under the circumstances. The court censures the master of the Empress of Britain, but on account of his previous good record, the skilful

Patrol Steamship for the Dominion Customs Service.

supplied, including two sets of dynamos and engines, search light, etc. All the auxiliary machinery is to be of the latest improved type, and the Marconi system of wireless telegraphy is to be installed.

Another Lock Gate Accident in the Welland Canal.

An accident to the gates of lock 22, Welland canal, which occurred June 20, was fully described and illustrated in Canadian Railway and Marine World for August. Another accident on this canal happened August 2, this time to lock 23, both the upper and the lower gates being carried away as the result of the collision of a steamer.

The wooden freight steamer Wiley M. Egan, 252.2 ft. long, 39.8 ft. in breadth and 20 ft. deep, with a gross tonnage of 1,677 and a net tonnage of 1,380, built in Cleveland, Ohio, in 1887, and carrying a crew of 17, was bound light from Deseronto to Ashtabula to load coal. She had entered lock 23 under good control. Approaching the upper gates, the captain gave the required bells to reverse and stop. The engineer understood the signal, but was unable to control the advance of

about nine miles. The summit level, however is about 18 miles long. To guard against what might be very serious consequences, a guard-gate is located about 900 ft. south of lock 25, the end of the summit level. This guard-gate is invariably closed whenever the gates of lock 25 are open, as well as at other times when no traffic is passing lock 25, lock tenders being stationed at both places. To regulate the opening and closing of these upper gates, two semaphores are installed, one at each place (guard-gate and lock 25). As the distance between is short, about 900 ft., they can readily be seen by the lock tenders, their operation thus being visual. They are also provided with white and red lights for night work. The opening or closing of the gates operates these semaphores automatically.—E. Lowe in Engineering News.

A press dispatch from Liverpool, Eng., early in August stated that on account of the prevalence of ice in the North Atlantic, steamship companies interested decided that it would be undesirable to revert to the northern track for west bound vessels on Aug. 15, and for east bound vessels on Aug. 24, as had been arranged, and that no change would be made in the routes before Aug. 31.

manner in which he handled his vessel after the impact, and the efficient way in which steps were taken to rescue the crew of the Helvetia, does not deal with his certificate.

Canadian Notices to Mariners.

The Department of Marine has issued the following:—

56. July 24. 145. Ontario, Lake Ontario, Cobourg harbor, outer portion of central pier carried away, temporary light and buoy, caution. 146. Ontario, Lake Ontario, off mouth of Niagara river, change in position of gas and bell buoy, bell buoy to be established. 147. Ontario, Detroit river, Ballard reef channel, deepening of western half of channel completed, change in position of gas buoys, channel for light draught vessels marked by lighted buoys.

57. July 29. 148. Ontario, Lake Ontario, Toronto harbor, new western entrance, color of front range lighthouse, character of back range light. 149. Ontario, Lake Ontario, Welland canal entrance, Port Dalhousie, front range light improved. 150. Ontario, St. Clair river, Chenal Ecarte, buoy established. 151. Ontario, Lake Huron, north channel, Clapperton island, light improved. 152.

Ontario, Lake Superior, Thunder bay, Port Arthur, light established on Thunder bay elevator wharf, gas buoy placed temporarily at entrance to channel to Thunder bay elevator.

58. July 29. 152. Nova Scotia, south west coast, westward of Cape Sable, Cornwall rock, buoy established. 154. Nova Scotia, North Atlantic Ocean, Sable Island, west end, intended change in character of light. 155. Nova Scotia, Cape Breton island, east coast, South Ingonish harbor, light established on breakwater.

59. Aug. 2. 156. British Columbia, Vancouver island, east coast, Nanaimo harbor, Newcastle island passage, uncharted rock, buoy established. 157. British Columbia, Strait of Georgia, Malaspina strait, Lund, Ragged islands, change in position of light. 158. British Columbia, Chatham sound, Prince Rupert harbor, Barrett rock, gas buoy replaced by gas and bell buoy.

60. Aug. 7. 159. Prince Edward Island, north coast, Savage harbor, change in position of range lights. 160. New Brunswick, east coast, Miramichi bay, Grandoon flats, dredging. 161. New Brunswick, Chaleur bay, Caraqueet harbor, dredging. 162. Newfoundland, east coast, Cape St. Francis, change in fog alarm. 163. England, south coast, Southampton harbor, light buoys established.

61. Aug. 13. 164. British Columbia, Chatham sound, Prince Rupert harbor, Charles point, fog bell established. 165. British Columbia, Queen Charlotte islands, Graham island, north coast, Virago sound and Naden harbor, hydrographic notes.

62. Aug. 14. 166. Ontario, Lake Erie, Pelee passage, Grubb reef gas buoy, color of light. 167. Ontario, St. Clair river, Point Edward, gas buoy withdrawn. 168. Ontario, Lake Huron, north channel off Gibbons point, uncharted shoal located, buoy established. 169. Ontario, Lake Nipissing, South bay, South river mouth, buoys established. 170. United States of America, Lake Superior, Whitefish point, submarine bell established.

63. Aug. 17. 171. New Brunswick, south coast, Bay of Fundy, St. Andrews harbor, changes in buoyage. 172. New Brunswick, north coast, Chaleur bay, Caraqueet harbor, change in position of gas buoy. 173. Nova Scotia, south coast, approach to Dover harbor, uncharted shoal southward of Black rock, buoy established. 174. Prince Edward Island, south coast, Northumberland strait, Belle river, buoys established. 175. Quebec, River St. Lawrence, ship channel between Quebec and Montreal, St. Pierre les Becquets to Batiscan, changes in buoyage. 176. Newfoundland, east coast, Ariege bay, existence of shoals.

64. Aug. 20. 177. Ontario, St. Clair river, Sarnia, removal of wreck of steamer Joliet. 178. Ontario, Lake Huron, Goderich, south breakwater under construction. 179. Ontario, Georgian bay, Meaford, change in position of breakwater light, range lights discontinued.

Electrically Propelled Vessels for the Canadian Lake Trade.

The Montreal Transportation Co. has ordered in England, a vessel for the lake and canal trade, which is to be a departure from the customary means of propulsion, in that electricity will be utilized for the purpose, for the first time in a vessel of such size. The machinery will consist of two 300 h.p. high speed Diesel engines, each connected with an alternating current generator and exciter, and on the propeller shaft, just ahead of the thrust block, there will be fitted the armature of a large induction motor running at about 80 r.p.m. The whole of the mechanism will be controlled from the bridge. The vessel will be of the

usual Canadian canal size, with a dead-weight capacity of 2,400 tons on a 14-ft draught.

The vessel has been designed by John Reid and Co., Montreal and Glasgow, the electrical system to be adopted being invented by H. A. Mavor, Glasgow. J. Reid, stated in Montreal, recently, that the peculiar conditions encountered in Canada in the canal traffic had caused the country to lead the world in experimenting in such matters. The absolute limit of hull capacity had been reached at above 2,200 tons, and as a result the only way to add somewhat to the capacity was to reduce the weight of the engines. Canal boats required very coarse pitch propellers, working at about 80 r.p.m. With the Diesel engines on the vessel Toller, the propellers run at about 250 r.p.m., and as a result, the vessel is not so well adapted for the Canadian canal traffic as she might have been. With the electric motive power, the proper speed will be easily obtained.

Atlantic and Pacific Ocean Marine.

The Manchester Liners s.s. Manchester Inventor, which collided with an iceberg off Belle Isle, towards the end of July, and went to St. John's, Nfld., for examination and repairs, left the dry dock there, and sailed for Manchester, Eng., Aug. 13.

The Lord Mayor of Bristol, Eng., who was visiting Canada, recently, in connection with the Cabot celebrations, is reported to have stated that the Canadian Northern Steamships Ltd., had promised to arrange a weekly service between Canada and Bristol.

The Allan Line s.s. Corsican, while outward bound, Aug. 12, struck an iceberg in the Belle Isle strait, sustaining some damage to her stem, above the water line. After examination of the damage, the captain decided to proceed on his voyage across the Atlantic, and she arrived at Liverpool, Eng., Aug. 21, in safety.

Announcement is made of the retirement of J. S. Park and N. H. Dunlop from the board of directors of the Allan Line. The former's connection with the company has lasted over 41 years, and it is stated that, as owner of the Park Line, he will still be associated with the shipowning business at Glasgow, Scotland.

The British s.s. Eric bound from Rosario, Argentine, for Quebec, with maize, for J. Richardson and Sons Ltd., went ashore on Sable Island, Aug. 14, and subsequently broke up, becoming a total loss. She was built at Whitby, Eng., in 1892, and was screw driven by triple expansion engines having cylinders 23, 37½ and 61½ ins. diam. by 39 ins. stroke, 235 n.h.p. Her dimensions were, length 312.5 ft., breadth 40.7 ft., depth 21.9 ft., tonnage, 2768 gross, 1788 register.

The Union Steamship Co. of New Zealand's s.s. Niagara, under construction at Glasgow, Scotland, for the Australasia-Canada mail service, was launched there, Aug. 17, the christening ceremony being performed by Mrs. Borden, wife of the Canadian premier. The vessel's dimensions are, length 522½ ft., breadth 66 ft., depth 37½ ft., and she will be about 13,000 tons gross. The equipment will be of the highest and most modern class, and wireless telegraph equipment will be installed. The propelling machinery will be of the combined reciprocating and turbine type, with boilers fitted to burn either coal or liquid fuel, for a speed of 17 knots an hour. A full number of boats and life saving appliances will be provided to serve all passengers and the entire crew, and there will also be a complete electric light installation.

The report of Furness Withy and Co. for the year ended April 30, shows the earnings, including balance brought forward from the previous year, of £768,622 2s. 5d., compared with £564,339 14s. 7d. for the previous year. After paying directors' fees, income tax, etc., there remains £756,121 0s. 3d. The usual half-yearly dividend on preference shares, and the interim dividend on ordinary shares at 5% per annum, were paid Nov. 1, 1911, and there has been transferred to depreciation account, £240,000, leaving an available balance of £430,810 16s. 7d. A bonus of 5% on the ordinary shares was declared, making 10% for the year. The report announces the addition to the company's fleet of the steamships Hochelaga and Langan, specially built for the coal trade, and leased to the Dominion Coal Co. Description and illustration of these vessels have already appeared in Canadian Railway and Marine World. Announcement is also made that a Diesel engined vessel, named Eavestone, has also been launched for the company.

Maritime Provinces and Newfoundland.

The Crystal Stream Steamship Co. is negotiating for the purchase of an additional steamboat in the U. S., for the St. John-Fredericton route.

The Dominion Atlantic Ry. s.s. Yar-Prince George ran aground on the flats on the eastern side of the channel at Yarmouth, N.S., Aug. 12, and was refloated the next day without damage.

The Dominion Atlantic Ry. s.s. Yarmouth while entering St. John harbor, during a fog, Aug. 12, struck a rock, but was got off again with very little loss of time and practically without damage.

The s.s. Wobun, owned by the Wobun Steamship Co. Ltd., a subsidiary of the Nova Scotia Steel and Coal Co., is reported to have been sold for £17,000. She was built at Greenock, Scotland, in 1902, and has engines with cylinders 19, 31 and 51 ins. diam., by 36 ins. stroke. Her tonnage is 1,551 gross, 990 register.

The Imperial Dry Dock Co. Ltd., which had a charter for the construction and operation of a dry dock at St. John, N.B., has sold all its rights and privileges to Norton Griffiths and Co. Ltd., the contractors for the building of the dry dock and other works at Courtenay Bay, St. John, for \$75,000. The Imperial Dry Dock Co. was promoted in 1900, and a certain amount of stock was taken up locally. It is reported that the amount realized by the sale, will pay all expenses, and return the shareholders double the money they paid in.

Province of Quebec Marine.

The Minister of Public Works, at a dinner at Quebec, Aug. 1, stated that if a company was not willing to undertake the construction and operation of the proposed Quebec dry dock, the Government would do so.

It is reported that the Montreal Harbor Commissioners have decided to build three large grain elevators, each with a capacity of 2,500,000 bush. It is stated that they will probably be of re-enforced concrete, but the general details have not been made public.

C. C. Ballantyne, one of the Harbor Commissioners who arrived in Montreal from Great Britain, Aug. 11, stated that the floating dry dock, at the launching of which he was present, might be expected in Montreal about the middle of September. It was being towed across the Atlantic by three powerful tugs.

The Levis Dry Dock Realty Co. Ltd.,

has been incorporated under the Quebec Companies Act, with \$100,000 capital, and office at Quebec, to carry on any operations connected with construction generally, and with real estate. The incorporators are, J. Paradis, J. A. Lesage, L. Moraud, A. Savard and R. Pare, Quebec.

Capt. L. A. Demers, harbor master, Montreal, recently stated that because of the new order which he has introduced, to the effect that either a harbor master, or deputy harbor master, must be present at the arrival and departure of each vessel, he expects that a second deputy harbor master will have to be appointed.

The new lighthouse on St. Helens Island, near Montreal, is of re-enforced concrete, the base being 52 ft. square. The tower is 11 1/4 ft. square at the base, tapering to 6 1/4 ft. square at the top. The lamp is of the catadioptric type, the light being supplied by vaporized coal oil. It is expected that the structure will be completed early in September. The cost is reported as \$21,000.

The Dominion Public Works Department has received tenders for the construction of piers 1 and 2 in connection with the Louise dock extensions. The work includes considerable dredging in the St. Charles river. The north side of the Louise embankment wall will have to be extended 100 ft. further into the river for a length of 500 ft. Pier 2 will be 1,000 ft. long extending from the embankment towards Beauport in line with the breakwater extension, and will be 350 ft. wide with freight sheds built thereon. In connection with pier 3, it is intended to build one half at present, and the other half at some future date. The entire work is estimated to cost over \$2,000,000.

The returns for July show that permits to pass through the Lachine canal were issued to 1,064 vessels, against 964 issued in July, 1911. The various commodities passing through the canal during July were, wheat, 2,617,411 bush.; oats, 860,859 bush.; flax, 99,388 bush.; flour, 99,188 bbls.; eggs, 2,645 cases; butter, 1,112 pkgs.; cheese, 43,985 boxes; coal, 98,580 tons; coal, landed on banks, 70,853 tons.

The C.P.R. and the Sincennes-Naughton Line, were each fined \$1. by the Montreal Harbor Commissioners, Aug. 1, for breaking bylaws of the port regarding the dumping of refuse in the harbor. Charges against the White Star-Dominion Line and the Richelieu and Ontario Navigation Co., in respect of their steamships Megantic and Saguenay, for passing up the river in front of the harbor at excessive speed, were dismissed, as the defendant companies pointed out that the Harbor Commissioners had no jurisdiction over vessels passing outside the harbor.

Ontario and the Great Lakes.

The steamboat Alexandra, formerly known as Sunbeam, registered at Lindsay, Ont., has had its name changed by order in council to Arthur C.

The gates of lock 23 on the Welland canal, were carried away, Aug. 2, by the Pittsburgh and Erie Coal Co.'s steamboat Wiley M. Egan. Traffic was suspended for the better part of a day, while new gates were rushed up from Port Dalhousie.

Press reports state that the Government will, during the coming winter, build an addition to the Port Colborne elevator, increasing its storage capacity from 800,000 to 2,000,000 bushels. The existing elevator was designed by J. A. Jamieson, Montreal, who has the preparation of plans, etc., for the extension in hand.

The Canadian Interlake Line steamboat Hamiltonian, which was recently built at Port Arthur, for the Montreal

and Fort William package freight trade, was put into service early in August, when the company entertained a party of citizens at Hamilton, after which city the boat was named.

The Richelieu and Ontario Navigation Co.'s steamboat Macassa was taken off the Hamilton route, and placed on a special route, Aug. 28, running between Cobourg, Port Hope, Bowmanville, Oshawa and Toronto, for traffic in connection with the Canadian National Exhibition at Toronto. For similar purpose, the company's steamboat Rochester was run between Oswego and Charlotte, N.Y., and Toronto.

The Superior Elevator Co. Ltd., has been incorporated under the Dominion Companies Act, with \$150,000 capital, and office at Winnipeg, to carry on a general grain and elevator and grain warehouse business, and in connection therewith to own and operate steam and other vessels, and carry on a general transportation business in freight and passengers. The incorporators are, W. L. Parrish, G. N. Heimbecker, F. B. Hamilton, W. J. Dowler and J. T. Haig, Winnipeg.

The U. S. Lake Survey reports the levels of the Great Lakes in feet above tidewater for July, as follows, Superior 602.26; Michigan and Huron 580.48; Erie 572.56; Ontario 247.01. Compared with the average July levels for the past ten years, Superior was 0.34 ft. below; Michigan and Huron 0.60 ft. below; Erie 0.30 ft. below, and Ontario 0.16 ft. above. It was anticipated that Superior, Michigan and Huron would rise about 0.1 ft., and Erie and Ontario about 0.2 ft., during August.

The new steamship, City of Detroit III, which is now in service on Lake Erie, is the largest side wheel passenger steamship in the world. In the history of steamship construction she has only been exceeded once, and that was by the Great Eastern, which was 692 ft long. The Great Eastern, however, was both paddle and screw propelled. The City of Detroit III is 500 ft. over all, 55 ft. broad molded, 100 ft. over the guards, and has a molded depth of 22 ft.

The Department of Marine recently asked for tenders for the removal of the steamboat Douglas which was wrecked near Walkerville, several years ago, and which has been considered to be a menace to navigation. Before being wrecked she was operated between Kingsville, Pelee Island and Walkerville. The barge Monguagon, which ran aground above the Windsor waterworks,

about a years ago, is also to be removed. The latter vessel is owned in Detroit, Mich.

With reference to press reports that engineers of the Department of Railways and Canals are preparing plans for the construction of a new canal and lock at Sault Ste. Marie, and that instructions have been issued to go ahead with preparations for the work immediately, we are officially advised that suggestions have been made as to the desirability, in view of the growing traffic at that point, of having further canal accommodation, and that information is being gathered on the subject.

A quick system of handling sacks of flour for loading vessels, is in operation in the upper story of the C.P.R. freight shed at Fort William. An endless belt arrangement, reaching to every part of the upper story, has been set up, and is driven by a motor, the sacks are merely thrown on the belts and conveyed to the exit, where they are sent down a chute to the vessel hold. The arrangement was devised and set up by R. Armstrong, then Superintendent of the Fort William terminals, now Superintendent at Saskatoon, Sask.

An enquiry is being held into the causes of the foundering of the steamboat Adiramled, about six miles from Stony Island, Lake Ontario, in June, while bound to Montreal from Fairhaven, N.Y., with coal. She was built at Cleveland, Ohio, in 1866, and was rebuilt in 1882, at Detroit, Mich. She is equipped with engine of 30 n.h.p., driving a screw, and her dimensions are, length 198 ft., breadth 27.4 ft., depth 10.6 ft.; tonnage, 630 gross, 364 registered. She is owned by M. J. Morris, Montreal, who only recently acquired her from the United States.

An Ottawa press report states that from unofficial advices received there, the U. S. Secretary of War will refuse to allow the proposed Chicago drainage system to take additional water from the Great Lakes. When the matter was up for discussion recently, deputations from all the Dominion marine interests went to Washington, where they pointed out that the effect of the scheme would be to lower the water in all the harbors on the Great Lakes, by six inches at least, while the effect on the St. Lawrence, it was claimed, would be detrimental to Canadian navigation.

It was stated in Canadian and Marine World for August that the coffer dam arrangement used in replacing broken

Sault Ste. Marie Canals Traffic.

propeller blades on the Niagara Navigation Co.'s SS. Cayuga was designed by B. W. Folger, ex-General Manager. A letter has been received, stating that the device referred to was invented by Barlow Cumberland, formerly Vice-president, N. N. Co., as a result of experience gained by him with the SS. Campana, and that the coffer dam arrangement referred to was constructed by J. Whalen, formerly the N. N. Co.'s ship carpenter, under Mr. Folger's direction. The Campana, above referred to, was cut in two and taken up from Montreal in 1881 for the Canada Transit Co., under Mr. Cumberland, to run between Collingwood and Port Arthur, and was the first twin-screw steamship on any of the upper lakes.

Manitoba, Saskatchewan and Alberta.

The Department of the Interior has purchased a ferry steamboat from Grand Trunk Pacific Ry. contractors, for use on the Athabasca river, to maintain a service connecting with Jasper Park as a public convenience.

In connection with the proposal to improve the navigation of the Red river, it is reported that the survey of the portion south of the international boundary is to be taken up at the earliest possible moment, and it is expected to be completed before the severe weather arrives.

The Hudson's Bay Co.'s steamboat, Athabasca River, which was mentioned in our last issue as being under construction at Athabasca Landing, Alta., was launched about the middle of July. The machinery installed was taken from the company's steamboat Hazelton, which has been dismantled.

An Ottawa press report states that engineers of the Public Works Department are at work on the final report in connection with the surveys made for the proposed 6 ft. barge canal between Winnipeg and Edmonton. It is said that the report, with estimates, will be in the Government's possession early in the fall, and that an amount will be placed in the estimates, to cover the preliminary work.

British Columbia and Pacific Coast Marine.

During June, 66 steamships called at Prince Rupert, and during the same period, 65 sailed from the port, a daily average of two arrivals and two departures.

The Swift Steamship Co. has commenced a freight service between Puget Sound ports and Victoria, with its steamboat Neptune. She is 34 ft. long, with tonnage, 235 gross, 176 register.

The Vancouver Portland Cement Co.'s steamship Leona, which recently arrived at Victoria from England, was built at Glasgow, Scotland, in 1884, and is a steel screw, three masted vessel, with one iron deck. She has a cargo capacity of 940 tons, her gross tonnage being 634 tons, and 243 tons net.

A bylaw is under consideration by the West Vancouver council, providing for the borrowing of \$120,000 for the purchase of shares in the West Vancouver Ferry Co., thus increasing the company's capital stock to \$150,000. The company intends buying additional vessels, and extending its wharf accommodation and facilities.

It is reported that the C.P.R. will build a large slip at Kaslo, for the inauguration of a regular barge service between Kaslo and Nelson, in anticipation of heavy shipments of ore on the completion of the standardization of the Kaslo and Slocan Ry. It is stated that the cars will be run direct on the barges at Kaslo, transferred to the line again at Nelson, when they will be forwarded to Trail.

The Nanaimo Transportation Co., has been organized at Nanaimo, to operate

the steamboat Starling, on a daily schedule to Departure bay and Gabriola island. The Starling was built at Port Guichon in 1899, and she is equipped with engine of 2 n.h.p., driving a screw. Her dimensions are, length 30 ft., breadth 9 ft., depth 3 ft.; tonnage, 8 tons, gross, 5 tons, register.

Side Streams Navigation Co., Ltd., has been incorporated under the Dominion Companies Act, with \$50,000 capital, and office at Dawson, Yukon, to own and operate steam and other vessels, and conduct a general navigation and forwarding business, etc. The incorporators are, S. C. Barrington, J. Raymond, C. F. Merrified, W. H. Barrington and F. E. Allison, Dawson, Yukon.

The Dominion Department of Public Works will receive tenders, to Sept. 5, for the construction of a breakwater in Victoria harbor. Plans may be seen, and forms of tender obtained from the Department's Resident Architect, Victoria, the District Engineer, New Westminster; District Engineer, Toronto; District Engineer, Montreal; District Engineer, Quebec; and at the post office, Vancouver.

While there has been some increase in the insurance rates on some of the vessels operating on the Pacific coast, the rates on the Grand Trunk Pacific Coast Steamship Co.'s vessels have remained as last year. The steamships Prince Rupert and Prince George, which are valued at \$450,000 each; pay 5¼%, the Prince John, valued at \$75,000, 8-2/5%, and the Prince Albert, 9 guineas on a value of \$65,000.

W. P. Anderson, Chief Engineer, Department of Marine, in a recent interview at Vancouver, on his return from a tour of inspection of the northern waters of British Columbia, is reported to have stated that he had been looking into the question of improving the aids to navigation, and that he would advise the establishing of an acetylene beacon mounted on a screw pile foundation on Rose spit, on the north east coast of Graham island, the most northern of the Queen Charlotte group.

A press dispatch from Victoria states that the C.P.R. is negotiating for the sale of its steamboat City of Nanaimo. She was taken from the service last year, and has since been lying idle at Esquimalt. She was built at Vancouver in 1891, and after operating for some years between Vancouver, New Westminster and Nanaimo, she was bought by Jas. Dunsmuir, and operated with the steamboat Joan, until both were disposed of to the C.P.R. The engine is of 58 n.h.p., driving a screw. Her dimensions are, length 159 ft., breadth 32 ft., depth 9.4 ft.; tonnage, 761 gross, 518 register.

Electric Traction will supplant steam on the Boston-Providence section of the New York, New Haven & Hartford Rd. This is the third section to be so operated, and it will form part of a New York-Boston electric trunk line; the New York terminal zone, extending to Stamford, Conn., is already under operation, and an extension of the single-phase equipment to New Haven is under way. The work involves four tracking, grade reduction, and grade-crossing elimination. There will be a power house at Providence. The cost is estimated at about \$7,000,000. Only a small portion of the Boston South station and yard will be equipped at present.

G. T. Pacific Ry. Maintenance of Way Employees.—A new schedule of wages for these employees which has been arranged by M. Donaldson, Vice President, and General Manager, has been accepted by the employees and is now operative. The minimum wage of a section man is \$2 a day. Section foremen receive a minimum of \$79 a month.

Wireless Telegraph Alarm Bell.

A London cablegram says that in testifying at the Titanic enquiry, recently, G. Marconi described a new wireless invention for the safety of vessels. He said he had been working on it since the Titanic disaster. "My idea is," he said, "to make wireless apparatus ring a bell and thereby give warning that there is a ship in distress and in need of assistance. This can be done by a sequence of waves lasting fifteen to thirty seconds, which will cause the bell to give a prolonged ring. Some tests of the apparatus have been made, and I have considerable confidence that it can be employed."

A Proposed Trans-Atlantic Service.

While the Dominion Premier and other members of the cabinet were in England, recently, an interview was arranged by those interested in the proposal made some years ago to establish a fast steamship service between the west coast of Ireland and Halifax, N.S. Sir Thomas Troubridge explained that the company was organized in 1906 to build a harbor at Blacksod Bay, Ireland, and a railway connecting the harbor with the Irish railway system, and a contract had been placed for the carrying out of the work, which he anticipated would be finished in time to accommodate the large vessels which it was proposed to place on the Canadian route. He also stated that he and his associates were prepared to build the necessary vessels for such service both on the Atlantic and Pacific oceans, provided reasonable compensation for the carrying of mails, etc., was granted by the governments interested.

The Premier's reply stated that the question of increased facilities for transportation between Canada and Great Britain, and Canada, and Australasia, was one of the most important ones that the government had under consideration, and if the deputation had any further suggestions, or any modifications of former proposals to make, he would like them sent in at once, as the matter would have the earliest consideration on his return to Canada.

Commission on Sale of Steamships to Sir William Mackenzie.

Judgment was recently delivered in the English court of appeal, on the appeal of the Fairfield Shipbuilding and Engineering Co., Glasgow, against whom an order had been made for the payment, to W. Petersen, of £8,000, as commission on the sale of three steamships, now the Royal George and Royal Edward and another to Sir William Mackenzie, for £403,000. By a majority of the court, the appeal was allowed, and the judgment of the lower court reversed, it being held that there was no evidence of authority for the plaintiff to act on behalf of the company in the matter, and if any promise to pay commission was made by any of the company's directors, such a bargain was invalid, as the plaintiff was already acting for other proposed purchasers, with whom negotiations subsequently fell through, and he had not the assent of his principals to his bargaining for commission. On that ground therefore, he failed, and also failed on the ground that the purchase by Sir William Mackenzie was carried through independently of the plaintiff.

C. D. Sargent, M. Can. Soc. C.E., Resident Engineer, St. Lawrence canals, Cornwall, has been appointed Superintending Engineer, vice W. A. Stewart, Superintendent, resigned.

The British Maritime Trust Limited.

This company, which was originally established in 1888, to carry on the ordinary business of a trust and mortgage company, passed, in 1896, under the control of Furness, Withy and Co., and in 1897, the name of the British Maritime Mortgage Trust Ltd., was changed to the present one. The share capital is £1,000,000, in 200,000 shares of £5 each, of which 165,000 are issued and fully paid up. The balance of 35,000 shares was recently offered for subscription at a premium of 5s. a share, and an issue was also made of £500,000 5% first debentures of £100 each, at par, redeemable at 105.

The prospectus states that as the vast developments in Canada have led to a large demand for capital, the board has been directing its attention for some time past to the Dominion as a promising field for extending the company's business. Through its associations with Furness, Withy and Co., it commands an excellent organization of long standing in touch with projected enterprises of every kind. The present issue is mainly to take advantage of desirable Canadian

business already arranged for, and additional business for which negotiations are pending.

As a further aid in dealing with proposals from the Dominion, the directors have retained the services of a Canadian consulting adviser, C. G. Bryan, of Toronto, who has taken up his residence in London, Eng.

The directors have already conducted an important series of investigations and negotiations into a number of highly promising projects, the principal of which are, a substantial holding in the old established business of the Richelieu and Ontario Navigation Co., representing approximately 12,000 shares of \$100 each, which were on July 4, quoted at \$118, equal to \$1,416,000, or about £292,500. This important concern was formed in 1846. The last balance sheet, as at Dec. 31, 1911, showed paid up capital of \$5,311,875, and bonds outstanding to the amount of \$1,233,633.33. The assets at the same date after deducting current liabilities were \$7,260,697.44. It is paying quarterly dividends at the rate of 8% per annum. Besides owning a fleet of steamers, its property comprise offices, shipyards, workshops, warehouses, docks,

sheds, wharves, pontoons, hotels, cottages, etc., covering about 150 acres in all, and situated at Montreal, Sorel, Three Rivers, Quebec, Murray Bay, Tadousac, Longueuil, etc. In this already large undertaking there has now been merged the Northern Navigation Co., with its fleet and valuable properties at Collingwood, Sault Ste. Marie, Point Edward and Gore Bay. There has also been taken over, the Inland Lines Ltd., with its steamers and related interests. The entire combination, which also amongst other recent acquisitions. Includes the Niagara Navigation Co., possesses a fleet of some 70 steamers, by far the most extensive transport and passenger trade on the Great Lakes.

There have also been acquired or in course of negotiation, one half interest in the joint purchase with Furness Withy and Co., of the White Diamond Steamship Co., Liverpool, and an equal interest with them in the business of G. D. Warren and Co., of Liverpool, Eng., and Boston, Mass.; valuable freehold properties in Montreal, Toronto and Winnipeg; and an important harbor proposition in Vancouver, B.C., which should not only be a very valuable asset in connection with

the shipping development of that port, consequent on the opening of the Panama Canal, but which, if acquired on the terms proposed, should represent a considerable increment of value as real estate.

Lord Furness is chairman of directors, who are all located in England. The Canadian department consists of J. R. Binning, Montreal, Manager; W. Molson Macpherson, President. Molsons Bank, Montreal, Consulting Adviser in Canada, and C. G. Bryan, Canadian Consulting Adviser, London, Eng.

Nautical Assessors for Marine Enquiries in British Columbia.

The Merchants Service Guild of British Columbia, which represents captains and officers in the province's coasting and freight shipping trade, has through its Secretary, H. G. Jarvis, brought under the Dominion Government's attention the question of the appointment of nautical assessors sitting upon courts of enquiry into shipping casualties occurring in B.C. waters. Following are extracts from the memorial:—

"The Guild feels that the composition of these courts has recently been of a very unsatisfactory nature, and that this should be remedied without further delay, because there is a strong liability that incompetent decisions may be given, resulting in grave injustices being inflicted upon captains and officers whose certificates and professional status are involved. The assessors sitting upon recent cases have mostly been persons whose practical knowledge of the waters in which the casualties occurred, has been insufficient to justify their appointment, and the Guild would therefore respectfully suggest that future assessors should be persons who are, by personal experience in command of local vessels, thoroughly conversant with the navigation of the particular place where the acci-

dent occurs. The Guild considers that if greater discretion were exercised in the appointment of these officials, along the lines suggested, the local profession would receive fairer treatment and a sounder judgment would be obtained."

Vessels Removed from the Register.

The following vessels were removed from the register, during May and June, for the reasons assigned:— Steam—D. A. Martin, Ottawa, 57 tons, dismantled; D. B. Mulligan, Ottawa, 46 tons, dismantled; Hercules, Ottawa, 13 tons, broken up; Iona, Picton, Ont., 157 tons, burnt; J. S. Blazier, Collingwood, Ont., 60 tons, sold to foreigners; Kennebecasis, St. John, N.B., 10 tons, broken up; Lilly May, Collingwood, Ont., 7 tons, dismantled; Lorna Doone, Collingwood, Ont., 18 tons, abandoned; Mildred, Ottawa, 13 tons, foundered; Mink, Toronto, 38 tons, dismantled; Minnie D., Collingwood, Ont., 2 tons, out of existence; Samson, Ottawa, 8 tons, broken up; Vergey, Hamilton, Ont., 14 tons, out of existence. Sailing—Aldine, St. Andrews, N.B., 299 tons, wrecked; Arkansas, Lunenburg, N.S., 98 tons, lost at sea; Bertie Calkins, Kingston, Ont., 227 tons, sold to foreigners; Calceolaria, Halifax, N.S., 30 tons, transferred to Newfoundland; Earl of Aberdeen, Parrsboro, N.S., 416 tons, transferred to Barbados; Hancock, St. John, N.B., 346 tons, transferred to Newfoundland; James A. Stetson, Picton, N.S., 71 tons, wrecked; Kestrel, Shelburne, N.S., 99 tons, transferred to Newfoundland; Louise, Vancouver, B.C., 552 tons, wrecked and abandoned; Minnie F. Crosby, Halifax, N.S., 119 tons, sold to foreigners; Peerless, Yarmouth, N.S., 278 tons, transferred to Newfoundland; Uranus, Lunenburg, N.S., 90 tons, sunk; Warren W., Charlottetown, P.E.I., 79 tons, wrecked; Water Witch, St. Andrews, N.B., 12 tons, broken up; William A., Magdalen Islands, Que., 9 tons, out of existence.

Harbor Development on the Great Lakes.

The Minister of Public Works, who recently returned to Ottawa after an extended trip over the Great Lakes and a part of the St. Lawrence, stated that the appropriations of about \$40,000,000 made this year, seem quite inadequate to meet pressing needs at important points, on account of the rapid expansion in every direction. In the course of his tour he met boards of trade, municipal councils and other public bodies all of whom seemed conversant with the urgent needs of the various localities visited, as regards transportation, navigation, dock and wharfage facilities, and in no case did he consider that any extravagant requests had been made. He considers that there is a lack of proper facilities at Canadian ports, and the navigation improvements in the Detroit river behind the times. In referring to Sault Ste. Marie, he stated that Canada requires another lock, but as that comes under the Department of Railways and Canals, which he understood had the matter under consideration, he could not deal with it, beyond stating that he believed the work to be necessary. In general, the Minister deplored the general unpreparedness of the ports on the Great Lakes to meet the legitimate exigencies of trade.

The Department of Public Works received tenders, Aug. 28, for the construction of a breakwater at Port Arthur, Ont.

A press dispatch from Ottawa states that the act providing for the granting of aid in the construction of dry docks, will be amended on the reassembling of Parliament, it having been found that companies desiring to build dry docks have been unable to finance such undertakings under the present conditions. It is said that the amendment will take the form of a larger guarantee, or the payments of the guarantee during the time the work is proceeding.

The Construction of the Port Arthur Dry Dock.

Canadian Railway and Marine World for March contained a description by A. V. Powell, M. Am. Soc. C.E., of the dry dock which has been built at Port Arthur, Ont. Following are particulars as to the construction methods, plant, etc.

The dock is constructed of concrete and steel and rests upon a foundation of solid rock. A large amount of excavation was necessary, 90,000 cubic yards of earth and rock being removed. A 70-ton Marion shovel, with a 2½ yd. dipper fitted with Panama teeth was used. Digging began at the shore end in April, 1910, and trains and dump cars hauled by locomotives transported the excavated material to form an earth fill on either side, making new ground beyond the original shore line. To cut off

Fig. 1. Detail of Bilge Block.

the water during construction a cofferdam 900 ft. long was built in the shape of a horseshoe surrounding the site on three sides, as shown in fig. 2.

Two pile drivers, working in opposite directions from the portal end, drove round piles in two parallel rows, 900 ft. long, forming an enclosure around the entrance end 300 ft. wide. These piles, spaced 3 ft. centres, formed an outer and inner fence for the 6 by 10 in. and 2 by 10 in. sheet piling which was afterwards driven to rock. Waling strips 8 by 12 ins. were used for the sheet piling and round pile wales were used for the outside. Steel tie rods were placed across the cofferdam every 3 ft. On top of the round piling and sheet piling a framing was constructed of 8 by 12 in. timbers on which a temporary track was laid. As fast as the sheet piling was driven, earth filling was carried out by means of trains of dump cars operated by small locomotives. The resulting cofferdam was a very stable structure. To pump out and keep dry the dock excavation, and the enclosure formed by the cofferdam, three pumps were installed. The cofferdam completed, excavation was carried to rock throughout, enough shale and igneous rock being removed to level the basin. Six Canadian Rand drills and a 5 in. well boring machine comprised the drilling outfit.

The speed with which the concrete work was done was due to the organization of the working forces and the efficient arrangement of the plant. Placing concrete was so simplified that from the dredging to the final pouring the work was continuous. The arrangement of the construction plant is shown in fig. 2. Scows of 1,000 yards capacity, fitted with derricks and clam shell buckets, dredged sand and gravel from Lake Superior, at 60 miles from the site, and unloaded it at the portal face upon the cofferdam on either side of a travelling whirley; two hoppers placed over a 24-in. conveyor belt, electrically driven, received the materials from the whirley and alternately fed the belt which led to the mixer tower. Here were two receiving hoppers for sand and gravel, and below were two charging hoppers. The latter received the proper quantities of sand, gravel and cement for separate batches of con-

crete, and the whole charge was run into one of the two mixers below. A new charge was immediately prepared and this in turn was run into the second mixer. In this way it was possible to have the plant working to its full capacity without intermission. The concrete, after being mixed, was elevated by a bucket hoist, to V-shaped steel dump cars, of one yard capacity, on a truck running along the top of the forms for the dock wall. From the cars the concrete was poured directly into the forms. The tracks were laid in a number of loops crossing the dock excavation on trestles, so that there was no confusion in returning empty cars to the mixers. (Fig. 2.) By this system as much as 1,000 yards of concrete was placed by two shifts in one 24-hour day.

The forms for the side walls were made in small sections, for convenience in handling. Each section was 5 ft. wide and extended the full height of the wall. Seven of these were placed together and bulkheads were attached at each end. In this way a section of the wall 36 ft. long could be poured, making a huge monolithic block. Alternate 36 ft. lengths were first built, and when the concrete had finally set the intermediate sections were poured. An expansion joint was formed for every 36 ft. of length, and so cracking was obviated.

The dock proper is 85 ft. 4 ins. wide at the floor level and 98 ft. 8 ins. at the top of the walls. It is 700 ft. long, and a further length of 28½ ft. within the portal or entrance may be utilized. Spaced every 18 ft. in the side walls are three altar steps designed to hold lateral bracing to support vessels in the dock.

The floor is solid concrete from 2 to

mixture, which is used also in the side walls. The outside corners are curved and are protected from injury by steel plates firmly attached by means of steel angle anchors embedded in the concrete. The portal jambs and sills are faced with steel. Angles 6 by 6 by ¾ ins., firmly fastened to the concrete floor by 3 by 3 by ½-in. angles, 4 ft. long, spaced 2 ft. apart, form a connection for the 16 by ¾ in. plate against which the heavy steel gate and caisson rests. Strong lateral anchors embedded in the portal piers hold the jambs in position. Great care was exercised in placing this steel framework to obtain a truly vertical and longitudinal alignment.

A feature of interest is the construction and arrangement of the bilge and keel blocks with their attachments. The slides upon which the bilge blocks move are spaced 12 ft. apart on each side of the dock, and are made of 3 by 14 in. white oak timbers bolted every 2 ft. Split anchor bolts, ¾ by 18 ins., fasten them securely to a concrete base and the nuts are countersunk, leaving a smooth upper surface on which the bilge blocks slide. These blocks are 4½ ft. in height, made of 12 by 12 in. Oregon fir timbers. They are drift bolted together at the ends and are furnished with slide irons and wooden slide blocks clamping them to the slides.

Two hauling chains are attached to each block by means of U bolts, and two fair leaders are attached to the dock wall, one at the lower angle and the other near the top. The keel blocks, constructed of 12 by 12 in. white oak timbers, fastened together with 1 by 20 lag screws, rest on a 12 by 14 in. white oak timber set in the concrete floor and fastened thereto with 24 in. expansion

Fig. 2. Arrangement of Construction Plant for Mixing and Handling Concrete.

4 ft. thick, sloping towards a central drain which terminates in a rudder well at the portal end. From the rudder well a drain protected by an iron grating gives access to the pumping well situated in the west portal pier. With a view to future extension this drain was duplicated on the opposite side of the pumping well so that when a second dry dock is built parallel to the present basin, the pumping outfit will serve for both docks.

The portal walls are solid masses of concrete, faced with concrete of a 1-3-5

bolts. These are spaced 6 ft. apart and extend from the rudder well to within 12 ft. of the shore end of the dock.

Concrete sidewalks 5 ft. wide run the full length at each side, and four reinforced concrete stairways lead from their ends to the top of the dock walls. The dock was begun April, 1910, and completed by the end of November of the same year. The work was carried out under the direction of W. R. Sinks, Manager, and R. H. Folwell, Engineer for the contractors, Canadian Stewart Co., Ltd.

The Floating Dry Dock for Montreal.

The dry dock, which has been built at Barrow, Eng., for the Canadian Shipbuilding and Engineering Works, to be located at Maisonneuve, Montreal, the launching of which was mentioned in our last issue, is 600 ft. long by 135 ft. wide over all. The depth of the pontoons at the bottom is 17 ft., the side walls rising to a height of 42 ft. from the pontoon deck, so that the over all depth is 59 ft. Vessels of 100 ft. beam will be easily docked, and as the ends are opened, vessels of any length can be accommodated. There are bridges at both ends for the conveyance of the workers. This type of dock was chosen in preference to a masonry or concrete construction, because although normally it will be utilized within the basin which has been prepared for it at Montreal, it will be possible to tow it to any point on the Atlantic coast to assist in the raising of any vessel which may get damaged by running aground, etc. A feature in the design was the aim to economize in the working of the dock, thus, although it will be capable of taking the heaviest vessels, it will be more frequently used

The Montreal Floating Dry-Dock, under construction, April 2, 1912.

for vessels of moderate size, and on such occasions it will not be necessary to use the whole of the dock, nor to run the machinery at its full power. In structural details everything has been done to make the dock continuously reliable. Steam heating is provided, to prevent the water in the compartment freezing. All the machinery in the dock is being supplied in duplicate, and the equipment includes every conceivable appliance to facilitate the docking of a vessel.

The completed works will occupy about 30 acres with a water frontage of 2,500 ft. and when fully working will give employment to about 2,000 men. The buildings generally will be of steel frame construction and brick, and the vessel construction berths will be so arranged that vessels up to 1,000 ft. long can be built.

After the launching ceremony, Sir A. T. Dawson, one of the directors of Canadian Vickers, Ltd., stated that in the near future the company intended to have in Canada an organization approximating generally to that existing at the Barrow works, for the building and equipping of vessels of all types. The dock should arrive in Montreal in the early part of September.

British Columbia Quarantine Regulations.

The Marine Department has issued the following information regarding quarantine regulations for vessels trading to B.C. ports:—

The quarantine station for the ports of Victoria and Vancouver, Vancouver Island and the lower mainland of British Columbia, is at Parry Bay, on the southeast coast of the island, and all vessels bound for the foregoing and other ports in that district must call at that station for inspection and permission to proceed to port of destination. Vessels from ports on the U.S. Pacific coast, including Alaska, are exempt from the usual quarantine inspection, but in the event of epidemic disease prevailing at the port of departure, the exemption will be withdrawn, and the vessels must then call at the quarantine station. Should any case of infectious disease, or suspicion of such, develop during the voyage, a vessel must proceed without delay to the quarantine station. An inspecting officer is stationed at Port Alberni, who will clear any vessel which has a clean bill of health. In case of illness requiring fumigation,

Telegraph and Cable Matters.

C. F. MacGowan has been appointed agent, Great North Western Telegraph Co., Belleville, Ont., vice P. F. Canniff, resigned.

A. B. Smith, Manager of Telegraphs, G.T. Pacific Ry., was in Prince Rupert, recently, arranging for the handling of telegraph supplies for the line erection as soon as the Skeena River bridge is completed.

The C.P.R. Telegraph Department has opened offices at Mount Stephen House, Field, B.C.; Bethany, Bethany Jct., Brechin, Eldon, Grass Hill, McAlpin, Petewawa camp, Orillia, Point au Baril and Uthoff, Ont.; Expanse, Khedive and Milden, Sask.

The C.P.R. has arranged a new schedule of wages for its commercial telegraph operators, by which an increase of \$5 a month is granted to all operators, with two weeks holiday with pay, after four years' service. In addition to some slight changes in rating, a number of employees will receive increases amounting to \$10 a month.

The Michigan Central Rd. telegraph employees in Canada have been granted increases in pay amounting in some cases to \$10 a month, and men operating telephones for train dispatching purposes are to be classed and paid as telegraphers. In connection with the employees' demands for increased pay, etc., a conciliation board was appointed some time ago, but the agreement outlined has been reached without the board's aid.

J. T. Phelan, Superintendent of Government Telegraphs, who returned to Vancouver, Aug. 15, from a trip of inspection of the telegraph lines in the north, stated that on account of the amount of business being handled by the lines there, further extensions, no doubt, will be made. The line from Bella Coola to the coast to connect with 150 mile house on the Caribou main line is about half finished, and the remainder, about 140 miles, will be ready for operation before the winter.

The C.P.R. has installed automatic instruments for its telegraph service between Montreal and Toronto, and if it proves successful, it is stated that the system will be extended. The instrument is known as the Morkrum system, and it is described as an automatic printer based on the selector system, the transmitter operating a keyboard similar to that of a typewriter at one end of the wire, the printing arrangement being at the other end, into which perforated rolls of blanks are automatically fed.

The Great North Western Telegraph Co. has opened offices at Eganville station, Ont., and Pierreville station, Que.; has re-opened its offices at Ameliasburg, Clifton House, Niagara Falls, Crystal Beach, Grimsby Beach, Petewawa camp, Royal Muskoka Hotel, Wheatley, Ont.; Abenakis Springs Hotel, Les Eboulements wharf, Manoir Richelieu Pointe au Pic and Pointe a Pic, Que.; Beaumaris, Maplehurst, Port Colborne and Rousseau, Ont.; and has closed its offices at Eganville, Morton, Florence and Lions Head, Ont., and St. Roch de Richelieu station, Que.

B. S. Jenkins, General Superintendent, C.P.R. Telegraphs, Western Lines, who was in Vancouver, Aug. 17, is reported to have stated that construction had been commenced on the erection of an additional through copper wire from Port Arthur, Ont., to Vancouver, an additional circuit from Vancouver to Revelstoke, an additional circuit from Moose Jaw to Winnipeg, an addition copper wire from Moose Jaw to Outlook, Sask., connecting with the wires to Calgary, thus giving another through alternative route from Winnipeg to Revelstoke. These extensions are additional to those authorized early in the year.

The British s.s. *Wilhelmina*, which recently ran on the rocks at Peters River, Nfld., and was considered a total loss, has been refloated. An examination is being made as to the damage sustained.

During June, five employees were killed, and one was injured, in the course of their work in connection with the navigation of Canadian waters. The deaths were all due to drowning, three being caused by falls overboard, one by falling from a wharf, and one as the result of a collision.

Trade and Supply Notes.

The matter which appears under this heading is compiled, in most cases, from information supplied by the manufacturers of, or dealers in, the articles referred to, and in publishing the same we accept no responsibility. At the same time, we wish our readers to distinctly understand that we are not paid for the publication of any of this matter, and that we will not consider any proposition to insert reading matter in our columns for pay or its equivalent. Advertising contracts will not be taken with any condition that accepting them will oblige us to publish reading notices. In other words, our reading columns are not for sale, either to advertisers or others.

The B. Greening Wire Co., Hamilton, Ont., has issued an illustrated catalogue of wire rope and fittings giving most complete information about the various lines they manufacture.

The American Vanadium Co., Pittsburgh, Pa., has issued "Vanadium Steels," an 80 page booklet, giving complete and up to date illustrated information on experience with vanadium steel, the various types, compositions, heat treatments and tables of tests, all of which is of considerable value to engineers and others interested in steel and iron products.

The Dominion Bridge Co., Ltd., has been incorporated under the Dominion Companies Act, with a capital of \$10,000,000 and offices at Lachine, Que., to carry on a bridge building business, and in connection therewith to build railway sidings and tramways, to own rolling stock, to own and operate steam tugs, barges, etc., and to carry on various incidental businesses.

The output of Titanium steel for 1911, according to statistics compiled by the American Iron and Steel Association, was 402,808 gross tons, comprising 252,540 tons of Titanium open hearth and crucible steel and 150,546 tons of Titanium Bessemer steel. This was a considerable increase over the output of 1910, and shows a remarkable gain for Titanium steel; in as much of the production of steel castings decreased 31.2 per cent. from the output of the previous year.

The Canadian Fairbanks-Morse Co., Ltd., has been granted supplementary letters patent increasing its capital stock to \$3,100,000, and has arranged for the issue of \$1,000,000 preferred stock, of which \$400,000 will go into plant enlargement. It has been decided to increase the manufacturing facilities at Toronto by the erection of a shop 350 ft. by 100 ft., to be used partly as a forge for making tractor trucks, and the remainder of the shop for mounting the engines on them.

The Canadian Fairbanks-Morse Co., Ltd., has secured the Canadian agency for the Orenstein-Arthur Koppel Co. of New York, consulting engineers and manufacturers of portable railways, industrial railways, narrow gauge sidings, narrow gauge public railways, and railway equipment of all descriptions, their works being located at Koppel, Pa. Their catalogue 400, which covers their lines very comprehensively, can be obtained from the Canadian Fairbanks-Morse Co., Ltd., Montreal.

M. Beatty & Sons, Ltd., manufacturers of dredges, ditchers, derricks, steam shovels, etc., Welland, Ont., have recently undergone a change of management, owing to the desire of the senior members of the Beatty family to take a less active part than heretofore. The Browning Engineering Co., of Cleveland, Ohio, has acquired control, and it is said that the plant will be considerably enlarged. R. A. Greene, heretofore Chief Engineer, Browning Engineering Co., has been appointed General Manager. A. O. Beatty, heretofore Engineer and Manager, will act in an advisory capacity as Consulting Engineer. F. H. Owen, heretofore Secretary-Treasurer, has been appointed Treasurer. G. Day, heretofore Assistant Sales Manager, Browning Engineering Co., has been appointed Secretary and Sales Manager. R. M. Beatty continues

as Superintendent of Works, and E. R. Beatty continues as Purchasing Agent.

C. H. Besly and Co., Chicago, Ill., have placed on the market a combination disc grinder and drum sander for wood pattern making. The disc wheel is of steel, 30 ins. diam., and runs at 750 r.p.m., and the working table may be tilted and locked at any angle from 75 to 135 degrees. It has also a vertical adjustment of 25 ins. The equipment includes four work table attachments, the sizing circle gauge for cylindrical and conical grinding, the sliding bevel gauge for simple and compound angle grinding, the sizing bevel gauge for simple and compound angle grinding to dimensions, and the angle plate for freehand cornering of thin work. The drum sanding arrangement has a work table 24 by 28 ins., which may be tilted and locked to any angle from 85 to 105 degrees from the axis of the sand drum. It runs at 2250 r.p.m., and has a perpendicular reciprocating motion while running. The machine is driven by a 3 h.p. motor, through sprockets and link belt attachment is chain, and the sanding attachment is driven by a self oiling friction clutch, which enables the operator to stop the sander regardless of the disc wheel. The machine is made with 30 or 40 in. diam. disc wheels, either belt or motor driven, and occupies a floor space of 54 by 84 ins.

British Columbia's Public Works Department is spending \$8,500,000 for roads, bridges and other improvements. Some of the new roads are located 1,200 to 1,500 miles north of Vancouver. J. E. Griffith, known in the west as the man who walked from Winnipeg to Vancouver while making C.P.R. location surveys, in the 80's, is chief engineer.

P. R. Gransaul, in writing us from St. Joseph, Trinidad, B.W.I., remitting renewal of subscription, says:—"I cannot close my letter without telling you of my appreciation of the Canadian Railway and Marine World. I look forward to getting it every month, and to me it is almost like receiving a personal letter."

TENDERS

TENDERS, addressed to the undersigned at Ottawa, and endorsed on the envelope, "Tender for Customs Steamer" will be received up to noon of the

Second Day of September. 1912.

for the construction of a Twin-screw Steel Steamer for Customs Service on the Atlantic Coast, to be delivered at the port of Quebec, of the following leading dimensions, namely: Length, between perpendiculars, 185 feet; breadth, 32 feet; draught, 10 feet 6 inches; and speed, 15 knots per hour.

Plans and specifications of this steamer can be seen at the Department of Customs, Ottawa, and at the offices of the Collectors of Customs, Toronto, Collingwood, Montreal, Quebec, St. John, N.B., and Halifax, N.S.

Plans and specifications can be procured upon application to the Commissioner, Department of Customs, Ottawa.

Each tender must be accompanied by an accepted bank cheque in favor of the Commissioner of Customs, equal to ten per cent. of the whole amount of the tender, which cheque will be forfeited if the successful tenderer declines to enter into a contract with the Department, or fails to complete the steamer.

Cheques accompanying unsuccessful tenders will be returned.

The Department does not bind itself to accept the lowest or any tender.

Newspapers copying this advertisement without authority from the Department will not be paid.

JOHN MCDUGALD,
Commissioner of Customs.

Department of Customs,
Ottawa, 19 July, 1912.

-26162

Department of Railways and Canals, Canada

HUDSON BAY RAILWAY.

NOTICE TO CONTRACTORS.

Sealed Tenders, addressed to the undersigned and endorsed "Tender for construction of The Hudson Bay Railway," will be received at this office until 16 o'clock, Thursday the 12th of September, 1912, for the section from Split Lake Junction to the Hudson Bay terminus.

Plans and profiles showing the character and extent of the work to be done, the specifications and form of contract to be entered into and other information can be seen on and after Thursday the 15th of August at the office of the Chief Engineer of the Department of Railways and Canals, Ottawa, and at the office of the Chief Engineer of the Hudson Bay Railway, Winnipeg, at which places forms of tender may be obtained.

Separate tenders will be required covering the work enumerated in the schedule on the section from Split Lake Junction to Port Nelson, a distance of approximately 165 miles and on the section from Split Lake Junction to Port Churchill, a distance of approximately 245 miles.

The successful tenderer will be required to sign a contract covering the work from Split Lake Junction to the terminus selected and which will be announced by the Hon. Minister of Railways and Canals on his return from Hudson Bay.

Parties tendering will be required to accept the fair wages schedule prepared or to be prepared by the Department of Labor, which schedule will form part of the contract.

Contractors are requested to bear in mind that tenders will not be considered, unless made strictly in accordance with the printed forms, and in the case of firms, unless there are attached the actual signature, the nature of the occupation, and place of residence of each member of the firm.

An accepted bank cheque for the sum of \$150,000.00, made payable to the order of the Minister of Railways and Canals, must accompany each tender, which sum will be forfeited if the party tendering declines entering into contract for the work, at the rates stated in the offer submitted.

The cheque thus sent in will be returned to the respective contractors whose tenders are not accepted.

The cheque of the successful tenderer will be held as security, or part security, for the due fulfilment of the contract to be entered into.

The lowest or any tender not necessarily accepted.

By order,

L. K. JONES,
Asst. Deputy Minister and Secretary.

Department of Railways and Canals,
Ottawa, August 14, 1912.

Newspapers inserting this advertisement without authority from the Department will not be paid for it.—271.24.

Canadian Pacific Railway Company.

Issue of \$18,000,000 Ordinary Capital Stock.

SPECIAL INTEREST PAYMENT.

As intimated in the President's circular to the Shareholders, dated January 3rd, 1912, an interest payment at 7% of \$3.18 per share, will be paid on October 15th next, on the first four instalments (\$120) from the due date of each instalment to September 30th, 1912, on the shares of the above new issue represented by the certificate of subscription, to holders of record at close of business, August 16th next, who have paid these instalments on or before their respective due dates. Notice is hereby given that this interest payment will be mailed from New York to the registered addresses of holders, or their duly appointed attorneys, on October 14th, 1912. For the purpose of this payment the certificate of subscription books will close August 16th at 3 p.m., and reopen September 16th, 1912.

W. R. BAKER.

Secretary.

Montreal, July 31st, 1912.

CANADIAN PACIFIC RAILWAY COMPANY.

Notice to Shareholders.

The Thirty-first Annual General Meeting of the Shareholders of this Company, for the election of Directors to take the places of the retiring Directors, and for the transaction of business generally, will be held on Wednesday, the second day of October, next, at the principal office of the Company, at Montreal, at Twelve o'clock, noon.

SPECIAL MEETING.

The Meeting will be made Special for the purpose of authorizing the issue of Consolidated Debenture Stock of the Company to acquire the outstanding securities of the Dominion Atlantic Railway Company and also for the purpose of considering, and, if approved, of authorizing an increase of the present authorized Ordinary Capital Stock of the Company, by an amount not exceeding \$60,000,000 for the purposes of the Company, such increase of Stock to be issued according to the requirements of the Company and as may be determined by the Directors, and of adopting such Resolution or By-law as may be deemed necessary in connection therewith in order to enable the Directors to give effect thereto.

The Common Stock Transfer Books will be closed in Montreal, New York and London at 1 p.m., on Saturday, the thirty-first day of August. The Preference Stock Books will be closed in London at the same time.

All books will be re-opened on Thursday, the third day of October.

By order of the Board,

W. R. BAKER,

Secretary.

Montreal, August 12th, 1912.

THE CANADIAN PACIFIC RAILWAY COMPANY.

Dividend Notice.

At a meeting of the Board of Directors held this day, the following dividends were declared:—

On the Preference Stock, two per cent. for the half year ended 30th June last.

On the Common Stock, two and one-half per cent. for the quarter ended 30th June last, being at the rate of seven per cent. per annum from revenue and three per cent. per

annum from interest on the proceeds of land sales and from other extraneous assets.

Both dividends will be paid on 1st October to Shareholders of record at the closing of the books in Montreal, New York, and London, at 1.00 p.m., on Saturday, 31st August next.

All books will be re-opened on Thursday, 3rd October next.

By order of the Board,

W. R. BAKER,

Secretary.

Montreal, 12th August, 1912.

Our Patents Protect You

as well as ourselves against imitations, (always inferior to the genuine).
Our Canadian Patents, Nos. 131345, 131346, 131624 and 131625 cover the distinctive features that put

Standard ^{D.O.A.}_{D.S.} Cable Terminals

in a class by themselves as regards high quality and economical prices.

Write for complete information.

Standard Underground Cable Co., of Canada, Ltd.
Department C. **Hamilton, Ont.**

Manufacturers of Electric Wires and Cables of all kinds.

EDISON BSCCO

PRIMARY BATTERY

The Standard Closed Circuit Cell

Clean cut service, so essential to the successful operation of a railway signal system, renders the practice of experimenting on any of its component parts, with material other than of the highest grade or proven worth, a somewhat questionable venture.

The system must give clean cut information, leaving no doubt in the mind of the man observing the indication as to just exactly what is meant. Its efficiency must be high, this being necessary to win confidence and respect of the engineman.

An unnecessary stop due to a signal failure with its wear and tear on equipment, waste of fuel and disarrangement of schedule are results that tend to place the department responsible in anything but a favorable light. It is not surprising, therefore, that failures occupy the place they do in the estimation of the signalman.

The source of current, if not absolutely reliable, is apt to cause the signal engineer serious concern. The requirements are severe, and unless the battery is designed correctly, made of the finest material, and in the most approved manner, it will not stand up under the strain.

This explains why EDISON-BSCCO cells are used so generally in signal work. They have proven their worth, and the results obtained have justified the unceasing efforts made to have every cell or element that goes out from the works as nearly perfect as scientific methods and high grade material will produce.

Their adoption not only eliminates the worry incidental to battery trouble, but assists through efficient service in keeping operating expenses down where they belong.

**The cheapest form of
battery energy.**

Synopsis of Dominion Land Regulations.

Any person who is the sole head of a family, or any male over 18 years old, may homestead a quarter section of available Dominion land in Manitoba, Saskatchewan or Alberta. The applicant must appear in person at the Dominion Lands Agency or Sub-agency for the district. Entry by proxy may be made at any agency, on certain conditions by father, mother, son, daughter, brother or sister of intending homesteader.

Duties.—Six months' residence upon and cultivation of the land in each of three years. A homesteader may live within nine miles of his homestead on a farm of at least 80 acres solely owned and occupied by him or by his father, mother, son, daughter, brother or sister.

In certain districts a homesteader in good standing may pre-empt a quarter-section alongside his homestead. Price, \$3.00 per acre.

Duties.—Must reside upon the homestead or pre-emption six months in each of six years from date of homestead entry (including the time required to earn homestead patent) and cultivate fifty acres extra.

A homesteader who has exhausted his homestead right and cannot obtain a preemption may enter for a purchased homestead in certain districts. Price, \$3.00 per acre. **Duties.**—Must reside six months in each of three years, cultivate fifty acres and erect a house worth \$300.00.

W. W. CORY,

Deputy of the Minister of the Interior.

N.B.—Unauthorized publication of this advertisement will not be paid for.

No. 17

Ramapo Automatic Safety Switch Stands

This style is especially adapted for main line use. The handle is at the best height for facility of operation.

This stand measures 33 in. from top of handle to top of base fixtures and is furnished preferably with enameled target at such height, and of such shape as may be desired.

YOU Need This Railroad Library

—a library that will give you the best up-to-date modern practice. There is no other reference work in the world that so completely meets the needs of the railroad man as the INTERNATIONAL RAILROAD LIBRARY. This is an epitome of the years of experience of the best railroad experts in the country edited in a style that 18 years of experience in publishing home-study textbooks has proved the easiest to learn, to remember, and to apply. The volumes of this library are a part of a series of textbooks that cost \$1,500,000 to prepare. They are recommended by the highest authorities and are used in nearly all our leading universities and colleges. Not only can they be used to great advantage by superintendents, railroad officials, foremen, engineers, firemen, conductors, and brakemen as an authoritative guide in their work, but since they can be so clearly understood even by persons having no knowledge of higher mathematics, they can be used by all classes of railroad employes that are desirous of advancing to higher positions. Write for catalog now.

INTERNATIONAL TEXTBOOK COMPANY

BRADSTREET'S

Capital and Surplus, \$1,600,000.

Offices throughout the Civilized World.

Executive Offices:

NOS. 346 and 348 BROADWAY,
N.Y. CITY, U.S.A.

The Bradstreet Company gathers information that reflects the financial condition and the controlling circumstances of every seeker of mercantile credit. Its business may be defined as of the merchants, by the merchants, for the merchants. In procuring, verifying and promulgating information, no effort is spared, and no reasonable expense considered too great, that the results may justify its claim as an authority on all matters affecting commercial affairs and mercantile credit. Its offices and connections have been steadily extended, and it furnishes information concerning mercantile persons throughout the civilized world.

Subscriptions are based on the service furnished, and are available only by reputable wholesale, jobbing and manufacturing concerns, and by responsible and worthy financial, fiduciary and business corporations. Specific terms may be obtained by addressing the Company at any of its offices.

Correspondence Invited.

PROFESSIONAL CARDS.

THE RAILWAY AND MARINE WORLD is especially adapted for the publication of professional cards of engineers, inspectors, analysts, electrical experts, naval, grain elevator and other architects, solicitors, etc., who desire to bring themselves under the notice of the management and officials of the various steam and electric railway, steamship, grain elevator, telegraph, telephone and power companies throughout Canada, as well as the locomotive, car and shipbuilders, contractors and promoters of railway enterprises. THE RAILWAY AND MARINE WORLD is the only medium through which all these important classes can be reached.

Rates will be quoted on application.

**Your Repair Costs
Can Be Kept Down**

We do not say this from our point of view, but we know it from the many experiences that we have encountered within the past years, welding broken Rudder-Posts, Stern-wheel Shafts and many other heavy sections of wrought iron and steel, for the largest Steamship Companies of the world.

**Repairs are Made
Quickly and Permanently**

That is why "Thermit Welding" keeps down repair costs first because no time or money is wasted in delay and second because "Thermit" makes a good weld that will last.

If you will make a "Thermit" part of your repair equipment, you will effect a saving of many hundreds of dollars in your repair costs.

Our process of welding has received the sanction of the British Corporation for the Survey and Registry of Shipping, Glasgow.

Write for our Pamphlet "25-N and "Reactions", they tell what we are doing for others.

NEW 8-FEED DETROIT LUBRICATORS

CANADIAN DETROIT LUBRICATOR COMPANY, LTD.
WINDSOR, ONT.

The new 8-feed Detroit Locomotive Lubricator is used on superheater Mallet compound locomotives. The six outside feeds lead to the high pressure steam chests, the high pressure cylinders and the low pressure steam chests. The two middle feeds can be used for two air pumps, or for one pump and an intercepting valve or for one pump and a mechanical stoker. A half turn of the oil control valve permits of all the feeds being started or stopped instantly without disturbing the adjustment of the feed regulating valves. A quarter turn cuts off all but the two middle feeds. The new Detroit Locomotive Lubricators give greater oil mileage, easier control and better lubrication than any other lubricators on the market. Our circular tells why.

Sales Agents, Taylor & Arnold, Limited, Montreal.

Traders Bank Building

On construction work you should use a machine that will be busy all the time, because an idle machine means a loss in money.

THE BROWNHOIST LOCOMOTIVE CRANE

Can be kept busy all the time from the beginning to the end on any construction work—because it can be used for excavating with grab or drag-line bucket; handling sand, gravel, stone, etc., with grab bucket or skips; drive piling and sheeting with either steam pile-driver or drop-hammer; place the concrete in elevated forms or in trenches; pull piling and sheeting; place the backfill; switch the cars; and all the miscellaneous hoisting work.

These Cranes are self-propelled; made in various capacities; eight and four-wheel; and with either steam, electric, or gas engine drive.

Our Catalogs I and K show how and where the Crane is used. Write for these Catalogs.

Westinghouse ^{Belt-Driven} Air Compressors

THE adaptation of our air brake types of air compressors for general commercial purposes was so successful, and the demand for them covered so broad a field of application, that we found it necessary to provide a line of belt-driven compressors for cases where the only power available is from shafting, or it is inexpedient to employ either steam or electric power.

The Westinghouse Type F Compressor, illustrated, is similar in all respects to our motor-driven compressor, except that a belt wheel is placed directly on the end of the crank shaft. It is designed to be controlled by an automatic governor, and is, therefore, adaptable to any kind of service, where steam or electric power is not available.

TITANIUM RAILS WIN OUT ON BOSTON ELEVATED

The service on the Boston Elevated is said to be the severest in the world. Note how test proved superior durability of open-hearth Titanium rails laid alternately with plain open-hearth rails.

CONDITIONS OF TEST

All rails A.S.C.E. Section 85
lbs per yard.

Laid April 1st, 1911.

Measured October 31st, 1911.

In service when measured, 214 days

Average wear in square inch (for all rails)

	Open-Hearth	Titanium Open Hearth
In 214 days	.755	.537
Per 1,000,000 tons	.0686	.0488

Test rails laid alternately on
high side of track.

Radius of curve, 100 feet.

Grade, 5 per cent. down.

Track elevation, 3 inches.

Ratio of Wear

For all Rails

Titanium to Open-hearth

1 to 1.41

Titanium rails cost only about \$2 more per ton than untreated rails. When you order, specify that our men shall look after the Titanium addition. On this condition we will make no charge for their services.

TESTS ON SOME OTHER ROADS

Boston & Maine 55 p.c. to 186 p.c. . . in favor of Titanium Rails.

(Showing that as the trial continues, the figures improve in favor of Titanium as evidenced by previous measurements already published.)

Lehigh Valley 54 p.c. . . in favor of Titanium Rails.

Baltimore & Ohio 56 p.c. . . in favor of Titanium Rails.

Booklet No. 22 explains in detail the superiority of Titanium-treated iron and steel. Rail diagrams of above tests gladly sent on request.

Output of Titanium Steel in 1910 was 326,300 gross tons.

Output of Titanium Steel in 1911 increased to 410,600 gross tons.

C. G. E. Gas Electric Cars

The Gas Electric Car

Electricity is the silent and efficient transmission link, furnishing, power and brilliant illumination.

Is materially reducing operating costs and increasing traffic on branch railway lines wherever used.

The records of thousands of miles of operation in actual service prove the usefulness and reliability of this car.

Built as a Railroad Proposition

Strong, reliable, efficient and attractive. M. C. B. throughout. Just as the trolley car successfully displaced the horse car, so with equal success and profit the C. G. E. Gas Car is now replacing branch line trains.

Catalogue 4855 illustrates and describes the equipment and shows many car body designs. This will be sent you by return mail for the asking.

Power Cost

is of Prime Importance
in every factory.

We can positively demonstrate to **your** satisfaction that we can give you a 100% investment---Can prove it in dollars and cents.

It is actually possible to save 60% per h.p. per year with a Bowser Oil Filtration and Circulating System.

Just a "nod" from you will bring the proof and it will incur no obligation.

Note The Formula

We give above the proper comparative basis on which to consider oiling systems. In this day every engineer or manager wants to know what he is buying. Don't accept somebody's statement that an oiling system will do certain things—Use the formula above and figure it out for yourself. Cut out the tables and file for reference.

When you buy a boiler you demand the amount of heating surface—On the same basis of reasoning, why not demand the amount of filtering surface in an oiling system?

The Bowser Oil Filtration and Circulating System

possesses the following exclusive features which account for its superiority:

Continuous Operation--10 to 15 hours' Oil Supply at all times.
Easily Accessible for Cleaning.
Less Floor Space proportionate to filtering Surface.
Oil level in Gravity Tank Automatically Maintained.
Inspected and Cleaned without shutting down.

Sediment Trays and Screen Arrangements remove heavier impurities before final filtering, permitting finer filtering material.

All Tanks free from pressure.

Three sq. ft. Filtering Surface for Each Gallon of Oil per hour to be filtered.

Water automatically expelled.

Here's another reason for Bowser service and success: Our corps of engineers is ready to look over your plant and give expert advice, not only on a proper oiling system, but on other arrangements as well, that will improve your service and cut your cost. This special service is gratis, and does not obligate the enquirer in any way. All we want to know is that you are interested in reducing the cost of your power and engine room maintenance.

Ask for Catalogue No. 18.

A Perfect Cab Signal System !

THE SIMMEN SYSTEM

Approved by the Railroad Commission of the State of Indiana
for Use in That State.

The Simmen System of Railway Signalling and Train Despatching is a cab signal system of remarkable simplicity, which has been proved successful at the highest speeds and under all possible weather conditions. All the advantages inherent in cab signal systems are fully realized in combination with an efficiency of the highest order. Visible light signals in the cab "Clear" or "Danger," as the case may be, are continuous and positive, and the changes from one to the other vivid and unmistakable. The risk of missing fixed signals on the roadway in fog or snow-storm is entirely obviated. Consequences of oversight thoroughly guarded against. Head-on collisions are prevented by interlocking of automatic electric switches on the Despatcher's table, and stop signals are displayed at a safe distance from sidings.

False "Clear" signals are an impossibility, since any derangement of any circuit automatically causes the display of a red light. Third (contact) rails at every siding permit of telephone communication between cab of engine and Despatcher's office. Cost of installation much less than that of other systems and cost of maintenance practically nominal.

Despatcher's Table

Full particulars and descriptive matter on application to

The Advantages of the **EDISON STORAGE BATTERY**

For Axle Train Lighting Systems

The peculiarities of the axle generator system of train lighting, due to the necessities of transportation, are such that a storage battery is manipulated in anything but a normal manner. Sulphation, buckling, failure through overcharge, and rapid deterioration through idleness, when partially discharged, are factors which militate against the life and usefulness of the lead cell with this system.

Sulphation, for example, causes high voltage indications, rendering the automatic features of modern axle lighting systems inoperative at such times as would give false indications of fully charged batteries.

The Edison battery will retain its original capacity no matter how the output of the axle generator fluctuates or how quick the rate of discharge, and it will remain in a discharged condition for an unlimited length of time without any deterioration. Unlike the lead cell, Edison plates have the same dimensions from the time they are put into service to the end of their useful life.

The great physical strength of Edison battery construction enables it to resist continued vibration and concussion.

Saving in weight for the same ampere hour capacity is another big advantage of the Edison battery for every type of train lighting system. The amount of money saved in haulage costs alone would establish the economy of this battery for train lighting, even if it did not possess a single one of the notable advantages mentioned above. On a 32 volt system, this battery saves one ton per installation. This annually amounts to 108,000 ton miles per car.

Send for our newest bulletin, No. 1018, "Edison Train Lighting Batteries."

THE ROYAL LINE

MONTREAL QUEBEC BRISTOL

ROYAL GEORGE and ROYAL EDWARD

Their equipment and interior appointments are of the most luxur-
ious and modern description, and all the conveniences and comforts
that make for an enjoyable voyage have been thoroughly anticipated.
Marconi wireless, deep sea telephones, passenger elevators, thermo-
tank system of ventilation, superbly appointed cabins.

For full particulars apply to the nearest Railway or Steamship Agent or to the
following General Agencies.

123 Hollis St., Halifax, N.S., 226-30 St. James St., Montreal, Que., Can. Nor.
Bldg., Toronto, Ont., 272 Main St. Winnipeg, Man.

GEO. H. SHAW, General Traffic Manager, Toronto, Ont.

A supply man contends that one flaw in the construction of our brake shoe is that the narrow steel lug of the shoe wears out the cast iron lugs of the brake-head.

The weight and lateral pressure on the shoe due to the rotation of the wheels is taken only by the feet of the brake-head which bear against either end of the shoe. The centre lugs of the brake-head serve only to lock the shoe on and transmit the braking pressure to the shoe. The steel lug of the shoe does not bear on the brake-head.

McAvity Improved Standpipe

Type G.

The McAvity Type G Standpipe, by its greater range of drop pipe, meets all requirements where different heights of tenders are in service. It is a combination of the Standard Sheffield Valve with carefully designed upper works. The telescopic delivery spout excels all other such arrangements in strength, simplicity and convenience in operating.

As there is no internal mechanism whatever in the McAvity Type G Standpipe, it is adapted for use in the coldest climate. Looks automatically and positively parallel with track when not in use.

Will revolve in complete circle. Operated by one man. Self-draining; cannot freeze. It is equipped with an automatic relief valve and water hammer is eliminated.

Why the C. P. R. North Toronto Route to Ottawa and Montreal is the Logical One

The train leaves as follows:

Leave North Parkdale	- - -	9.15 p.m.	Arrive Ottawa, 6.50 a.m.
Leave West Toronto	- . -	9.30 p.m.	Arrive Montreal, 7.00 a.m.
Arrive North Toronto	- - -	9.40 p.m.	Daily
Leave North Toronto	- - -	10.00 p.m.	Will Stop at Westmount

Electric Lighted Compartment Cars and Standard Sleepers for both points.

- ☐ The North Toronto route is over an hour faster and overcomes a long hill climb for the train out of Toronto, obviating any inconvenience and ensuring early arrival at Montreal and Ottawa.
- ☐ The roadbed has been improved till it is unexcelled in Canada.
- ☐ The equipment is "Canadian Pacific Standard," a synonym for the "best" and attentive porters, ensure efficient service.

For Sleeping Car Space, Tickets, etc., Apply---

Toronto City Office : 16 King St. East, North Toronto Station, King Edward Hotel, West Toronto Station, or write M. G. Murphy, Dist. Passr. Agent, Toronto.

ADDITIONAL SAFETY AND ECONOMY IN TRACK MAINTENANCE

has been proved by the use of Continuous Weber and Wolhaupter base-supported rail joints—after fifteen (15) years' service, having a record of over **50,000 miles in use**—the extent of which is evidence of their excellence. Made in Canada.

The Construction of a Steel Centre Sill Wooden Box Car at the C.P.R. Angus Shops.

By Frederick H. Moody, B. A. Sc.

Very few of the many people engaged in railway business have any inside information of the steps involved in the production of rolling stock in large quantities, most of the information generally at hand being that which deals with the repair of cars, and the general carpenter work incidental thereto. The production of cars by the hundreds is an entirely different proposition, involving different methods of preparation and assembly to those entering into the repair of cars or their production in small quantities. Everything is handled on such a large scale as to make the two conditions almost entirely foreign to each other. For that reason, and feeling that there is a desire for information of the methods used by the larger builders in the construction of cars, the article here presented was undertaken. As typical in many particulars of the practice of the large

the C.P.R. having several thousands now in operation.

THE TRUCK. Nearly all the parts entering into the construction of the car are made right in the works, very little of the material being purchased outside. In other words, the plant is practically complete in itself. The trucks are no exception, other than the bolsters, both truck and body.

The arrangement of the shops for the expeditious handling of the material in its passage through them in the course of manufacture and assembly is particularly worthy of note. The wheel foundry is located in a building to the rear of the truck shop, and from that building the wheels are taken to the rear end of the truck shop for machining. The casting of the cast iron wheels is such a familiar process that no particular description will be given

couple of wheel presses for the mounting of the wheels on the axles in the usual manner familiar to all. From that point, the wheels are run on to a through track running the length of the shop, each mounted wheel being run down this track as assembled. The length of the track provides ample storage capacity for any fluctuations in the rapidity with which the wheels are drawn off, and also when the wheels are mounted more slowly than usual.

Near the front of the shop, the awaiting axles of the mounted wheels have the axle boxes slipped over the ends, a whole batch being so mounted at one time by an operator going up one side and down the other, the boxes being piled up on each side of the track in a convenient manner. These boxes are first of all assembled with the dirt collar, etc., on the inner end, and are all ready for assembling at this stage.

Fig. 1.—C.P.R. Steel Centre Sill Wooden Box Car.

Fig. 2.—First Step in Car Truck Assembling.

builders, and at the same time a process unique in itself, the methods employed at the Canadian Pacific Ry. Angus shops, Montreal, have been selected for the matter of description. The methods involved have been advanced to a very high degree of efficiency, and it is doubtful if there are any companies which can produce as high a grade of car more expeditiously than is possible in these shops. On four tracks, it is regular practice to turn out 40 cars a day of the type under discussion here, viz.: the steel centre sill wooden box car, large numbers of which have been added to the company's rolling stock during the last two years.

This car is constructed entirely of wood throughout, except for a steel centre sill, around which the car is constructed. This is a type of construction that has become fairly common on the bigger roads recently. The kind used by the C.P.R. is slightly different from those commonly to be found, the individuality of the designers entering into the construction to a certain degree. The car here considered is shown in fig. 1,

of the process, the steps of the manufacture being taken up at the point where the cast wheels are delivered to the truck shop. At the rear of this shop there are several wheel boring mills, where the hubs are bored out to a standard gauge, and the process and movements on the parts of the operatives have been developed to such a degree that the cost of machining the wheels is reduced to a remarkably small figure. The axles are also turned down to the required dimensions in the same place, which is equipped with special axle turning lathes, and the same points regarding the cost of production may be here emphasized as well. It may be pointed out, however, that while the cost of production is remarkably low, the quality of the output has in no way been reduced, as the processes have been refined to such a degree, and the operatives are so familiarized with the steps involved, from the regularity of their employment on this class of work alone, that the quality is maintained with decreased operating expenses.

In the same part of the shop, there are a

Pairs of these wheels are next rolled along the track in the same direction to the position shown in fig. 2. To the left, on the other side of the assembling track, there is kept a pile of arch bars. On the other side of the track in fig. 2, there will also be noticed a pile of bearing brasses conveniently located to the assembling point. Into the axle boxes previously mounted on the axle ends, a journal brass is slipped into position, one in each. When two wheels are thus equipped, an arch bar is placed across between as in the illustration, in the correct position for finally bolting together, thereby assembling the wheels in the correct relation to each other. On top of each of the axle boxes, there are also placed two bolts of the required length, for convenience in the final fitting up. These bolts are obtained by the assemblers from bins conveniently located alongside the assembling track.

Two truck skeleton frames thus loosely thrown together are then run further on down the track to the point shown in fig. 3, where they are further added to by the

addition of the spring plank with the columns attached thereto. These spring planks may be noticed to the rear in fig. 3, where a small pile is kept for the operators, being constantly replenished from the rear of the shop, where the columns are rivetted to the spring plank, by a gang whose duty it is to see that the assemblers are provided at all times with all the necessary material to proceed with the work without delay. The spring plank, on being lowered into place by the jib crane to the rear, is fitted with the spring equipment between the columns

long enough for two trucks when there is a large gang operating at one time. At the same time as the truck bolts on both sides are being tightened up, the brake rigging members that belong to the truck are being put in position on the truck, so that on leaving this point, the truck in itself is entirely completed. Passing a little further along the shop, the body bolster is located over the truck bolster from the awaiting pile of these members near the door of the building. There is a swinging jib crane at this point for this purpose.

ging. The draft springs are temporarily bolted together between their end plates, and dropped into position in the coupler yoke. The coupler is then rivetted in, and the cover plate rivetted down over all as shown to the left in the illustration. Both ends are similarly equipped at the one setting, when the centre sill is ready for assembly into the car.

UNDERFRAMING. All the wooden parts entering into the assembly of the car are machined in the shop across the midway from the car shop, beyond the point of

Fig. 3.—Second Step in Car Truck Assembling.

Fig. 4.—Final Step in Car Truck Assembling.

at each end. This consists first of all of a couple of pieces of hard wood placed on the spring plank, on top of which is the four coil spring with guiding cap over top, carrying two rollers.

Passing the truck thus far assembled a little further along, places it in the position to the left in fig. 4, where the truck bolster is lowered into position on the truck between the guides. These truck bolsters are also kept in piles alongside of the track, as shown to the rear in this illustration, within range of the same jib crane used in the last operation of placing in position the

STEEL CENTRE SILL. The buildings which comprise the Angus shops are located along both sides of a central midway, which runs through the works. The truck shop is on the west side of the midway, with the freight car shop alongside. The blacksmith shop is across the midway from the truck shop, and located in the opposite direction from the car shop. It is at the rear of this blacksmith shop, in a small lean-to, that the steel centre sills are fabricated from the structural shapes that enter into their make-up. The constructional work on these is of the usual form, with the custom-

assembly of the sills shown in fig. 5. Alongside of this place is the point of assembly of the steel centre sill to the two trucks. There are two tracks for this operation, the process being carried on concurrently on both tracks. The trucks' from the truck shop are run out on to turntables in a track running the length of the midway, run along this track, and by two other turntables can be run across to either of the tracks for the assembly of the sill to the trucks.

Between the two assembly tracks, as indicated in fig. 6, there is a pile of wooden

Fig. 5.—Fitting Draft Gear into Centre Sill.

Fig. 6.—Rivetting Centre Sill to Body Bolster.

spring plank on the truck. In the same position, the upper arch bar is placed in position from the store pile to the rear. With all these parts assembled, the column bolts are slipped into position in the column bolt holes, and the truck is then ready to be moved along to the position to the right in fig. 4, where the bolts on both sides of the truck are tightened up over spring washers by the operator. It will be noticed that along both sides of the track, there is a depressed channel, on the edge of which the operator can conveniently sit while tightening up the bolts. This channel is

any flangers, punchers, rivetters, etc. The sills as there produced are shown in fig. 5 to the right, in the row lying on the ground.

The sills shown in fig. 5 are on a tract of ground across the midway from the car shop. To the right of the midway crane column in this illustration, there is kept a store of steel centre sills from the shop at the rear of the blacksmith shop, from which the few shown on the ground are drawn by means of a steam yard crane operating on the industrial track to be seen in the lower right hand corner of fig. 5. Here the sills are equipped with the necessary draft rig-

side sills completely machined ready for assembling. On to two trucks located the proper distance apart, two of these side sills are dropped, the body bolster fitting into the notches in the lower face of the side sill, correctly aligning the car trucks, and squaring the body bolsters with regard to each other. When the trucks and body bolsters are thus squared up with regard to each other, the steel centre sill is placed in position on the two trucks, and the rivet holes aligned. Both ends are then rivetted to the body bolsters, making a perfect and permanent alignment of the underframing.

The trucks thus located with regard to each other, and with the two wooden side sills resting loosely on the body bolsters, the whole is pushed across the midway into the position shown in fig. 7, in the car shop, where the balance of the underframing is put into position. Along this same track in the building, there is a long row of cars in different stages of advancement, so, in order to have them all pass through the shop uniformly, they are all connected together by chains or other connecting links at the couplers, so that between the different steps, the row moves forward one car length, leaving space for the entry of this skeleton car composed of trucks and centre sill.

THE BOTTOMING is the first operation in the series through which the car passes in working down the shop. There are seven men working on this operation, working together when required, and independently on the smaller parts. Everything runs as by clock work, every man knowing exactly what is expected of him. Very little fitting of any of the wooden members is required, as the machining in the wood-working department takes care of all fitting parts except in such places as it is more convenient or quicker to do the fitting right on the job.

The first step is the fitting of the side sills, which are resting loosely on the body

steel centre sill are also placed. These are for the nailing of the decking.

The truss rods, bent in the shop in the manner described in Canadian Railway and Marine World, of Dec., 1911, are then slipped into position through the holes in the end sills, and after locating on the truss rod posts and under the queen posts, have the turnbuckles attached, and the end washers and nut screwed on, the outer truss rods being then tightened up, the inner ones not being tightened up at this stage, as the end timber has as yet to be added at a latter period in the car construction.

At this point in the proceedings, one of the workmen leaves the general work to assemble the air cylinder to its supporting frame preparatory to fitting to the needle beams as described. Another of the workmen, while the frame is being tightened up at all points, goes over the top surface of the frame thus far assembled, with a paint brush on the end of a stick, covering all the upper surfaces with a coating of red paint, thereby protecting the contact surfaces between the frame and the decking. It might again be emphasized that all the fittings and parts for the car are kept conveniently located to the assembling point at all the stages of erection. At this point, the fittings are kept in the row of bins in the rear in fig. 7, while the members are located in piles alongside of the assembling point.

located squarely across the car and nailed. Working in both directions from this central plank, the balance is laid, the workmen nailing down every third or fourth plank in the edge at the matched strip. The planking is made to fit over any protruding bolt heads in the sills, by chopping out a recess in the lower face. The rest of the base castings for the superstructure framing are also located, and special length decking fitted around. The decking at the centre is slightly longer than that in the body of the car, from the fact that the door spaces are located there.

The decking having been nailed along the intermediate sills on every third or fourth plank, and this operation completed for some distance on each side of the centre, a workman follows along the different sills, driving in nails a short distance as in fig. 8, until they have been placed in each plank the length of the car. This workman then goes over the same nails with a light sledge, driving them home with a single blow. Thus every movement is made to count, and the planking is laid with the least possible amount of labor in the most expeditious manner.

SUPERSTRUCTURE. The most spectacular part of the car construction operation is the erection of the superstructure framing. While the last nails of the decking are being driven home, the train of cars

Fig. 7.—Assembling Car Underframing.

Fig. 8.—Decking Car Top.

bolsters from the locating work they were called upon to perform in the yard. While recessed at the points where they rest on the body bolsters, cavities must be chopped in the bottom of the recesses for the sills to rest evenly over the rivets of the bolster. The side sills are then bolted to the bolsters through the base caps of the superstructure bracing, shown in fig. 7. At the same time, the four truss rod saddles are located on the bolster and bolted in place, and the same operation performed with the queen posts on the needle beams, the latter being then bolted to the side sills. The air cylinder on its supporting framework is then swung up into position under the needle beams, and bolted thereto.

The ends of the side sills, which have previously been tenoned in one direction only, have part of this tenon cut off to fit into the mortise of the end sills, which are loosely put in place. At the same time, the end bumper plate which goes between the end sill and the end of the steel centre sill, is slipped into position. The truck king pins are also dropped into place.

The framing is now ready to receive the wooden intermediate sills which are kept at hand in the pile to the right in the illustration. These are dropped in place and bolted close up against the outer truss rod posts. Similarly the lapping or strips laid on the

Between each pair of assembling tracks, there is a third track communicating directly with the wood-working shop across the midway, on which the stock is constantly replenished. Likewise the fittings, such as turnbuckles, end plates, etc., have limited stores in the bins mentioned, with greater stores outside the wall opposite the point where that particular part enters into the construction. The inside stores are replenished from time to time through doors located along this wall. Convenience is a strong point in the layout of this car building plant, and means a great deal towards the rapidity with which it is possible to turn out the cars.

DECKING. For the decking, the bottomed car is moved a car length further along the shop, a new gang taking up the work at this point, all the cars moving at the same time, each gang changing cars. Another car enters from the outside gang for the bottoming gang to commence operations upon.

The decking operation is shown in fig. 8. On it, seven men are engaged. As soon as the car is placed, the decking gang throw up on to the car from the pile to the right in fig. 8, sufficient decking to cover the car spacing it roughly along the length of the car. From a mark on the side sills at the centre of the car, the first deck plank is

is moved along another car length, and, at the same time, the workmen commence throwing on to the deck of the car the machined car belting rails, the work on which has been completed just previously, by an operator who attaches the upper bevel edges to the rail for the dislodgement of the grain for which the cars are constructed. The triangular shaped strip is nailed to the belting and sawn to the required lengths, and set aside ready to throw on the car as it is moved along the line. While the nailing of the decking is being completed, a workman from the superstructure gang goes over the deck surface and drills the diagonal and vertical holes through the decking for the small superstructure tie rods, completing the task before the car is ready to be moved along. The belting placed on the deck is located in pairs. The material for the superstructure diagonals is also placed on the deck in a convenient manner.

On the edges of the deck, the roof side plates are placed, and across the car on the deck between the side plates, the carlines are fitted with bolts at the ends across between the side plates lightly tightened up, and when tie bolts from the carlines through the side plates are located, all the bolts are tightened down carefully, making sure that the roof structure thus formed

is square. The ridge rail is also placed in position with the intermediate stringers.

While the latter members are being added to the roof frame, the corner and door posts are driven into the base castings, the roof frame having first of all been slipped to one side in order that the base castings might be exposed. Through the roof side plates, the tie rods are slipped by the workmen, leaving the roof structure and its fittings in the shape shown in fig. 9. It will be noticed in this illustration that there is an elevated platform near the level of

assembling of the roof frame and the putting together of the wall frame are carried out is nothing short of wonderful, and the observer is strongly reminded of the structures rapidly built up in the Arabian Nights.

SHEATHING AND ROOFING. The car now passes along one more stage in its path, when the sheathing of the sides is attended to. This is a simple task, as the matched lumber is prepared to length and only requires to be nailed on. This is followed by the addition of end ladders, previ-

ously assembled of the car near the roof are also added. This completes the car construction, and it is now ready for the finishing touches in the paint shop.

THE PAINT SHOP is at the extreme end of the erecting shop, through large corrugated fire doors. Here there is room for several cars in a row, where they are painted one after the other by means of the air brush. Needless to say, the air of this shop is a bright red from the atomized paint floating about in the atmosphere. But the job is performed very rapidly, and the re-

Fig. 9.—Raising Assembled Roof Frame.

Fig. 10.—Assembled Superstructure Framing.

the car roof, from which some of the assembling operations such as the driving of the posts are carried out.

The next step is to lift the roof structure at both ends by means of air hoists over both those points, resting the elevated structure on the tops of the awaiting posts, which have just previously been capped with end castings, similar to those used at the lower end. These fit recesses in the lower edge of the side plates. The diagonal bracing is also located in correct position as the roof is being located, thus forming a loose skeleton of the car frame. At

ously assembled on the side benches by a workman detailed for this specific purpose, followed by the end trussing and the mounting of the door and its fittings, the door having previously been made up in the wood working department and brought over in a completed state.

This is followed by the roofing, the first layer being an overlapping one of reinforced galvanized metal. This metal layer is supported on small strips resting on the stringers, and running from the ridge pole to the side plates as shown in fig. 11. Corrugations in the metal fit over these strips.

sulting work is said to be superior to hand brush painting, as the paint is made to penetrate into the pores of the wood and into all the crevices that could not be reached by the brush. Each car receives three coatings, with a several hour period intervening between each coat that it might penetrate and dry.

The car thus painted is taken out into the yard, where the lettering and numbering is attended to with stencils in the usual manner. Without any special waiting after the car is thus numbered and painted, it is hauled away to make room for more, so

Fig. 11.—Fitting on Galvanized Roofing.

Fig. 12.—Roof of Completed Car.

the same time, the horizontal tie rods that are to pass along the belt railing are slipped into place, and loosely tightened.

The different diagonals and posts being located and the roof lowered into position, the next step is to fit the belt railing into place on all four sides of the car. There are two rows along the four sides, tightly fitting into place, making of themselves a very solid structure of the car framing. The frame is finally completed to the appearance shown in fig. 10, by the tightening up of all the various tie bolts in the framing. The rapidity with which this

Over top of this, the matched lumber for the roof is laid.

FINAL TOUCHES. Passing the car down one more step, most of the final touches to it are made. These include the additional parts shown in the car in fig. 12, such as the centre runway on the car roof, brake standard and its attachments, and the grab irons on the roof. On the lower level, there is a further gang adding the end deadwood, and tightening the centre truss rods on to it, piping the car for the air, putting on the steps, and the other minor details that go to make the completed car. The

rapid is the rate of production, even though the yard space at the disposal of the builders is quite large.

The capacity of each track per day is 10 cars under normal conditions, so a good idea of the rate at which the work progresses may be gathered. The steps in the work are so mechanical, and the methods involved so well planned, that the workmen are not pushed beyond normal working. To watch the gradual evolution of the car is, to say the least, a most interesting sight, and it is very instructive.

Removing and Repairing a Wrecked Timber Truss Span on the C. N. R.

The clearing of a wrecked timber truss span and erection of a temporary structure, restoring traffic, was accomplished a short time ago in three days on the Canadian Northern Ry. at Saskatoon, Sask., where a derailed car demolished the north shore span of the bridge over the South Saskatchewan river. This bridge consists of six 150 ft. through Howe truss spans of timber on concrete piers, the rail elevation being about 45 ft. above the surface of the water. The bridge was of British Columbia fir in first class condition. It was built about six years ago.

As one of the southbound through passenger trains, carrying several sleeping cars on its rear end, was pulling through the south end of the yard at the approach to the bridge on March 4, the rear truck of the last sleeper left the rails at a switch about 500 ft. north of the bridge. The truck slewed and led off on the switch to the west or right hand side until the wheels that should have been on the left hand

The cable was then run down to the wreckage, dragging the tangled mass of rods and timber and the wrecked sleeper out of the way.

Reconstruction was started by first erecting a temporary trestle over which traffic could be opened. Bents were framed on the ice and raised by a wrecking crane working outward from the shore end, blocking being put under the bents. On account of the end of the second sleeper overhanging the adjacent span, it was necessary to build entirely from the shore, so that the crane could be used to lift the overhanging car. The last two bents next to the pier were framed at the side of the bridge, then lifted clear and swung into place. When all but one panel of the trestle was decked, the crane lifted the end of the hanging car and pushed it forward on the undamaged part of the bridge.

With traffic thus restored, work was continued on the erection of the permanent Howe truss span, utilizing the trestle for

A Temporary Cement Wash Protection for Bridge Timbers.

A temporary fire protection for old timbers on a steel bridge where the length of useful service had nearly been reached and the wood badly checked was recently provided on the Boston & Maine Rd. by a wash made up of Portland cement, plaster of Paris and sand. The bridge was a deck structure, located at such a distance from the station or houses where attention might be attracted by a fire burning on it, that some form of protection was considered advisable during the period of one or two years remaining in the life of the ties. There were wide and deep cracks in some of these ties, and as sufficient experience had not yet been had at that point with the use of fire-resisting paints to give assurance of their effective service, experiments were made in filling the cracks with various compositions, and also covering the entire top surface of the ties and guard rail.

The first experiment was with cement and water alone, but this plaster cracked

Wreckage of the Timber Truss.

rail were over a foot outside the right hand rail and beyond the guard timber. There was a 30 ft. approach trestle, but the wheels were hanging over the ends of the ties when this was reached, so the guard rails could have no effect. The sleeper was dragged in this position on to the bridge, sideswiping the truss and breaking or knocking out the posts and diagonals. This span collapsed completely, falling with the last car to the river bed below, which was almost dry and frozen to the bottom. The sleeper which went down is shown at B in the smaller of the two accompanying illustrations. The damage to the bridge did not extend beyond the first pier and the car preceding the one which wrecked the truss remained on the structure, having its rear badly damaged, however. Fifteen passengers were in the rear sleeper, and 12 were injured, but none fatally. A fire started in the wreckage, but was quickly put out by the city forces.

The wreckage of the truss and the car was cleared away with the aid of a Lidgerwood ballast unloader, which dragged it sideways off the bridge site. A track which runs west along the river bank at right angles to the bridge was utilized for this purpose, the Lidgerwood car being set at the point marked A on the photograph of the reconstruction.

Method of Clearing and Re-erecting the Span.

falsework. Additional posts were placed vertically on the end of each sill to carry the weight of the new span.

The nature of this accident was such that it was believed to be unpreventable by the guard rails, and it is also believed that a steel structure would have suffered similarly.

Steam Railway Fatalities.—During July, 24 employees were killed and 34 were injured, in the course of their work in connection with the operation of Canadian steam railways. Of the fatalities, six were due to being run over, four each to collisions and to derailments, three to falls, two each to falling material, and to being crushed between cars, and one each to being drowned, to being struck by a train, and to being shot. Of the non-fatal accidents, nine were due to being struck by trains, cars and light engines, eight to being run over, seven to collisions, six to derailments, three to falling material, two to scalding, and one each to being burnt, and being caught between rail and crossing plank.

The report that Mackenzie, Mann & Co. had offered the Government \$90,000 for Snake island, situated about three miles from Roche's point in Lake Simcoe, was denied by Sir Donald Mann, Sept. 4.

and came out of the cavities in the ties, so as to afford very little protection. A mixture of lime, cement and sand was then used on another portion of the bridge and was found to give better protection. Finally a mixture of cement, plaster of Paris and very fine sand was tried, this being mixed so thin that it would run in and fill all of the cracks in the ties and guard rails. It was washed over the entire surface of the timber.

This form of protection proved effective in stopping fires on the bridge for a number of months, but was considered only as a temporary expedient. The expense of the application was about the same as that for the application of a coating of fire-resisting paint, but the durability was considerably less than that of a paint. Since this work was done the fire-resisting paints have been investigated further and found to be sufficiently serviceable as a protection. They are believed to be preferable, where the protection is desired to last for any considerable period.

The experiments and observations in connection with the cement wash coatings outlined in the foregoing have been carried out under the direction of B. F. Pickering, Supervisor of Bridges and Buildings, Boston and Maine Railroad, at Salem, Mass.

Making Cattle Guards at the Grand Trunk Railway London Car Shops.

Under the direction of Geo. Powe, Foreman Woodworking Department, G.T.R. car shops, London, Ont., a series of jigs for the rapid machining and assembling of the component members of a G.T.R. standard cattle guard, has been developed, and will be illustrated and described herewith. A standard cattle guard of the narrowest size is shown in fig. 1. These guards are made in three sizes. The two commoner sizes are those which fit in between the two rails

the surface of the table, on the left side, where it is again seized by the first operator and passed through as in the first cut, completing that portion of the machining. It may be noted in passing that, on the far side of the saw, there is a vertical board clamped to the table at an angle to the saw, for the purpose of diverting off the table the wedge-shaped pieces that are scrapped by the saw. Otherwise, the saw might pick up these pieces and hurl them

throwing it back towards the operator.

The bar has next to be drilled to receive the three binding bolts. A horizontal drilling machine, rigged as in fig. 4, is employed for this operation. Secured to the drilling machine table, and at right angles to the drill spindle in the horizontal plane, there is an extension to support the bar while drilling and at the same time to locate the holes. This extension has a rear edge which guides the board and against which the operator keeps the bar pressed while machining. Hinged to this rear edge are three hinged stops (the one to the right not shown), against which the bars are held to locate the holes. In the illustration, the bar is held along against the first stop

Fig. 1.—Standard Narrow Size G.T.R. Cattle Guard.

Fig. 2.—Edging Top of Cattle Guard Bars.

and the mating ones for each side of a single track line. The third is the one used between the inner pair of tracks on a double track line. Large numbers of all sizes are made up at London, as that is the central point of a large mileage of both single and double track.

The first operation, illustrated in fig. 2, is that of edging the bars. The stock is placed in piles alongside of a rip saw, as shown in the right background in this illustration. On the rip saw table, to the left of the saw, there is secured a guide block,

back at the operator, with injurious results.

After the passage of a batch through this last operation, the saw is fitted up for the second or end bevelling operation. The machine as set up for this is shown in fig. 3. On the surface of the table, there is a small piece of board, tongued on the lower side to fit the groove of the table, along which it is guided. A counterweight, slung over the end of the table on a pulley attached thereto for the purpose, is attached to the rear end of the guide board to balance the weight of these moving parts and

while the operator is pulling the drill through from the rear. When this hole is drilled, the first hinged stop is swung up out of the way and the bar shoved along to the next or central stop, and the second hole drilled. This stop is then swung up out of the way and the bar located against the third and last hole. The holes in the bar are thus located exactly equidistant to each other, insuring against the holes not lining up properly in the final assembling. This drilling is quickly performed by a dextrous operator.

Fig. 3.—Bevelling Ends of Cattle Guard Bars.

Fig. 4.—Drilling Bolt Holes in Cattle Guard Bars.

into which the base of the bar fits, tilting the bar over into the path of the saw an amount sufficient to give the required bevel. The bar is kept over to the saw by the outer edge of the bar being guided on the guide block. The operator on the far end pushes the bar half-way through its cut, when it is seized by an assistant at the rear end and drawn through the balance of the cut. The guide is so set as to cause the saw to cut through half the width of the bar. The half-cut bar is returned along

relieve the operator of much of the arduous part of the work. At the proper angle on the top of the guide board, there is nailed a locating strip, against which the bevel of the bar is held while the cut is being taken. The operator takes the cut to the depth of the top bevelling, reverses the bar and repeats on the opposite end. No assistant is required in this part of the work. To the right of the saw, it will be noticed that there is a saw guard to prevent the saw lifting the severed part and

Next in order comes the drilling of the separating blocks, through which the clamping bolts pass. This operation is performed in the same drilling machine as the drilling of the bars, the separators having been cut off to length previously. These pieces, being small, permit of rapid handling, and in consequence a quicker method of using the machine than that employed in the previous instance is desirable. Carrying the work towards the drill, instead of the drill towards the work, seemed the best method

of accomplishing this, and the method of so doing is shown in the accompanying illustration, fig. 5. Clamped to the top of the drill table, there is a section of board covering the whole table top, and extending over the sides. The front of the board is lined up against the front edge of the table. On this board, there is a sliding wooden table, guided on the under part by a tongue fitting the groove of the latter, this tongue and groove being in line with the drill spindle. The separators are located on this movable platen up against the forward edge, located endwise against the pin shown. The drill spindle is located permanently in position, and the holes drilled by the operator forcing the upper carrying table towards the drill. Rapid operation is thus made possible, more so than if the drill spindle were moved up to the work.

Bevelling the edges is the next operation on the separating blocks, the rip saw being set up as in fig. 6 for this purpose. Parallel to the saw on the saw table, there is clamped a long board carrying a tongued upper surface, on which a carriage over top, with a grooved lower surface, is guided. In a recess on the upper surface of the carriage, the separator is located, and the carriage with contained separator run past the saw, trimming off the corner.

Fig. 5.—Drilling Bolt Holes in Separators.

Reversing the position of the separator on the carriage, the other end is trimmed down. On the near side, it will be noticed that there is a bevel strip, secured to the guide board to the rear, for deflecting the severed pieces from the saw and preventing injuries to the operator.

The wooden parts entering into the construction of the cattle guard being thus far completed in the machining, the parts are all taken to the assembling stand, as in fig. 7. Bolts from the screw department are piled conveniently under the assembling stand, and the separating blocks, in recesses in the upper surface. Against the edge to the right, which has a retaining shoulder, the first bar is located and three clamping bolts passed through. Then, alternately slipping separators and bars on to the projecting bolts, the guard is gradually built up. It will be noticed that there is a guiding surface under the points where the three bolts come, facilitating the rapid assembly of the component parts.

The cattle guards, assembled as in fig. 1, are removed and placed in piles outside the door in the background for shipment as required. Large numbers of these guards are in constant demand as already mentioned, so that nearly all the time there is some one or other of the operations outlined being performed in the shop.

Piece Work System at the Grand Trunk Railway Port Huron Shops.

Under the supervision of J. L. Hodgson, Master Car Builder, G.T.R. shops, Port Huron, Mich., a system of handling piece work has been developed that has proved a very valuable asset. In these shops, everybody but the office staff works on piece work, prices having been set for even the smallest operations, such for example as the painting of a couple of inches of stripping along the side of a passenger car, and similar small tasks. The management in this way knows exactly what the repair of a car will cost down to the last cent, and can therefore determine almost instantly whether it would be advisable to undertake the repairs at that particular time, or wait until they are more extensive, and require a more complete stripping of the car. Knowing the cost and the probable earnings of the workmen, the length of time required to put the repairs through is also known to within a very short space of time. The work can thus be scheduled through with a certainty of its being completed as promised.

A most important item is the fact that the workmen are more satisfied. Whereas

a certain amount of money in it for them, and in consequence, it is to their advantage to complete the task in the shortest possible time compatible with good workmanship. The popularity of the scheme is evidenced by the fact that some little difficulty has been experienced in obtaining foremen in certain of the departments, from the fact that the more dextrous workmen can make as much or more than the foreman in charge of the work. The incentive naturally is to remain where there is the most money.

In the freight car department, the work is handled by tracks. That is to say, a bunch of cripples is run in on one of the shop tracks, and none of the cars are removed until the whole lot are again in operating condition. To each track, there are a given number of workmen, about two per car, apart from the trucks, which are handled separately. These men operate in pairs, as that has been found to be the means of working the men to the best advantage. The numbers of the cars entered for repairs are each written on a separate piece of paper, these several pieces of paper being then rolled up separately and mixed

Fig. 6.—Bevelling Ends of Separators.

low wages are generally the rule where day work exists, from the general indifference shown by the workmen concerning the amount of time wasted on the task, under a piecework system the more the operator does, the bulkier is the pay envelope at the end of the week. This is probably one of the greatest incentives of a piecework system, if it is properly managed like the one under consideration, where the price is set permanently, and the workman has no fear hanging over his head that at some time if too great an amount is earned in a given interval, the price will be cut so as to reduce his earnings. Under such a scheme, the incentive to increase the output of the plant is removed, and the scheme is but slightly better than a day work system that is properly supervised. The greatest loss in such a case lies in the limited output from a given factory. The greater the output from a given factory, other things being equal, the less the standing charge per unit of production, and at the same time, the time when it will become necessary to extend the plant to handle increased business, will be pushed further into the future, involving the use of the capital that might otherwise be tied up, to other purposes. At these shops, no trouble has been experienced with the system, as no cutting exists. The men are given a fair price, and when they start in on a job, they know there is

together in a hat. The leader in each pair of men then draws one of these slips, representing the car on which that couple are to work. This method of distributing the work was made necessary by the fact that while the prices set for each of the different parts of the work have been set as fairly as is possible, some are found to be slightly better than others, and the more wily workmen would soon determine the best jobs, and on each occasion select that one, while probably the more plodding workman would have the poorer one shoved off on him.

As each track of cars is ready to be placed, an incoming inspector goes over each of the cars separately, noting all the repairs required on a special form provided for the purpose. For freight car bodies, this form is 13 x 14½ ins., divided into four main columns of items. At the top of the form, the schedule number, incoming inspector's name, road, class, number, and date commenced, and finally the date completed, are entered by this incoming inspector. In the four main columns of items, there are printed 178 parts, covering every kind of repair possible on the car. Opposite each item, there are three items giving number of pieces, rate and amount. In these columns, at the points required by the nature of the repairs that the inspector observes, the several amounts are filled in, duplicate forms being made out. The original goes

to the office, where it is retained by a chief piecework timekeeper under the supervision of the chief clerk, while the duplicate is handed to the leading workman, so that he may know what repairs are expected of him. At the end of the last item column, there is a space for the entry of the number of workmen on the car, check number, hours and amount. With this repair sheet before them, the workmen know exactly how much money there is in that car for them, and proceed accordingly.

Each pair of workmen operate independently of the others on the balance of the cars in the early part of the work. From the nature of things, some cars will require more extensive repairs than others, and will not be completed as soon as the ones requiring the light repairs. Therefore, the pairs from the light repair jobs, as they complete their tasks, are combined with others on the heavier repair tasks until that job is also finished. In that way, all the workmen are kept employed up to the completion of the final car, by a careful juggling around on the part of the foreman. The total cost of the car is pooled, and the different workmen paid in proportion to the number of hours each one has worked. Needless to say, there are no loafers under such a system, as the balance of the workmen see to it that each one does his proper share and works at the proper rate.

whole car run out into the yard. The final inspection was formerly made in the shop, before the body was lowered on the trucks, but as the car strains are different when in service conditions, it was found that bolts, etc., that had been indifferently tightened up in the shop, were loose in the yard. The workman now makes a point of having everything tight, so as to avoid having to make an extra, unpaid-for trip to the yard to finish a careless job.

Crooked work on the part of the men in turning in false statements of the work, is almost impossible, and requires the co-operation of at least five to make it possible—incoming inspector, two workmen, piece work inspector and the outgoing inspector—an almost impossible combination. The job as finally correct, is signed by the outgoing inspector, and the sheet returned to the office, where it can be compared with the original, and any changes detected.

The work in the passenger car department is handled somewhat differently from that in the freight car department from the very nature of the work. The work here cannot be pooled in the same way, as there are several classes of skilled labor at work at the same time on the car, whereas in the freight car, most of the labor is of a rough type.

The assistant foreman allocates the work to the various workmen, giving out slips

remarkable, and all are of the opinion that conditions are much improved to what they were formerly under the old day work system.

The amount of clerical work involved would at first sight appear to be rather heavy, especially when it is mentioned that for the passenger car painting alone, there are over 3,000 different prices, covering even the smallest detail of repair. The clerks become so thoroughly familiarized with the prices of the different operations that only one is required in each department, and he makes up all the entries and the memos to be given the men each day.

Matching Head Tool Setting Gauge at the Grand Trunk Railway London Shops.

In the saw setting department of the G.T.R. shops at London, Ont., there is a handy little gauge for the setting of the cutters of a planer or lumber matching machine. As shown in the accompanying illustration, it is set up for aligning the cutting tools required in the tonguing and grooving of the edges of matched lumber.

The device consists of a base casting, carrying an upright with a bearing through which projects on each side an arbor of the diameter of the matching machine

Fig. 7.—Assembling Parts of Cattle Guard.

The order for the work from the incoming inspector can at the best only cover such repairs as are apparent before the car is stripped. On stripping, other defects frequently become apparent, and to have them added to the pay list, the workman makes out a separate list of these on a plain piece of paper, and has this signed by either the incoming inspector or the foreman, who must then make an inspection to see if these defects really exist. Unless such an extra slip is made out and signed by the proper authority, the workmen are not paid for this work. This course is taken so that there can be no danger of bunco work.

The workmen each night put in slips of the amount of work performed that day. The piecework inspector, with these slips, checks over the work to ascertain if that amount really has been completed, and on verification, proceeds to make out pay memos to the men, stating the amount earned the previous day. These are delivered to the men before 10 a.m. next day, so that each day, the men are kept advised of the previous day's work. This has been found to be a good incentive to keep them keen on improving past records.

The work as it progresses is checked by the outgoing inspector for quality, and to determine if all the repairs have been performed. The outgoing inspector makes the final inspection after the body of the car has been lowered on the trucks, and the

called "shins," on which the nature of the work is noted. The workman proceeds to perform the work outlined, and on the completion, has the assistant foreman inspect the job and initial the shin, which is then deposited in the piece work timekeeper's box, the assistant foreman then giving the workman another shin for further work. The assistant foreman is in reality an inspector, and distributor of work.

The shins, as they are collected by the piece work time clerk, have the information contained entered on a schedule sheet, one of which is made out for each car, stating the nature of the operation and the price, dimensions, etc., in the same manner as the original sheet used in the freight car department. Before this entry, the clerk measures up the work to ascertain if the amount noted has actually been completed. The entries from the various shins finally completing the car repairs, the schedule is signed by the foreman and passed on to the office. In this case, there is a similar chain through which the orders pass, as in the freight department, requiring a general conspiracy on the part of the various parties responsible in order to have any manipulation of the accounts. The individual amounts are so small as to make the incentive for crooked work of no account.

Briefly, the above outlines the system of piece work as applied to these car shops. The smooth operation throughout is most

Gauge for Setting Cutters in Matching Machine Head.

spindle which carries the cutter head. On a projecting ledge to the front, there is a movable cross arm, the ends of which are located opposite the location of the cutter on the arbor. These ends are open to receive the gauging pieces used for setting the cutting tools.

A gauging piece made of wood is cut as closely as possible to the shape desired, the tongued part in one end and the grooved part in the other as in the piece in the right opening. The cutters for the matched lumber are three in number, at three equidistant points on the circumference, making nine cutters in all. These individual cutters are ground to shape previously to being brought to the setting machine. The gauging piece for the tongued side of the lumber is set in the right-hand opening, the correct distance in towards the centre to give the right diameter to the cutter. The sets of three blades for the tip of the matching and the two sides are then set to this wooden gauge, which has been clamped in position in the opening. The three sets are each in turn set to the same gauge by revolving around the arbor to each successive position. Each combined cutter will then cut to the same diameter. The reverse end of the gauge is entered in the other opening, and the other cutters set in a similar manner. The corresponding cutters are then both ready for application to the machine.

Railway Mechanical Methods and Devices.

Driving Wheel Brass Stand at the Grand Trunk Railway Stratford Shops.

In the G.T.R. shops at Stratford, Ont., there is in use a very convenient stand on which to place the driving wheel brasses while scraping them to a fit on the driving axle. The brass as it comes from the boring mill requires to be fitted to the axle in some cases, and may require lifting off the axle several times between these work-

Scraping Stand for Driving Wheel Brasses.

ings before a final good fit is attained. Lifting the brass off the axle each time, and placing in a convenient position for fitting, consumes time, and it is in the decreasing of the time consumed, and the ease of operation, that this stand excels.

In the vertical guiding sides of the brass as it rests on the axle, two lifting hooks are placed. These consist of a block of steel with a projecting trunnion bearing on one face, while on each of two opposite sides, there are pointed studs, which can be screwed out against the sides of the guiding ways of the brass, the trunnion bearing outward, forming a solid trunnion bearing on each side of the brass, all as shown in the accompanying illustration.

The fitting stand consists of a piece of plate bent upward at each end, and supported on a framework of wrought iron bars. The uppermost ends of the upturned edges of the plate, are cut out to the size of the lifting hook trunnions. The corners of the upturned ends of the plate are cut away to facilitate the workman's movements while scraping.

The brass on the axle is lifted by a swinging jib crane overhead, by means of the trunnions, and placed in a similar position on the stand, the legs downward. That is the normal position, from the fact that the greater weight being there holds them down. To hold the brass up the other way in the position shown in the illustration, there is an attachment to the other side of the supporting stand, consisting of a plate hinged half way down the

side, which can be swung up, a bent end fitting into the guiding way on the side to the right as indicated. The brass is thus in a convenient position for scraping, and the stand itself makes a handy table for the mechanic's tools.

Double Axle Roller at the Central Vermont Railway Shops.

The practice of rolling the journals of car axles, on the completion of the machining in the lathe, is almost universally adopted for giving them a fine and smooth finish that will not be hard on the journal brasses nor entangle the waste in the journal box. In some few instances recently, special axle grinders have been employed for the purpose, and the results obtained have been most satisfactory. The tendency in all shops would seem to lead to the use of grinding wherever possible on bearing surfaces, yet at the same time, the older method of rolling seems to be so firmly entrenched as to be here to stay for some considerable time at least.

A marked improvement on the finishing tools of the single roller type is shown in the accompanying illustration. This is a double roller, so constructed as to equalize the springing tendency on one side as it

turned in the lathe, the roller jaws are kept wide open by turning the threaded screw so as to have the threaded blocks close together near the centering stop. When they are required for service, the screw action is reversed, bringing the rollers 'up against the journal sufficiently tight to give the required rolling action to smooth down the rough surface. The two rollers bear equally on both sides, as it is self adjusting on the pin support from the lathe tool carriage. The rollers are also so mounted as to have the pressure on both sides come diametrically opposite to each other.

The big advantage in such an arrangement lies in the fact that the heavy rolling pressure is equalized on both sides. With the single-roller type, the resulting thrust on the journal is all in one direction across the bed of the lathe, the reaction on the centres, if the rolling is required to reduce a very rough surface, is quite high, with a consequent injurious effect on the lathe. With two rollers placed opposite each other, the reaction is removed from the lathe centres. The double rollers also tend to produce a better job than the single, for, with the latter, the axle is sprung an amount varying according to the distance the tool is from the lathe centre. Consequently, the journal portion tends to be

Double Axle Roller Designed to Equalize the Springing Tendency.

exists in tools with a single roller. On a pin projecting from the side of the tool carriage, there is a vertical double arm standard, carrying at the outer end of each arm a fulcrumed arm. At the upper ends of the fulcrumed arms, there are hardened steel rollers, as in the usual construction. The lower ends of the fulcrumed arms are bifurcated to receive pins projecting from threaded nuts mounted on a right and left hand threaded screw, supported near the centre by a centering stop on the face of the vertical part of the standard. One end of this screw is squared for a socket wrench.

Normally, while the axle bearing is being

tapered smaller at the end. The double rollers have no tendency to spring from the equalized action, so that if the original turning is parallel, the resulting rolled journal will be equally true.

This tool is used in the Central Vermont Ry. car shops at St. Albans, Vt.

McDonald and Son, Toronto, who own a miniature railway at Scarboro beach park, Toronto, have requested the city council's permission to lay a miniature single track railway on Toronto island, from Hanlan's point to Centre island, for the carrying of passengers and light freight. The estimated cost is \$25,000.

Spring Testing Machine at Grand Trunk Railway Port Huron Shops.

The accompanying illustration shows a spring testing machine as installed in the G.T.R. shops at Port Huron, Mich. Other machines of a similar construction are in use at other shops on the G.T.R., essentially the same as this one.

The whole device is carried on a heavy oak post, bedded in the ground in concrete, and is located in the blacksmith shop. Attached to the front of the post there is a lever projecting to the left front, pinned in the front of the post. A short distance out on this lever there is a short link connecting to a plunger guided in a casting on the front face of the post as indicated. At the base of the post are located a pair of air cylinders, the plungers of which operate upward on the under side of a table, which is free to rise, guided in ways on the face of the post. The lever at the top of the post projects several feet to the left, the outer end being supported by a loop from the roof beams. On the extreme outer end, a weight rod is suspended, for

the machine also made more sensitive, from the fact that the distance between points of support have become more positive from the use of knife edges.

Railway Bridge With Solid Plate Floor.

A standard broad gauge 100 ft. span deck girder bridge on the Bengal-Nagpur Railway, India, has two rivetted trusses $10\frac{1}{2}$ ft. deep over all and 10 ft. apart on centres. They are connected just below the top chords by shallow floorbeams $10\frac{1}{2}$ ft. apart carrying two lines of web-connected stringers $5\frac{1}{2}$ ft. apart under the centres of the rails.

The top flanges of the rails and floorbeams are flush and are covered by a full-width continuous flat floor plate 5-16 in. thick rivetted on the longitudinal edges to the bottom flange angles of the top chords. In the axis of the bridge the floor plate is supported by a full-length line of $6 \times 3 \times \frac{3}{8}$ in. tee bars which at each panel between floorbeams has two 45 deg. bends at each end making kneebraces with vertical legs rivetted to the floorbeam webs. The tee rails

responding screw mounted on the upper end of a stand on the cross slide corresponding to the tool post cross slide on the tool carriage of a lathe. This screw end is vertically adjustable through a screw passing up through the centre of the post, actuated by the handwheel at the bottom. Just above the handwheel there is an indexing device for turning the nut through the third of a circle at each move, and it is also possible with the same attachment to cut four and eight sides by indexing. With the hexagon, it is the practice to cut two sides with the index handle to the left, then in the centre, and finally on the right. The next nut has these steps reversed.

In the cutting, the cross slide carrying the nut is carried across through the cutters by the operator manipulating the handle in front, there being no cross feed. For the protection of the operator from the rapidly flying brass chips, the machine is provided in front with a gauge glass front, through which the operation can be observed without any danger to the eyes. This is shown swung out of the way in the off position.

Spring Machine for Accurately Testing Capacities.

the carrying of weights in a manner similar to that on the usual weigh scales.

The spring to be tested is placed on the top of the rising table, and after placing introduced as in a well made scale. Friction certain weights on the weight rod, the air is introduced into the cylinder, compressing the spring to a certain degree, and after the latter takes its final position, the weight lever rises. For each spring there are two capacities that it is required to know. The first is the light load opening of the spring, and the second, the full load opening of the spring. Between the springs on the table, it will be noticed that there is a wooden block, a gauge for the light load spring opening. The weights to correspond to the light weight are placed on the weight rod, and if the gauge block is still free between the springs when the cylinder lifts the weights, the spring has the required light load capacity. A similar course is followed with the full load capacity, a thinner block, the one on the table to the left of the spring in the illustration, is placed in the spring, and the corresponding weights loaded on the arm and the spring tested in this position.

The machine as at first made did not prove at all sensitive, as all the connections were pins. These produced a good deal of friction, which, when multiplied through the series of levers, became quite serious. In the arrangement as it stands now, this trouble has been eliminated, for at each of the pin connections knife edges have been tion is reduced to a negligible quantity, and

Machine for Milling the Hexagons on Brass Nuts.

in the track are spiked to wooden cross-ties resting on a 6×8 in. wooden longitudinal sleeper laid directly on the flat plates under the centre of each rail. The solid floor plate serves as a top lateral system, the bottom chords are X braced by horizontal angles between the sway bracing frames at floorbeam panel points.

Milling Brass Nut Hexagons at Grand Trunk Railway Stratford Shops.

In the brass department of the G.T.R. Stratford, Ont., shops, there is a machine in use of a homemade design, originally designed at the Point St. Charles shops, Montreal, for milling the hexagon flats on brass nuts, performing the job two sides at a time in a very rapid manner.

As the accompanying illustration shows, the machine resembles a double ended lathe, the spindles being carried on heads that are moveable along the ways of the machine by means of the handles and adjusting screws on each end as indicated. In the chucks on the end of the spindles, are flat ended milling cutters, secured in the chuck with set screws. The flat ended milling cutters are made in the same manner as flat drills from bar stock, with the end flattened down, but not with the taper point. These cutters can be brought within any distance of each other to give the desired thickness across the flats of the nut.

The nut is screwed on the end of a cor-

Superheater Switchers.—When the Lake Shore and Michigan Southern Ry. equipped a switching locomotive with a superheater in 1911, the experiment was expected by outside critics to prove a failure. Successful operation since that time has proved from test and observations on the part of the crews, that the saving in fuel and water amounts to 40%, which is greater than on road service. This reduces the time necessary to coal and water. The cylinder condensation is eliminated, removing the possibility, as in ordinary switchers, of water being thrown out of the stack, with injurious results to the clothing of bystanders. In addition, there is an almost entire absence of black smoke. Fires that formerly had to be cleaned every 12 hours, now need cleaning only half as often. Flue leakage has been materially reduced, and it is to be inferred that there will be a proportionately increased life to the boiler with decreased repairs.

Comparative Distances, Moncton to Quebec.—The distance on the National Transcontinental Ry. from Moncton, N.B., to the north end of the Quebec bridge is 460.45 miles, and the distance from Moncton to St. Jean Chrysostome, Que., south of Levis, where the N.T.R. crosses the Intercolonial Ry., is 454.75 miles. The distance from Moncton to this crossing over the Intercolonial Ry. is 487.6, or 32.85 more than by the N.T.R.

The Canadian Northern Prairie Lands Co., during July, sold 320 acres at an average of \$15.25 an acre.

The Design and Construction of Locomotive Boilers.

Following is a continuation of the report of the American Railway Master Mechanics Association's standing committee's report on this subject, presented at the annual meeting in Atlantic City, N.J., recently, the first portion of the report having been published in Canadian Railway and Marine World for August:

ARCH TUBES.—Of the replies received, 15 members use 3 in. tubes, one member uses 2 in. tubes and one member uses $2\frac{1}{4}$ in. tubes. Five members do not use arch

a roller expander and a sectional expander to be used in the ordinary manner to set out the tube, as shown at A, fig. 18. Tubes are then beaded over with a bootleg tool, except by one member who bells out the tube on the water side to prevent the tube from pulling out of the sheet. This member does not use any ferrules. The other two members do use copper ferrules. Fig. 18 at B shows arch tube setting as used by one member.

For the information of the members you will find complete set of instructions for setting arch tubes, which is being used by several large roads with success. This covers tubes expanded and beaded on the outside as follows:

PREPARING HOLES IN FIREBOX SHEETS.—Original holes in firebox sheet must be 3 3/32 in. in diameter. Worn holes must be reamed when more than 1-16 in. out of round. Sharp edges must be removed by slightly rounding with file or reamer.

in. thick seamless drawn steel. The tubes should be cut to proper length and bent to template conforming with drawings. The length can only be determined by actual measurement of the firebox and allowance

Fig. 16.—Arch Tube Hole Plate.

tubes at all. One member supports brick arches with studs fastened into the side sheet.

Thickness of tubes used: .15 in., .165 in., .18 in., .203 in., .25 in. Eight members use thickness of .18 in. Eleven members use seamless steel, one member uses charcoal iron, thickness of tube not given.

PLUGS OR PLATES FOR COVERING Arch Tube Holes in Throat Sheet and Back Head.—Twelve members use brass plugs, one member uses extra large size brass plugs for covering the holes; these plugs are drilled for $2\frac{1}{4}$ in. plug so as to avoid remov-

Fig. 17.—Arch Tube Hole Plate.

ing the large brass plugs when washing the tubes. Three members use plates with ball joints, as shown on figs. 16 and 17, claiming greater ease in removing and applying in close quarters.

THE SETTING OF ARCH TUBES varies. The replies received were indefinite as to just what practice they are following out. Six members did not state whether they use copper ferrules or not. Six members advise that they use copper ferrules. Three members set the arch tubes without ferrules. Three members set the tubes with

Fig. 19.—Different Tools for Beading Tube Ends.

APPLYING COPPER FERRULES.—Copper ferrules must be used at both ends of arch tubes. Ferrules should be 3 ins. outside diameter, .095 in. thick and $\frac{1}{4}$ in. long, expanded by carefully hammering on a round mandrel to snugly fit the hole. Ferrules should be set with 1-16 in. projection

FLARING TUBE ENDS.—After tubes have been set they must be flared at both ends with the flaring tools shown at B, fig. 19. After the tube ends have been thoroughly flared the tube ends are then ready for beading.

BEADING TUBE ENDS.—Additional flar-

Fig. 20.—Twelve Styles of Throat Sheet Belly Brace.

on each side of sheet and secured in place with a roller expander.

PREPARING AND APPLYING TUBES.—Tubes must be 3 in. outside diameter, .18

ing with tool shown at C, fig. 19, is necessary to start the bead. The bead must then be formed with special beading tool, fig. 19. Notice that it is not desired to

form a full bead. The bottom of bead should stand 1-16 in. clear of the sheet.

MAINTENANCE OF ARCH TUBES.—Tubes should be thoroughly examined and cleaned at each washout of the boiler. At the least indication of scale formation in the tubes the pneumatic tube cleaner must be used. The tube cleaner is secured to a length of $\frac{1}{2}$ in. air hose, to which is attached another $\frac{1}{2}$ in. hose for supplying water while cleaning. Care must be taken so as not to break the cleaning cutters by

Fig. 21.—Two Methods of Throat Sheet Belly Braces.

allowing cleaner to be pushed through opposite end of tube. Stop must be provided on hose set at proper length for this purpose. Tube cleaner must be lubricated with signal oil fed through a lubricator in air supply pipe, 30 drops a minute. After cleaning, tubes must be inspected by holding a light at opposite end of tube to make sure that tubes are thoroughly cleaned and free from scale.

framing of the car. The Pullman standard design and Pennsylvania standard of upper deck is built up on the floor as a unit and consist of pressed deck sill, upper deck carlins, posts, roof sheets, deck plates of pressed or rolled stock, the whole being applied to the posts after the lower framing is up. Side sheets, roof sheets, letter board plates, etc., are made of spliced sheets, or in one piece where convenient, the older constructions showing splices at posts with invisible joints and countersunk rivets, which have been found rather expensive in construction and weak as far as countersunk rivets in thin plates are concerned.

The permissible combined stresses for this framing, considering weight, load, and end shocks, the latter varying from 300,000 to 500,000 lbs., are usually taken within the range of 15,000 to 18,000 lbs. per square inch, but the weight of the car depends to a great extent on the selection of carrying members of the car, some designers preferring to build an underframe of which the carrying members are contained in the underframe only, as side sills and centre sills, thus keeping the centre of gravity of the carrying section within a small distance from the point where combined buffing shocks resulting from drawbar and buffing device are received.

Other designers take the construction of side plates, side sheets, belt rails and deck plates as carrying members of the cars into consideration and brace the sheets where necessary to prevent buckling. This construction has the advantage of permitting the use of a comparatively light underframe, but the centre of gravity of the whole section is thereby raised and larger bending moments resulting from buffing shocks are encountered, caused by the larger distance of centre of gravity from the centre of buffing shocks.

Roof sheets have, to my knowledge, not been considered for carrying members of this type of car, most probably on account of the comparative thinness of sheets and the minimum resistance to shear attained in the small sized rivets used for roof sheet connections, further on account of the complicated form of roof in general, although no buckling of sheets could be feared, since they are curved to fit the outline of the roof and stiff enough in most cases to resist compression stresses at the centre of the car.

The end framing of the cars is in most cases built up of heavy rolled sections, which are invariably stronger than the present day reinforced end framing of wooden cars, in order to prevent telescoping, some of the designers even using heavy platform posts back of the diaphragm as well, thus securing a double barrier against telescoping. There is no definite data as yet which would give a safe practical resistance to prevent telescoping, with the exception of the assumption of sections by the U. S. Postoffice Department, these being of a section modulus of 65 at a height of 18 ins. above the floor level.

Omitting the advantages of steel cars over wooden cars entirely there are many points which point in favor to the double deck car. The main consideration of most of the railways that has led to the adoption of the double deck steel passenger cars was their general outline, which follows the old type wooden car, so that the general appearance of a train when made up of wooden and steel cars will not be spoiled. The travelling public, used to this deck construction, looks with favor upon the inadequate but visible ventilating device maintained through the decksash opening, and overlooks the more efficient but less noticeable ventilators applied to cars.

In sleeping cars the insufficient light

entering the car through the deck sash is the only light besides artificial light that supplies the wants of an upper berth traveller for his early morning gymnastics called "dressing."

Not very much will be said in this place of disadvantages of the double deck type of steel passenger cars, since a comparison with the single deck type of car is inevitable.

THE SINGLE DECK TYPE.

The single deck car underframe is built up in a similar way to the underframe of double deck cars, but it is a very rare case, indeed, that calls for a fishbelly type of centre sills, a medium sized rolled shape being found to answer the purposes of construction in every way.

The superstructure up to the side plate above the posts, is the same as used with the double deck cars. A carlin connects the two side plates in a single sweep, and is in most cases made of pressed steel. The roof sheets are applied direct to the carlin, but it is quite a common practice to use tar paper at the spliced joints in order to get a water-tight connection between roof sheets. The application of tar paper for joints ought to be abandoned where roof sheets are carrying members of the car,

A RAILWAY MANAGER'S TRIBUTE TO THE VALUE OF ADVERTISING.

Advertising solicitors are frequently told by manufacturers and others that railway men do not read advertisements but merely look at the reading matter pages. We have abundant evidence to the contrary, and give the following letter as an example of it:

International Railway of New Brunswick,
Campbellton, N.B., August 24, 1912.
The Publishers,
Canadian Railway and Marine World,
Toronto, Ont.

Gentlemen,

I have been a constant reader of Canadian Railway and Marine World for a number of years and wish to say that I appreciate it very much on account of the valuable information it contains, and the fact that its reading matter is so invariably correct.

Its advertising pages are also of great interest and value, and I find the Purchasing Agents' Guide, which you publish in each issue, particularly useful, and frequently refer to it for the names of manufacturers, etc., of various railway supplies.

Yours truly,
E. H. Anderson, Manager.

since it is impossible to get and maintain an absolutely stiff joint in such places with this practice. The roof sheets are usually made heavier than in the double deck car type since a certain amount of deterioration is taken into consideration, so that after a series of years of oxidization the sheets are still strong enough to stand the strains they are subjected to. The carrying members of the car are as follows: The centre sills, side sills, side sheets, belt rails (if used in this construction) side plates and roof sheets.

The centre of gravity of the carrying section of the car is naturally higher than in a double deck type, and the buffing shock lever is naturally larger, but it is in almost every case possible to have a carrying cross section weighing less per lineal foot than in a double deck type of car, since the tension and compression members are spaced a larger distance apart.

I do not know of a case where a steel platform casting has been used in this construction, since it has always been the aim of the designers to reduce the weight of this type of car as much as possible.

Fibre stresses and buffing shocks are kept within the same limits as mentioned for double deck cars.

The advantages of this type of car over the double deck type of car are numerous. First of all the single roof construction, with slightly increased thickness of sheets and a deeper curvature of roof, permits the use of the roof sheets for carrying purposes, which also permits cutting down of the side plate since a heavy side plate would not increase the section modulus of the car materially. There is no need of a special bracing of the roof sheets, because the large curvature of the roof effectively prevents buckling of sheets. I would advocate in this type of car the omission of side plate and carlins entirely and have the posts pressed in such a manner that they would substitute the carlins, this means an extension of posts same as used on lower deck of Pullman standard sleeping car, opposite posts being joined at the apex of roof by means of a splice plate and covered with the roof sheets in the conventional way. It will be harder to press these posts, but incidentally the omission of side plates and carlins means a reduction in weight and labor, both of which facts mean a cheaper car, and, furthermore, an easy regulation of width of car over posts, which is found difficult to maintain in pressed carlins, as they are very liable to warp after pressing and while cooling, thus changing the width of car unless the carlins are repressed cold in a close fitting die, which process is expensive and therefore to be avoided.

The air volume contained in single deck cars, compared to the air volume of double deck cars of the same length, is larger, at the same time the outside cooling surface of the single deck car compared to that of the double deck car is smaller, the body construction (labor and material) is cheaper than the double deck type; this can also be said of the total cost of inside finish. There are not as many bends and joints to be made when applying insulating material, which is a very important item for the successful insulation of cars. The head room of the car is generally higher in the turtle back type.

As these cars cannot be ventilated by the use of a deck sash more efficient ventilators are applied, which are either working in conjunction with the lighting fixtures or applied separately, as is the practice of the Harriman lines.

The reduction of light caused by the elimination of the upper deck sash is a matter that might be taken as a drawback, but if one takes the amount of subdued light filtering through the old type art glass deck sash into consideration coupled with the amount of soot and dirt received through the same source, this advantage is turned to a decided disadvantage. In case the turtle back car should be used for a sleeping car design, the lack of light from the deck sash could be easily remedied by the application of skylights, consisting of a cast oblong concave glass let into the roof in the centre of the car, placed so that the convex side of the glass will project above the level of the roof, which will give the collecting soot and dust a chance to be blown off the smooth surface of the glass by the action of wind and rain.

A turtle back car would, on the other hand, provide decidedly more space for headroom in the lower as well as upper berth, since the roof starts up at the posts with an abrupt rise, giving about 8 to 10 ins. more total headroom at the centreline of berth than a double deck car, which would mean an increase in headroom of from 4 to 5 ins. per berth.

Despite the increased headroom and air volume per passenger, the turtle back car is easier to be heated, since there is no draft through deck sash, permitting heated air to escape when the ventilators

are closed and further the slightly decreased total roof surface should be a great factor in keeping the car warm on a smaller steam or fuel allowance than permitted for double deck cars.

CONSTRUCTIONAL DETAILS.

Constructional details are matters that should take the whole attention of the car department of the railway and that of the contractor. The simpler details are worked out the easier it will be to replace them when in service, and although I am a firm believer in pressed pieces for car construction, I will concede that it is easier to replace standard angles or shapes than to replace the former.

The use of windows of different height and size in one type of car, as well as the use of half elliptic deck sash of art glass above the window, are features that I think objectionable from the purchaser's standpoint, since it is necessary to shape the outside steel sheets as well as the inside finish in many cases to the shape of this half elliptic sash, which is an expensive job when executed in a repair shop without the aid of dies or presses. The different sizes of windows mean a larger number and more frequent change of dies in the contract shop, which operation takes time and money, on account of the greater number of templets and dies used and the work connected with these changes, the bill of which must be footed by the purchaser, without gaining any visible advantage excepting perhaps the rather doubtful pleasure of keeping a larger number of window panes or sash in stock to suit the different sizes of windows, since the saving in glass caused by different construction is a negligible quantity.

It is, however, erroneous to suppose that it is necessary to employ large hydraulic machinery, big squaring shears or multiple punches to do the repair work, as I have seen shops that built cars commercially successful without any of the heavier type of machinery used in freight car construction.

In regard to the means of permanent connection of several units in steel passenger car construction, we have at present only two methods that are to be mentioned here and these are rivetting and spot welding. The former, most commonly used, is a source of a great deal of trouble and expense in the erection of the cars, since it means a lot of preparatory work before a rivet can be driven. All material must be centre-punched, marked, punched to different rivet sizes, which causes in many cases rehandling of material on different machines, or resetting of single machines, assembling, reaming, and rivetting. Rivet holes never meet as perfectly as the drawings show them to meet, and the only means of getting the holes right is to punch them smaller and ream them to size afterwards when assembled. This is very expensive as to labor, and there is no assurance that the rivet will fill the hole after being driven. I have seen rivets driven in holes that were about $\frac{3}{8}$ in. too large, so that the hole was covered up by the rim of the rivet instead of being filled by the rivet shaft, but I must not forget to state that this was on freight car work.

Spot welding, though at present only out of the experimental stage, promises to eliminate all this trouble. Sheets and pressings are trimmed to size, placed in jigs, representing side or end of car and welded up with a specially designed spot welding machine. These welds will stand about 30% more in shear compared to a rivet of the same size in a punched hole, and the whole structure will be stiffer than a rivetted structure of the same design, since there is no surplus space in a rivet hole

that would permit the sheet to shift when under stress. These facts have been partly proven by personal experiments while connected with the American Car and Foundry Co., and further by those conducted by Chief Electrical Engineer, Mr. Osborn, of the same company. The testing of spot welded joints is as easy as the inspection of rivetted joints, but it would be advisable to have the inspectors watch the welding process, as well as inspect the weld after cooling. The former inspection will prevent a poor weld being made, by watching the flash between sheets, which is invariably a sign of perfect weld, the second inspection being confined only to rapping the weld with a hammer and judging the weld by the difference in tone to that of the unwelded portion of the sheets. Both inspection methods should supplement one another and should be especially applied to heavy welding work in carrying members of cars, since the use of spot welding in connection with steel inside finish would hardly call for more than a general inspection. There is no doubt at all that this is the future of the steel freight car, and I am certain that electrical spot welding will be successfully adopted for all steel passenger cars as well. The commercial success of this method is guaranteed, since this process will mean a considerable reduction in the price of cars, amounting to from 3 to $3\frac{1}{2}\%$ of the price total of the car figured on a rivetted basis.

MAINTENANCE.

The maintenance of steel passenger cars is one of the most serious questions with railway companies, excepting, of course, those roads that are in a position to build their own cars and which, therefore, can take care of the repairs of their equipment with the machinery they use for the construction of new cars. Another item which was not heeded well enough in the first cars built, and which is now going to bother those members of the railway fraternity that have to keep the cars in working condition, is the question of rust protection in places not visible, between outside shell and inside finish of cars.

We know that a body kept at a certain low temperature, and afterwards transferred to a place of higher temperature with a high percentage of humidity, will sweat or condense moisture on its surface, until the body has risen in temperature to that of the surrounding air, at which point the condensed moisture will be slowly absorbed by the air. The amount of moisture taken up is largely dependent on several factors, like the ductility and temperature of the condensing surface, thickness of sheets, moisture, temperature and volume of surrounding air, etc.

In steel passenger cars the inside face of the outside steel shell is that part of the car most subject to this occurrence, and what conditions are prevalent at this particular place? The steel sheets were sand-blasted, and after that given either a coat of red lead mixed with an indifferent grade of linseed oil of the quick drying "gasoline" variety, or the car was coated on the inside with two or three coats of poor varnish. On top of this was applied by means of wooden strips or o.h.s. straps a layer of $\frac{3}{4}$ to $\frac{1}{2}$ in. hair felt insulation quilted in paper, the whole being enclosed by anything but an airtight inside finish.

In the winter the temperature in the car is kept about constant, the humidity is rising, caused by exhalation of the passengers, reduced ventilation only takes place, and the result of this is that a highly humid air current is set up in the space between outside and inside shell of car, caused by leaks in the inside finish. The outside shell is constantly cooled through the movement of the car, condensation takes

place on the inside surface of the outside shell, the force and extent of which is dependent on the care and material with which the sheets have been coated. The condensation freezes between the hairfelt insulation and the outside shell. Warm weather sets in, the ice thaws, and the water settles at once in the hair felt, from which place it is hard to dislodge. Meanwhile freezing and thawing have some influence on the sheet insulation material, the coat of paint, naturally poor, has given way in the form of cracks, flaking off sets in and the moist hair felt will start rusting in a very short time.

A better system of rust protection has been introduced of late, consisting of the application of an elastic coat of varnish applied to the sand blasted inside surface of the outer shell, which is covered before setting with a blast of finely broken cork dust. This process can be repeated several times until the treated surface becomes almost non condensing, by reducing ductility through the cork layer, after this the hair felt is applied by means of nails previously welded to the inside surface of the outside shell, by means of their heads, the points projecting inwards. The hair felt or other insulation material is impaled on these nails and the latter bent over after the insulation sheets had been pushed to the outside sheets. This prevents the movement of hair felt on the surface of inside shell and consequently keeps the cork surface in good condition. I think it would be worth while to improve further on this system by means of a waterproof coating on top of the quilting and a careful pasting down of insulation joints in order to prevent every possibility of water condensing on the sheets.

In an experimental way the use of calcium chloride, applied in fixed receptacles between outside and inside shell, would be worth while trying, since the latter is a powerful moisture absorbing agent without doing any harm to steel or other metals. In all cases the inside finish ought to be applied as tight as possible and all fissures closed. The application of sheathing to the outside of steel cars, in imitation of wooden cars, consisting of a series of sheets, pressed or drawn to the well known keystone shape and fastened to the carrying sheets by means of screws or rivets placed in the depressions of the sheets, which in turn are covered by keystone shaped steel troughs, fitting into the dovetails of the first applied sheathing and placed in position by sliding them into place from the side sill edges of the car, after the troughs have been coated with a specially prepared varnish, has not proven very successful. The composition material smeared into the keystone openings of the later used wooden blocks, visible on the bottom edge of the cars, have dropped out in places in the course of time, moisture got in and you can imagine the result in some of the cases, after a lengthy exposure.

A handy tool for the repair of damaged steel cars and for any class of passenger car work as well, is one of the gas welding outfits with cutting attachments now so popular in the car shops of this continent. The system used is more or less dependent on the work to be done and the facilities on hand.

Oxygen hydrogen welding will be welcomed at those places where direct electrical current is obtainable at low prices and the use of a supplementary acetylene tank for the mixture of hydrogen with acetylene for welding purposes will permit the raising of welding temperatures from $3,900^{\circ}$ for the oxygen hydrogen system to $4,900^{\circ}$ which temperature is more than enough for any kind of work in the steel

passenger car repair shop. Oxygen acetylene, oxygen oil gas, oxygen blaugas, and oxygen coal oil vapor-gas welding outfits and the scope of their work are at present so well known that it is hardly worth while to go into details.

When looking forward to electrically welded (spot welded) steel passenger cars, the question of repairs is seen in an entirely new aspect. As long as the use of patches, as for instance in freight car service, would be permissible, the item of repairs would be easily enough answered, but I am sure that no railway company of the present day would permit the use of visible patched cars, or would even tolerate the use of rivets for the replacement of the new sheets. Joints of spot welded sheets are hard to separate, since there are no rivet heads to be cut off, which would permit the separation of a combination into its units. The cutting torch would have to be employed to cut the damaged sheets or rivets out, after which the remaining strips of material of the damaged sheets, welded to the uninjured sheets, would have to be separated by means of heating with the welding torch, rolling up of the impaired material, and cutting welds with torch or chisel.

In the construction of spot welded cars considerable care would have to be taken in designing the car, so that in case of repairs the repaired parts would be accessible with the spot welding machine, since rivet joints would be excluded from use, as they would not fit in with the design of the uninjured part of the car.

All these questions are, however, solvable, and they will be eventually simplified by the use of specially designed tools for this purpose, so that these apparent drawbacks will more than outweigh the cheaper construction and the greater rigidity of the joints.

(To be Continued.)

Canadian Northern Railway Earnings, Etc.

Gross earnings, working expenses, net earnings, increases, or decreases, compared with those for 1911-12, from July 1, 1912:—

	Gross Earnings	Expenses	Net Earnings	Increase
July	\$1,829,700	\$1,335,100	\$494,600	\$133,000
	\$1,829,799	\$1,335,100	\$494,600	\$133,000
Incr.	\$ 353,800	\$ 220,800	\$133,000	

The mileage in operation during July was 4,297, against 3,711 in July, 1911.

Approximate earnings for Aug., \$1,745,800, against \$1,420,600 for Aug., 1911.

Canadian Pacific Railway Earnings, Etc.

Gross earnings, working expenses, net earnings, increases or decreases, compared with those for 1911-12, from July 1, 1912:—

	Gross Earnings	Expenses	Net Earnings	Increase
July	\$12,052,398.58	\$7,604,221.68	\$4,448,176.90	\$745,148.57
	\$12,052,398.58	\$7,604,221.68	\$4,448,176.90	745,148.57
Incr.	\$ 2,390,580.44	\$1,645,431.87	\$ 745,148.57	

Approximate earnings for Aug., \$11,886,000, against \$10,073,000 for Aug., 1911.

During August, the mileage operated was increased to 11,178.

Grand Trunk Railway Earnings, Etc.

Aggregate from July 1 to Aug. 31:—

	1912.	1911.	Increase.
G.T.R.	\$7,650,473	\$6,890,203	\$760,270
C.A.R.	402,272	366,945	35,327
G.T.W.R.	1,168,503	1,124,775	43,728
D.G.H. & M.R.	393,618	364,120	29,498

Totals \$9,614,866 \$8,746,043 \$868,823
Approximate earnings for Aug., \$4,966,415, against \$4,502,674 for Aug., 1911.

Western Canada Railway Club.—At the monthly meeting, Sept. 9, J. E. Forslund, General Colonization Agent, C.P.R., read a paper on the relation of the company's land and immigration department to the traffic department.

Mainly About Transportation People.

SIR WM. C. VAN HORNE has been elected Chairman of the Metropolitan Parks Commission, Montreal.

SIR WILLIAM MACKENZIE returned to Toronto, Sept. 3, after a business trip to the Pacific coast.

E. J. CHAMBERLIN, President G.T.R. and G.T.P. Ry., has been elected a director of the Montreal Warehousing Co.

D'ARCY SCOTT, Assistant Chief Commissioner Board of Railway Commissioners, left Ottawa, Sept. 6, for a European trip.

J. R. LECKIE, G.T.R. locomotive foreman at Stratford, Ont., was married to Miss M. Hamilton at Palmerston, Ont., Sept. 5.

H. L. DRAYTON, K. C., took up the duties of Chief Commissioner of the Board of Railway Commissioners at Ottawa, Sept. 4.

CECIL B. SMITH, M. Can. Soc. C. E., who died in Toronto recently, left an estate valued at \$126,870.90, to his widow and two sons.

J. S. W. DOUGALL, President Dougall Varnish Co., Ltd., Montreal, has been elected a Director of the Canada Accident Assurance Co.

P298 A. Copony,
Chief Draughtsman, Car Department, Grand Trunk Railway.

G. D. PERRY, General Manager Great North Western Telegraph Co., Toronto, and Mrs. Perry, have been spending a short time at Brackley Beach, P.E.I.

C. W. RHODES, who acted as paymaster G.T.R. during construction of the Western division from 1880 onwards, died at Victoria, B.C., Sept. 4, aged 51.

MISS C. PARENT, daughter of S. R. Parent, formerly Chairman National Transcontinental Ry., was married to A. C. Major, of Ottawa, at Dorion, Que., Sept. 11.

T. CLARKE, for 30 years foreman of the G.T.R. yards at Point St. Charles, Montreal, and from which he retired in 1905, died in the Royal Victoria Hospital, Montreal, Aug. 29.

L. J. STREET, heretofore Vice President, Canadian Inspection Co., Toronto, Toronto, has been appointed as salesman on the Dominion Iron and Steel Co.'s staff at Sydney, N.S.

MRS. W. H. GRANT, wife of the Manager of Construction, Mackenzie, Mann and Co., Ltd., returned to Toronto early in September, after spending the summer in Europe.

SIR WM. C. VAN HORNE is reported to be interested in the formation of the Canadian Steel Package Co., a charter for which is being asked from the Dominion Government.

THOS. O'KEEFE, who is referred to in a press report as Assistant Roadmaster, Michigan Central Rd., Welland, Ont., died there, Sept. 23, from an affection of the bronchial tubes.

ANSON CAMPBELL, insurance broker, Montreal, who died in the Royal Victoria Hospital there, Sept. 2, aged 78, was for a number of years Assistant Treasurer of the old South Eastern Ry.

O. A. TRUDEAU, advertising clerk in the G.T.R. District Passenger Agent's office, Montreal, was married Sept. 16 to Miss S. Paquette. The office staff presented him with an easy chair.

MRS. D. B. HANNA, wife of the Third Vice-President, Canadian Northern Ry., returned to Toronto early in September, with her family, after spending several weeks at Lake St. Joseph, Que.

W. D. MATTHEWS, Director C.P.R., has been elected Vice-President Canadian General Electric Co., to fill the vacancy caused by the death of H. P. Dwight, President Great North West Telegraph Co.

JAS. DUNSMUIR, director C.P.R., with Mrs. and Miss Dunsmuir, arrived in Montreal, Sept. 15, from England, where they had been for the past year. They subsequently left for their home in Victoria, B.C.

DUNCAN MacPHERSON, Assistant to the Chairman, National Transcontinental Railway Commission, has resigned the chairmanship of the Canadian Society of Civil Engineers' committee on railway ties.

MISS M. G. NANTON, daughter of A. M. Nanton, formerly Managing Director, Alberta Ry. and Irrigation Co., was married in Winnipeg, Sept. 5, to Lorne Cameron, son of the Lieutenant-Governor of Manitoba.

The Countess Jacques de Lesseps, daughter of SIR WILLIAM MACKENZIE, with her son, returned to Europe in September, accompanied by her sister, Mrs. W. Beardmore, after having spent the summer in Canada.

The Rt. Hon. Sir Richard J. Cartwright, G.C.M.G., who died at Ottawa, Sept. 24, following an operation for strangulated hernia, was father of A. D. CARTWRIGHT, Secretary of the Board of Railway Commissioners.

D. C. McNAB has been appointed Deputy Minister of Railways, Telegraphs and Telephones for the Saskatchewan government, vice S. P. Porter, who was recently appointed Executive Agent, G.T. Pacific Ry., Regina, Sask.

SIR THOS. SKINNER, London Eng., director C.P.R., arrived in Quebec, Sept. 13, and proceeded to Winnipeg and other western points, in connection with the business of the Hudson's Bay Co., of which he is Deputy Governor.

J. J. HILL, ex Chairman of the Board, Great Northern Ry., was entertained at dinner in St. Paul, Minn., on Sept. 16, his 74th birthday, by citizens of that place and other friends throughout the northwest, about 1,200 being present.

J. W. SIFTON, who died at Winnipeg, Sept. 19, built the telegraph line from

Winnipeg to Fort Pelly in the seventies and was also a contractor on the C.P.R. when portions of it were being built by the Dominion Government.

The Canadian Ticket Agents' Association has enrolled the following new members recently:—C. R. Coleman, C.P.R., Truro, N. S.; C. E. Hardy, C.N.R., Sudbury, Ont.; W. A. Cameron, G.T.R., Durham, Ont.; W. R. Widdess, G.T.R., Lindsay, Ont.

G. E. WADLAND, who succeeded the late H. W. Mills, as Manager of the Sarnia Street Ry. recently, has also been appointed G.T.R. town ticket Agent at Sarnia, Ont., to succeed Mr. Mills, and has joined the Canadian Ticket Agents' Association.

V. A. HARSHAW, Superintendent C.P.R., Woodstock, N.B., while starting out on an inspection trip on his railway motor car, Aug. 28, collided with a team at a crossing, and was thrown out, but escaped with a bad bruising and some minor injuries.

M. FLYNN, for many years Master Mechanic Michigan Central Rd., was accidentally suffocated by coal gas in his house at St. Thomas, Ont., recently. One of his sons, W. H. Flynn, is Superintendent of Motive Power M.C.R. at Detroit, Mich.

A. D. McRAE, of Davidson and McRae, and associated with the Mackenzie, Mann and Co.'s industrial enterprises in British Columbia, will, it is said, be gazetted honorary Lieut.-Colonel of the 6th Regt., Duke of Connaught's Own Rifles, Vancouver, B.C.

J. A. THOMPSON, Dominion Inspector of Steamboats, died in the Jubilee Hospital, Victoria, B.C., Sept. 2, aged 65. He arrived in British Columbia in 1886, and after three years' service on coasting steamers was appointed Inspector of Steamboats there.

C. Le B. MILES, M. Can. Soc. C. E., who for some time past has been Division Engineer on Algoma Central and Hudson Bay Ry., construction builder at Michipicoten Harbor, Ont., has returned to Calgary, Alta., where he is going into private practice and contracting.

G. I. EVANS, who has been appointed Superintendent of Angus Locomotive Shops, C.P.R., Montreal, was born there, May, 1880, and entered C.P.R. service, April, 1900, since when he has been, to Mar., 1906, draughtsman; Mar., 1906, to July, 1910, Chief Draughtsman; July, 1910, to Aug., 1912, Mechanical Engineer.

F. G. MILLEN, who has been appointed Assistant Treasurer, C.P.R., Montreal, was born there, Feb. 21, 1875, and entered C.P.R. service, June 1, 1890, since when he has been, to Oct. 1, 1890, in Accounting Department; Oct. 1, 1890, transferred to Secretary's office, where he has served in various capacities, being, at the date of his present appointment, Aug. 30, chief clerk.

A. P. GILLIES, who attracted considerable notice in Toronto as the promoter of a plan for the building of a great central terminal station hotel and office building during the past two or three years, has been sent to jail at Tacoma, Wash., in default of finding bail for \$10,000, pending an investigation of alleged fraud in connection with an industrial concern he was promoting there.

S. P. PORTER, who has been appointed Executive Agent, G.T. Pacific Ry., Regina, Sask., and whose portrait appears in this issue, was born in 1870, in Somersetshire, Eng., and came to Canada in 1886. He entered railway service in 1889, with the C.P.R., as trainman. From 1901 to 1907, he was homestead inspector for the Dominion government, and in 1908 he was appointed Deputy Minister of Railways, Telegraphs and Telephones for Saskatchewan,

which position he resigned some few months ago.

SIR THOS. G. SHAUGHNESSY, President C.P.R., left Montreal, Sept. 4, on his annual trip of inspection over the company's lines west of that city. He was accompanied by Sir Edmund Osler, R. B. Angus, and W. S. Matthews, directors; F. F. Begg, London, Eng.; and Jas. Redmond, Montreal. George Bury, Vice President and General Manager, Western Lines, accompanied Sir Thomas from Fort William to the Pacific Coast and back. At different points of the trip the party was met by the general superintendents and other officers, who travelled over their respective divisions. Sir Thomas returned to Montreal Sept. 23.

M. J. POWER, whose appointment as General Purchasing Agent, C.P.R., Montreal, was announced in our last issue, was born at Montreal, June 19, 1877, and entered C.P.R. service, Mar. 16, 1891, since when he has been, to Nov., 1893, office boy, etc., General Passenger Department, Montreal; Nov., 1893, to May, 1897, stenographer, same department; May, 1897, to June, 1898, secretary to General Passenger Agent, Montreal; June, 1898, to Aug., 1901, secretary to

P299 S. P. Porter,
Executive Agent, Grand Trunk Pacific Railway.

Passenger Traffic Manager, Montreal; Aug., 1901, to July, 1908, secretary to the President; July, 1908, to July 29, 1912, chief clerk and private secretary to the President.

The Montreal daily press recently announced the death of ALLAN CAMERON, in London, Eng., on Sept. 12, and stated that he held the position of General Traffic Agent, C.P.R., New York, since Jan., 1909. The dispatch from London, Eng., stated that the death had occurred there of Allan Cameron, second son of the late Hon. John Hillyard Cameron, of Toronto, aged 61. Allan Cameron, of the C.P.R. service, was born at Toronto, March 14, 1864, and was, for a time General Traffic Agent, C.P.R., New York, but in February last was appointed Superintendent Land Branch, Department of Natural Resources, C.P.R., Calgary, Alta. He still occupies that position.

B. F. SHORTLEY, who has been appointed Terminal Agent, Intercolonial Ry., Bonaventure station, Montreal, was born at Montreal, June 24, 1866, and entered

railway service, Sept. 27, 1887, since when he has been, to May 1, 1900, in G.T.R. service, as switchman at St. Hyacinthe, Que., telegraph operator at various points, including three years at St. Lambert, Jct., Que., and from 1893, as train dispatcher at Montreal, Belleville, Ont., and Island Pond, Vt.; May 1, 1900, to the date of his present appointment, in I.R.C. service at Bonaventure station, Montreal, as clerk, operator, assistant to Terminal Agent, and acting Terminal Agent.

The Minneapolis, St. Paul and Sault Ste. Marie Ry. report for the year ended June 30, contains a memorial notice, recording the directors' appreciation of the late W. D. WASHBURN, a former director of the company, who died recently. In part, it reads:—"In the fullness of years and achievement, the first President of this company, and one of its directors from its organization, he passed away in Minneapolis, Minn. In his death, not only has this company lost an able and loyal conservator of its interests, but the board has also parted from a personal friend, whose presence and counsel will be deeply missed after the association of so many years. He saw the incalculable benefit to his home city and the northwest, of a highway of commerce to the seaboard by way of Sault Ste. Marie, and surmounted all apparent obstacles, and with other associates, whose interest he enlisted in the enterprise, began the construction of such a highway, and to-day the Soo line exists as a monument to his enterprise and genius."

A. COPONY, an article by whom, on suggestions and deductions from steel passenger cars, appears on another page, and whose portrait also appears in this issue, is a British subject, born in Vienna, Austria, in 1880, where he was educated in the public and high schools, and the Engineering College, whence he graduated in 1901. After serving in various capacities with some English machinery manufacturers, at their branches in Vienna and Fiume, Hungary, he went to the U. S. in May, 1907, and from that date to Feb., 1910, was engaged with the Standard Steel Car Co., Butler, Pa., as draughtsman, and assistant chief draughtsman, and at the company's Hammond works, where he was Master Mechanic, Passenger Car Department. From Feb. to Oct., 1910, he was in charge of toll designing for the American Car and Foundry Co.'s new passenger car shops at St. Charles, Mo., and later on was engaged on experimental work in the company's St. Louis shops. He resigned in Oct., 1910, on his appointment as Chief Draughtsman, Car Department, G.T.R. Western Division, and was shortly after transferred to Montreal as Chief Draughtsman, Car Department, same company.

The Canadian Ticket Agents' Association's 26th annual meeting will be held in Ottawa, Oct. 9 and 10. The headquarters will be at the Chateau Laurier, where the business meeting will be held. The social features will include a visit to the Parliament buildings, a car ride around the city, a trip on the Ottawa river, theatre and other social parties. On Oct. 11 the party will leave for Montreal, and will partake of afternoon tea on the Donaldson line s.s. *Saturnia*. That evening they will board the White Star-Dominion line s.s. *Laurentic* and leave at daybreak on Oct 12 for Quebec, where they will disperse.

W. BELL, at one time President, Guelph Junction Ry. Co., and one of the founders of the Bell Piano and Organ Co., Guelph, Ont., was found dead on the G.T.R. track near that city, Sept. 26, his body having been badly mutilated by a train.

Railway Development.

Projected Lines, Surveys, Construction, Betterments, Etc.

Alberta Interurban Ry.—There has been deposited with the Secretary of State at Ottawa a mortgage deed dated April 12, between the company and the Trust and Guarantee Co., covering the company's whole undertaking, present and future.

The Board of Railway Commissioners has approved of location plans for this line from the north line of sec. 31, tp. 24, range 28 west 4th meridian to sec. 15, tp. 29, range 23 west 4th meridian, mileage 9.93 to 66.80, and has authorized it to build along highways.

Algoma Central and Hudson Bay Ry.—The Board of Railway Commissioners has authorized the opening of the line for traffic from Hawk Lake jet. to a junction with the C.P.R. transcontinental line near Hobon, Ont., 31.5 miles. Hawk Lake jet. is at mileage 164.5 on the main line from Sault Ste. Marie, and is the point where connection is made with the company's branch line to the Helen and other mines and to Michipicoten harbor.

In connection with the extension of the line from near Pangissin to Park Lake jet., T. J. Drummond, President Lake Superior Corporation, is reported as stating, Sept. 5, that it was expected to be able to put on a regular train service through from Sault Ste. Marie in November. About 25 miles of the track had to be ballasted. North of the C.P.R., 12 miles of track had been laid and it was expected that by the end of the year track would be laid for a further distance of 48 miles to the crossing of the Canadian Northern Ontario Ry. It was expected to have the line completed to a junction with the G.T. Pacific Ry. by the end of 1913. (Sept., pg. 450.)

Burrard Inlet Tunnel and Bridge Co.—The North Vancouver city council has voted an additional \$50,000 in aid of the building of the projected bridge across the second narrows of Vancouver inlet. (Sept., pg. 450.)

Central Ry. of Canada.—We are officially advised that the company has ordered in the U. S., 1,500 tons of 80 lb. steel rails for prompt delivery. This is in addition to an order previously given the Algoma Steel Co. Track laying will be started as soon as grading is completed from McAlpine to the Norton river, Ont. Ties have been delivered for the first 30 miles. All the bridges and culverts are under construction, and a contract has been given the Canadian Bridge Co., Walkerville, Ont., for the steel viaduct over the Scotch river. The station yard at McAlpine has been laid out, and a station, to be used jointly with the C. P. R., is about to be built. Construction will be pushed ahead west of South Ingham as rapidly as possible. Construction is also under way east of McAlpine, through Hawkesbury, St. Andrews, and St. Eustache, thence on to the Back river and into Montreal. F. Stuart Williamson is Chief Engineer. (Sept., pg. 450.)

Delaware and Hudson Co.—We are officially advised that there is no truth in the press report which stated that the company was securing a large area of land on the south shore, opposite Montreal, east of the Chambly road, upon which to lay out a yard and to build a roundhouse and repair shops. (July, pg. 339.)

Dominion Atlantic Ry.—Plans for the erection of additional wing walls for a bridge at Bridgetown, N.S., and for a bridge over the Avon river at Windsor, N.S., have been approved by the Board of Railway Commissioners.

The Board of Railway Commissioners has approved of revised location plans for the line across Gaspereaux river, just east of Horton Landing, N.S., and of plans for the substructure of the proposed new bridge across the Gaspereaux river.

A contract has been entered into, under the act granting subsidies to certain railways, between the company and the Department of Railways, for the building of a line, not to exceed 15 miles, from Centreville westerly to Weston, N.S. (Sept., pg. 450.)

Edmonton, Dunvegan and British Columbia Ry.—The Board of Railway Commissioners has approved of location plans from mileage 0 to 5.13, out of Edmonton, Alta.

The Minister of Railways has approved of route maps for revised location of the line north of Edmonton for 45 miles.

It is reported that grading has been practically completed from near Edmonton to Athabasca Landing, and that track laying will be started at once. A. C. Galbraith, Provincial Superintendent of Works, is reported as stating that it is expected to have the track laid to Athabasca Landing this year.

There has been filed with the Secretary of State at Ottawa a trust deed dated July 22, made between the company, the National Trust Co., and the province of Alberta, covering the company's property as security for the 30 year 4% bonds which are guaranteed by the province. (Sept., pg. 450.)

Fort George to Barkerville.—Application is being made to the British Columbia Legislature to incorporate a company to build a railway from the Nechaco river near Fort George, southeasterly to the Fraser river, along the valley of that river to Six Mile creek, then easterly and southeasterly to Willow river, then northeasterly to Bear river, and then southeasterly to Barkerville, B.C. Burns and Walkem, Vancouver, are solicitors for applicants.

Interprovincial and James Bay Ry.—The Minister of Railways has approved of route map for this projected railway for 54 miles northerly from the terminus of the C.P.R. Kipawa branch at Kipawa, Que. (May, pg. 239.)

Erie, London and Tillsonburg Ry.—We are officially advised that J. H. Teall, the original promoter of this railway, has sold the company's charter and assets to the G.T.R.; and that construction was formally started on the line a short distance north of Port Burwell, Ont., July 30. (Sept., pg. 450.)

Esquimalt and Nanaimo Ry.—R. Marpole, Vice President, and H. E. Beasley, General Superintendent, recently concluded an inspection of the extensions under construction. The grading on the extension from McBride jet. to Lake Qualicum is practically completed, with the exception of a section near Deep bay; about 75% of the Platt river section is completed; and progress has been made on the Trent river-Union bay section. The location of the branch line from Courtney to Duncan bay was also inspected. (Sept., pg. 450.)

Fredericton and Grand Lake Coal and Ry. Co.—Track laying is reported to have been started at Gibson, N.B., on the line to Minto, and it is expected that track laying will be started at the Minto end in a short time. Connection will be made with the C.P.R. by crossing the bridge at Fredericton. At Minto the line will con-

nect up with the line of the New Brunswick Coal and Ry. Co., which took over the old Central Ry. of New Brunswick and which will be taken over from the New Brunswick Government. This line gives connection with the Intercolonial Ry. at Chipman. Press reports state that it is proposed to build a spur line eight miles from Minto to the National Transcontinental Ry.

The development of the coal areas is being carried on by the Minto Coal Corporation, organized by Sir Thos. Tait, with a capital of \$400,000. A large number of coal properties have been taken over, and it is expected that the development work will have been so far advanced, that coal production can be begun in December. There are at present four producing collieries, having an output of 6,000 tons a month, giving traffic to the existing railway. It is estimated that the Minto coal field contains about 150,000,000 tons. (Sept., pg. 450.)

Ha Ha Bay Ry.—The Department of Railways has entered into a contract with the company, under the terms of the act granting aid to certain railways, for the building of the following lines: From a junction with the Quebec and Lake St. John Ry. in Jonquiers tp., to St. Mathias, Que., not exceeding 20 miles; from La Crosse jet. to the Saguenay river, northerly through Chicoutimi, Que., not exceeding five miles; from La Terriere jet., southerly via La Terriere village to Lake Kenogami, not exceeding 10 miles; from the existing line near Bagotville, Que., easterly to St. Alexis, Que., not exceeding 3 miles. (May, pg. 238.)

Intercolonial Ry.—Tenders are under consideration for the erection of an addition to the freight car repair shops at Moncton, N.B.

We are officially advised that the engineering staff is making a survey of the Cape Breton section of the line between Point Tupper and Sydney, N.S., with a view of bettering the gradients and alignment.

In an interview Sept. 12, W. F. Tye, formerly Chief Engineer, C.P.R., is reported as stating that he considered the Dominion Government should lose no time in extending the Intercolonial Ry. to Georgian Bay. A new double track, low gradient line from Montreal to Georgian Bay, is urgently needed. The traffic, he says, is already waiting for it, and the line is needed to relieve the congestion of the present railways. (Sept., pg. 450.)

Kettle Valley Lines.—Press reports state that Grant Smith and Co., Spokane, Wash., have been given a contract for building 57 miles of line from the lower end of the lake near Summerland, through Naramata to Hydraulic summit, near Kelowna, B.C. The reports also state that track has been laid to within 12 miles of Hope summit, from near which point it is said that a joint line will be built to Hope in conjunction with the Vancouver, Victoria and Eastern Ry. and Navigation Co. (Sept., pg. 450. See also under Great Northern Ry. Lines in Canada.)

Kootenay and Alberta Ry.—The Board of Railway Commissioners has authorized the opening of this line for freight traffic. The speed is not to exceed four miles an hour over trestles, and 10 miles an hour on the rest of the line, light power to be used, watchmen to be kept on each trestle, and the towers and foundations under truss spans to be inspected at least once a week.

This line is 13 miles, which has been built by the Western Coal and Coke Co., from Pinetree harbor, on the C.P.R.'s Crowsnest Pass line to the company's

coal mine at Beaver creek, Alta., was considerably delayed in construction, owing to a variety of causes, principally wet weather and sliding ground. The track laying was, however, completed to the mine on June 25, and a train was run over it. The line is of standard construction, with light gradients and easy curvature. Three miles of sidings have been built to the colliery and storage yards. There are some large timber structures, particularly over Langs coulee, at mileage 7, which is 195.5 ft. high, and at Mill creek, mileage 10, which is 159.5 ft. high. One big cut required the excavation of 149,000 cubic feet. The directors anticipate that as the line traverses an excellent agricultural district, its revenue from the carriage of farm produce will be an important addition to those derived from the transportation of coal. L. B. Merriam is Chief Engineer. (Sept., pg. 450.)

London and Port Stanley Ry.—In connection with the proposal to lease this line to the Lake Erie Coal Co., the directors ask that some new freight shed and station accommodation be provided at Port Stanley, Ont. The L.E.C. Co. proposes to expend \$400,000 on electrifying the line in return for a 25 years lease. The directors have bought 22 acres of land for an extension of the freight yards at Port Stanley. It is expected that the lease will be signed at an early date. (Feb., pg. 68.)

Medicine Hat, Alta.—The plans of the building of the spur line from the Ansley colliery into Medicine Hat, Alta., have been completed, and application is being made to the Board of Railway Commissioners for their approval. The right of way is being acquired, and arrangements made for starting construction. Mr. Ansley states that he expects to have the line built this year. (July, pg. 339.)

Michigan Central Rd.—The Board of Railway Commissioners has approved of plans for the erection of a bridge across London street, Windsor, Ont. (Aug., pg. 412.)

Minneapolis, St. Paul and Sault Ste. Marie Ry.—Press reports state that a contract has been let for the building of a spur line of three miles to the mines on Cuyuna range, Minn. F. Baxter, Superior, Wis., is the contractor. (Sept., pg. 451.)

Northern New Brunswick and Seaboard Ry.—A contract has been entered into between the company and the Department of Railways, under the act granting subsidies in aid of certain railways, for the building of 26 miles of railway from the Drummond mines at Austin Brook to the Intercolonial Ry., and thence to Alston Point, N.B. The line from Austin Brook to the Intercolonial Ry. has been built and is being operated. (Aug. pg. 412.)

Northern Pacific Ry.—President Elliott is reported as stating, Sept. 5, that the line from Seattle, Wash., to Sumas, on the International boundary, 120 miles, will be rebuilt next year, with reduced gradients and easier curves, and that it will be relaid with heavier steel.

Pacific Great Eastern Ry.—A commission has been appointed to settle the question of the route of the line in West Vancouver, B.C. The company has located its line along the waterfront for 2.5 miles, and the municipality desires that it be set back for from 100 to 250 ft. Application has been made to the Provincial Minister of Railways for the approval of the route of the line from Howe sound to Pemberton Meadow, 10 miles, but objection is made by the Howe Sound and Northern Ry., which has a line between the same points. Consideration of the matter was adjourned.

The P.G.E. Ry. has power to acquire the H.S. & N. Ry., but so far they have been unable to come to terms.

Vice President D'Arcy Tate, is reported as stating, Sept. 5, that the funds necessary for construction had been provided, and that work would be gone on with as soon as the plans were approved. An additional survey party, under F. G. Ashe, has been put in the field to work from Lillooet southwesterly. (Sept., pg. 451.)

Pacific and Hudson Bay Ry.—The route of this projected railway for the section of the line from Bella Coola, to Natakus lake, B.C., 230 miles, has been approved by the Minister of Railways. The line starts at Bella Coola, at the head of Burk channel, and follows the valleys of the Bella Coola and Athnarko rivers to Two Mile lake, thence crossing to the valley of the Salmon river, which is followed for some distance, thence to the valley of the Entico river to Natakus lake. C. E. Cartwright, Vancouver, is Chief Engineer. (Aug., pg. 412.)

Quebec and Saguenay Ry.—A contract under the act granting subsidies to certain railways has been entered into between the company and the Department of Railways for the building of 62.8 miles of line from St. Joachim, Que., northeasterly.

Practically all the work on the construction of the line is reported to have been suspended owing to financial troubles. Sir Rodolphe Forget, President, is quoted as stating, Sept. 2, that trouble had been going on between the shareholders for some time, before it was decided to suspend operations. It was reported from Quebec Sept. 3, that 44 actions had been entered by employees on construction, and on Sept. 7, an action was entered against the company by O'Brien and Doheny, the general contractors, to recover \$381,988.42 for work done and money paid.

The annual meeting was held in Quebec, Sept. 17. The following are the directors and officers for the current year:—President, O. B. Daoust; Vice President, H. G. Matthews; other directors:—Sir Rodolphe Forget, L. G. Morin, L. E. Morin.

St. John and Quebec Ry.—The New Brunswick Government, Sept. 10, finally approved of the plans for the building of the Gagetown-Swan creek section of the line. The Government has now approved of the plans for the whole line within the province. (Sept., pg. 451.)

Timiskaming and Northern Ontario Ry.—Track laying on the Elk Lake branch of 29 miles is reported to have reached the Jean Baptiste river, 12 miles west of Earlton, Ont., and ballasting is in progress. A large timber bridge is being built across the river, and it is expected that track laying will be resumed on the 10 miles between the Jean Baptiste river and the Montreal river, by Sept. 30. This river will be crossed at the Mountain chutes, by a steel bridge, for which a contract has been let. Grading has been practically completed into Elk Lake, and it is expected that the branch will be completed by Dec. 1. (Sept., pg. 451.)

Toronto, Hamilton and Buffalo Ry.—General Superintendent Eber is reported as stating, Sept. 10, in connection with the application being made to the Board of Railway Commissioners for an order compelling the depression of tracks in the city, "We have been trying to correct the existing conditions for some time, but it is a matter demanding careful attention and the gathering of many details from different sources. We have had engineers working for some time on the idea of depressing the tracks, but I cannot say just now what they are ready to report. They have reached no definite conclusion. It is a

vital question, both to the city and ourselves, and our aim is to satisfy everybody. In my opinion the outcome depends on the city's attitude." (June, pg. 302.)

Wellington Colliery Ry.—A meeting of shareholders was held in Victoria, B.C., Aug. 30, at which resolutions were considered authorizing the directors to issue debentures, subject to the approval of the Minister of Railways, and to authorize the directors to purchase such other railways as might be desirable for the carrying on of the company's colliery business. (Aug., 1908, pg. 551.)

Toronto Union Station.

The question of the Toronto union station was down on the list of matters to come before the Board of Railway Commissioners in Toronto, Sept. 26, in connection with the city council's application for the final approval of plans, and for the fixing of a definite date when work is to be started.

Speaking of the new union station, Sept. 5, Sir Thomas G. Shaughnessy, President C.P.R., is reported to have said: "Work can be started on the building immediately. All that the C.P.R. asks is that the station be known as the union station. Our road will not run into any station that bears the name of another company. The company has already commenced work on the grade separation which must be completed before the new building can be erected."

In the course of an interview, Sept. 9, E. J. Chamberlin, President G.T.R., is reported to have said he could not state when actual construction would begin. It would take three months for the architect to prepare the plans necessary before it would be possible to call for tenders. The chief engineers of the two lines were engaged on the preparation of detailed plans. The C.P.R. would occupy the new station jointly with the G.T.R.

Railway Route Maps Approved.

The Minister of Railways has approved the following route maps:—

Canadian Northern Branch Lines Co.—Aug. 30. From tp. 18, r.l., w.p.m., to tp. 26, r.l., w.p.m., 38 miles.

Canadian Northern Ontario Ry.—Sept. 10. Through Montreal Island, about 17 miles.

Canadian Pacific Ry.—Sept. 16. From Hawarden to Floral, Alta., 46.8 miles.

Edmonton, Dunvegan and British Columbia Ry.—July 26. Revision north of Edmonton, Alta., about 45 miles.

Erie, London and Tillsonburg Ry.—July 24. From Aylmer to Port Burwell, Ont., about 12 miles.

Interprovincial and James Bay Ry.—Aug. 30. From Kipawa branch, northwesterly, 54 miles.

Canadian Pacific Railway Company

North Toronto Grade Separation

NOTICE TO CONTRACTORS

Sealed proposals will be received by the undersigned, up to 12 o'clock noon on Saturday, October 5, for the construction of the sub-structure of the AVENUE ROAD SUBWAY, at North Toronto.

Plans and specifications can be seen at the office of the Engineer of Grade Separation, at No. 260 Avenue Road.

The lowest or any tender not necessarily accepted.

B. RILEY,

Engineer Grade Separation

Toronto, Sept. 23, 1912.

Canadian Northern Railway Consolidation Locomotives.

The Canadian Locomotive Co. is delivering to the C.N.R. 25 consolidation locomotives for freight service, equipped with the latest type of superheater. These locomotives weigh in working order 188,600 lbs., and are of the usual type of consolidation locomotives, with semi-wide firebox over frames. Three hundred and forty-eight flexible staybolts are used in the breaking zone of firebox. The ashpan is of the C.N.R. style of hopper bottom. Outside steam pipes are used, incased within an air tight jacket secured to cylinder and smoke box. This arrangement eliminates most of the obstruction in the smoke box met with when using the inside steam pipes. The Pyle National electric headlight is used. The boiler is fed from the top, through an arrangement of check valves in base of bell stand. The tender tank holds 6,000 imperial gallons of water and 12 tons of coal. The frame is built of 10 x 13 ins. steel channels. The truck is of the equalized type, with a cast steel bolster. The equipment includes Westinghouse brakes ET no. 6 type, with two 9½ in. air pumps. The following are the principal dimensions, etc.:—

Traction effort	35,000 lbs.
Weight in working order	188,600 lbs.
Weight on drivers	163,000 lbs.
Weight of engine and tender, total ..	332,600 lbs.
Wheel base, rigid	15 ft. 6 ins.

Grand Trunk Railway, Betterments, Construction, Etc.

Southern New England Ry.—Press reports state that surveys are being made under the direction of G. M. Thompson, for a line from Hoylake, Mass., eastward to the Central Vermont Ry.; and through New Hampshire, towards Boston, Mass.

St. Lambert Yards, Etc.—In connection with the work now in progress at St. Lambert, Que., press reports state that the company has bought 400 acres of land, and a long strip extending almost to St. Hubert, and that in addition to laying out yards there, locomotive and other shops will be built. These will not replace the Point St. Charles shops, but will, it is said, be utilized for G.T. Pacific Ry. purposes. One report says that the new shops will be completed within five years.

Victoria Jubilee Bridge Approaches, Etc.—Plans are under consideration by the Montreal city council for the enlargement of the yards at Point St. Charles, for which purpose it is necessary to rearrange the approaches to the Victoria Jubilee bridge. The City Engineer was directed to examine the plans and report fully.

We are advised that a contract has been let to the John S. Metcalf Co., Montreal, for a freight warehouse at the corner of Wellington and Bridge streets, Point St. Charles, Montreal. It will be 1,200 by 60

Port Burwell to London, Ont.—Construction is in progress at Port Burwell, Ont., on a line to Aylmer, and engineers are reported to be in the field locating a route from Aylmer to London. Press reports state that construction will be pushed so as to have the line completed to London within a year. (Sept., pg. 448.)

Grand Trunk Pacific Railway Annual Meeting.

A. W. Smithers, of London, Eng., Chairman of the Board, presided at the annual meeting in Montreal, Sept. 18. Good progress was reported on the construction of the main line, as well as on branch lines, the latter comprising approximately 2,000 miles, which the company has at present under construction in Manitoba, Saskatchewan and Alberta, which make connection at many different points with the main line. Track-laying on the main line to the Pacific Coast has reached mile 1,100 west of Winnipeg and beyond the Rocky Mountains. Track laying from the Pacific Coast at Prince Rupert easterly has reached mile 176 at Hazelton, B.C. This leaves a section to be constructed of about 460 miles, which, however, is all under contract, and the work is being carried to completion as rapidly as the character of the country and the labor supply will permit.

Canadian Northern Railway Consolidation Locomotive.

Wheel base, engine, total	23 ft. 9 ins.
Cylinders, diam. and stroke	23 by 26 ins.
Piston valves	12 ins.
Driving wheels, diam.	57 ins.
Boiler pressure	180 lbs.
Boiler, diam. at first ring	66½ ins.
Firebox, length and width ..	114 by 40½ ins.
Tubes, no. and diam.	179—2 ins.
Flues, no. and diam.	24—5½ ins.
Tubes, length	14 ft.
Heating surface, tubes and flues ..	1,772 sq. ft.
Heating surface, firebox	179 sq. ft.
Heating surface, total	1,951 sq. ft.
Superheater heating surface, inside tubes ..	360 sq. ft.
Grate area	31.8 sq. ft.
Weight on drivers—tractive effort	4.7
Total weight—tractive effort	5.38
Tractive effort x diam. of drivers—heating surface	800.88
Total heating surface—grate area	78.33
Firebox heating surface—total heating surface per cent.	7.18
Weight on drivers—total heating surface ..	61.02
Volume equivalent cylinder, cub. ft.	12.5
Total heating surface—volume of cylinder ..	199.28
Grate area	2.54
Equivalent heating surface, 1,951 sq. ft. (1.5 x 360 sq. ft.)	2491 sq. ft.

Dominion Railway Subsidy Agreements.—

The Dominion Government has entered into subsidy agreements for the following construction,—with the Canadian Northern Pacific Ry., Aug. 7, for a line from the Yellowhead pass to Vancouver and the mouth of the Fraser river, 525 miles; and with the Canadian Pacific Ry., Aug. 2, as lessee of the Calgary and Edmonton Ry., for a bridge over the Saskatchewan river, connecting Strathcona and Edmonton, Alta.

ft., concrete foundations, with brick walls and steel posts, wooden doors and roof.

Prescott, Ont.—The ratepayers of Prescott, passed a bylaw, Sept. 23, conferring an agreement between the town council and the company, for the establishment of divisional terminal facilities. Under the agreement the land owned by the company will be assessed at \$16,000 a year for 25 years, and the town will provide \$35,000 for the settlement of land damages, etc. The company agrees within two years to lay out terminal yards, and erect a roundhouse, repair shop and other buildings at a cost of not less than \$150,000.

Diversion Near Bracebridge, Ont.—The Board of Railway Commissioners has approved of revised location plans for the line in the vicinity of Moore's crossing, near Bracebridge, Ont.

King St. Subway, Toronto.—Plans are under consideration for the reconstruction of the bridge across King street west. It is proposed to remove the present stone pillars in the centre of the roadway, replacing them by steel, and to increase the headway to 14 ft. The city council has the plans under consideration, and it is suggested that the headway might be increased to 18 ft.

Hensall, Ont., Yards.—Plans have been approved by the Board of Railway Commissioners for the rearrangement of the yards, and the building of a new station.

Following is the board as constituted for the current year: President, E. J. Chamberlin; other directors, A. W. Smithers, Sir Henry M. Jackson, Sir Felix Schuster, Sir Wm. Henry White, W. Wainwright, M. M. Reynolds, E. H. Fitzhugh, W. H. Biggar, E. B. Greenshields, Hon. R. Dandurand, W. M. Macpherson, Hon. G. A. Cox, E. R. Wood and J. R. Booth.

Jules Hone is also a director, appointed by the Dominion Government under the agreement with the company respecting the construction of the eastern division. The newly elected directors are Sir Felix Schuster and Sir Wm. Henry White, who are directors of the G.T.R. Co., and serve in their turn on the G.T. Pacific board.

Ore Shipments from Fort William.—The Northern Pyrites Mining Co., which is located near Fort William, Ont., is said to be negotiating for special arrangements with the Grand Trunk Pacific Ry. for the shipment of large quantities of pyrites ore in the near future. The proposed arrangements would necessitate the construction of ore docks and other ore handling facilities at Fort William.

A Montreal press dispatch towards the end of September, stated that the C.P.R. had placed an order with the Montreal Locomotive Works, for 125 locomotives, but up to the time of going to press we were unable to obtain any confirmation of this.

Canadian Pacific Railway, Construction, Betterments, Etc.

Second Track Work at St. John's, Que.—

We are officially advised that the second track work between St. John's and Highlands, Que., 22 miles, is well on to completion. The application made to the Board of Railway Commissioners was for approval of plans for a second track from mileage 17.35 Farnham subdivision, a point between St. Gregoire and Iberville jet., but the plans submitted therewith only covered the work from the eastern end of the yards at St. John's. It is likely that the second track work will be continued easterly from St. John's to Farnham, next year, but plans for this work have not yet been approved. When undertaken the work will be covered by a new application to the Board. J. M. H. Fairbairn, Assistant Chief Engineer, Montreal, has charge of the work.

The Board of Railway Commissioners has authorized the opening for traffic of the portion of the second track from L'Acadie to north of diamond crossing G.T.R. at St. John's, Que., 3.60 miles.

Campbellford, Lake Ontario and Western Ry.—

The following assistant engineers have been appointed in charge of 40 mile districts under the Engineer of Construction, C. W. P. Ramsey, viz.:—C. Lusecombe, Parham station; W. H. McGaan, Belleville; G. R. Balloch, Cobourg; E. Duncan, Newcastle; H. H. Charles, Agincourt.

The Board of Railway Commissioners has approved of location plan for the line from mileage 125.5 to 127.32, west of Glen Tay, and of plan for a subway on road allowance between lots 8 and 9, Scarboro tp., Ont.

The following subcontracts have been let for grading, etc., on the line:—Mileage 41 to 43, Taylor and Thom, Enterprise, Ont.; mileage 46 to 51, P. McCoy, Croydon, Ont.; mileage 51 to 56, Irvine and Morrison, Roblin, Ont.; mile 69, A. McDonald, Shannonville, Ont.; mileage 70 to 82, Mulhern and Barrett, Shannonville, Ont.; mileage 82 to 84, McRae and Campaigne, Bayside, Ont.; mileage 84 to 88, F. R. Welford, Belleville, Ont.; mileage 88 to 91, Deeks and Hinds, Belleville; mileage 91 to 105, F. R. Welford; mileage 107 to 110, E. P. Creswell, Colborne, Ont.; mileage 115 to 123, Chisholm and Morley, Cobourg, Ont. The subcontract for concrete work from mileage 40 to 55, has been let to Campbell and Lathmore, Perth, Ont.; mileage 55 to 80, to the Highland Construction Co., Toronto; for all structures mileage 80 to 106, F. R. Welford, and for the Jones creek culvert, to T. Manley and Son, Belleville, Ont.

We are officially advised that the following are sub-contractors on the first 40 miles out of Glen Tay:—Mileage 0 to 6.2, P. McCoy, Kingston, Ont.; mileage 6.2 to 7.5, J. M. Foreman, Perth, Ont.; mileage 7.5 to 8.5, McMartin and Murdock, Perth; mileage 8.5 to 9.0, Shea and Huff, Perth; mileage 9.0 to 11.5, McMartin and Murdock; mileage 11.5 to 15.0, A. and W. D. Wheaton, Amherst, N.S.; mileage 15.0 to 24.8, Toronto Construction Co., general contractors, Belleville, Ont.; mileage 24.8 to 39, Johnson Bros., Belleville; mileage 39.0 to 40.0, White and Scriven, Smith's Falls, Ont.

Toronto Yards.—The retaining wall along Front street, from Bathurst street easterly to Spadina avenue, Toronto, has been finished, and the clearing away of the sloping bank is well advanced. The switch connections are being made with the various tracks, so as to connect with the track on the acquired ground leading to the new yards on the site of the old Government house.

Toronto West Second Track Work.—Work has been restarted on the second track west-

erly from Toronto, which now terminates west of Islington, Ont. It is said that the line will be at once extended through Cooksville, to Hurontario street—the Port Credit Collingwood road—and that the new track will be connected by a Y with the branch line to the G.T.R. at Mimico yards.

Fordwich, Ont.—The Board of Railway Commissioners has approved of location plan for some improvements at Fordwich, a station on the Teeswater line, and local reports state that surveyors have been at work in the vicinity locating lines to Listowel, and to Blyth, on the Guelph and Goderich Ry.

Chatham to Sarnia, Ont.—Press reports state that surveys have been made for a line from Chatham, via Petrolea, to Sarnia, Ont., and that its construction is under consideration.

In a recent interview the mayor of Sarnia is reported as having stated that he had had a conversation with H. D. Lumsden, M. Can. Soc. C. E., upon railway matters, and he understood that construction would be started almost immediately on a line into Sarnia. Representatives of the Sarnia board of trade have visited Montreal recently in the interests of railway extension, and the mayor added he understood that considerable property had been acquired in the vicinity for railway purposes.

Main Line Location McNab Tp.—The Board of Railway Commissioners has authorized the company to change the location of its main transcontinental line in McNab tp., Ont.

Blind River Bridge.—The Board of Railway Commissioners has authorized the company to rebuild bridge 102.55 over Blind river, Algoma subdivision, Lake Superior division.

Lake Superior Division Second Track.—Some details were given in Canadian Railway and Marine World for July, pg. 349, with reference to the second track work on this division. Considerable progress has been made with this work, which when completed, will have a considerable effect in preventing congestion at divisional points, and generally along the line. The pin truss bridge across the Big Pick river, consisting of two 160-ft. spans and two central 180-ft. spans, is being replaced by a plate girder bridge. The central spans are left the same length, but the end ones are divided into two, of 80-ft. span. The Little Pick river bridge, of two 165-ft. pin trusses with shore approaches, is having the two main spans replaced with plate girders of similar span.

It is said that some consideration has been given to a plan for diverting the line from Anglin, 22 miles west of Heron Bay, to the Little Pick river bridge, and running inland along a valley, to get away from the shelf construction along the lake front. Nothing has yet been done in the way of locating a route for such a diversion.

Fort William Improvements.—It is said that a number of additional spur tracks to serve industrial concerns are to be built at once at Fort William, Ont.

Press reports state that the construction now being carried on upon Island no. 1 form part of a large plan for the development of the company's railway and steamship facilities, which is to be carried out during the next five years at a total estimated cost of \$10,000,000.

Boissevain to Lauder, Man.—The Board of Railway Commissioners has approved of revised location plans for the projected line from Boissevain to Lauder for 35.29 miles. The line will have a total length of 37 miles, and will extend from Boissevain, where the Great Northern Ry. line to Bran-

don crosses the C.P.R. Winnipeg-Deloraine-Lyleton line, to Lauder, where a branch runs west to Alida, Sask.

Estevan to Forward, Sask.—The Board of Railway Commissioners has approved of revised location plans for the line from Estevan to Forward, 55 miles.

Hawarden to Floral, Sask.—The Minister of Railways has approved of the route map for a line from Hawarden, 22 miles south-east of Outlook, on the line northwesterly from Moose Jaw, northerly to Floral, 11 miles east of Saskatoon, Sask., 46.8 miles.

Asquith to Conquest, Sask.—The Board of Railway Commissioners has approved of location plans for a line from Asquith, Sask., 24 miles west of Saskatoon, southerly to Conquest, a few miles west of the crossing of the Saskatchewan river at Outlook on the branch northwesterly from Moose Jaw, 35 miles.

Swift Current Southeasterly.—The Board of Railway Commissioners has authorized the opening for traffic of the extension of the Swift Current southeasterly line, from Neville to Vanguard, Sask., mileage 27.5 to 43.6.

Swift Current Westerly.—The Board of Railway Commissioners has approved location of the Swift Current branch, formerly Swift Current to Brooks branch, mileage 0 to 84.98. Brooks is a station on the main transcontinental line, 66 miles west of Medicine Hat, and it is said that the line formerly projected from Swift Current to Brooks, is now to be carried to Bassano, Alta. The line is open for traffic as far as Cabri, and is under contract for 80 miles further. Press reports state that final surveys for the remaining mileage have been completed.

Suffield Southwesterly.—We are advised that this line is under construction for 55 miles in a southwesterly direction from Suffield, Alta. The original contract let to J. G. Hargrave Co., Ltd., called for the building of 30 miles, but this was extended to cover an additional 25 miles. The line traverses the Southern Alberta Land and Irrigation Co.'s lands for 3 miles, and through homestead land for the remaining two miles, terminating in sec. 9, tp. 13, range 17 west of the 4th principal meridian, at Barvey, a post office 25 miles north of Taber. The line runs through uncultivated land, but at its proposed present terminal reaches a good farming country, right through to Carmangay, in which there is considerable settlement. The general contractor has let subcontracts as follows:—Mileage 0 to 1, Morrison and Cusack, Suffield; mileage 1 to 3, C. Chapman, Suffield; mileage 3 to 9, G. H. Webster, Calgary; mileage 9 to 10, W. B. Adams, Okotoks; mileage 10 to 12, Wallace Bros., Carlstadt; mileage 12 to 13, Olson and Nelson, Suffield; mileage 13 to 14, Swanson and Anderson, Suffield; mileage 14 to 15, W. B. Aeres, Suffield; mileage 15 to 16, A. Anderson, Suffield; mileage 16 to 22, Higdon and Kerr, Medicine Hat; mileage 22 to 36, E. G. Brandenburg, Suffield; mileage 36 to 38, E. Erickson & Co., Suffield; mileage 38 to 40, H. Mainland, Cayley; mileage 40 to 42, Kelly and Ferris, Taber; mileage 42 to 46, G. H. Webster, Calgary; mileage 46 to 52, F. McCleod, Calgary; mileage 52 to 55, several small pieces and the general contractor's own plant. There is approximately 1,500,000 cubic yards of earthwork in the whole. It is expected to have the work completed this year. There is one moderate sized bridge across the South Saskatchewan river.

Stratheona-Edmonton High Level Bridge.—A contract has been entered into between the C.P.R. as lessees of the Calgary and Edmonton Ry., and the Department of

Railways, under the act granting aid for the construction of certain railways and bridges, for the erection of a bridge across the Saskatchewan river, to connect the line now terminating in Strathecona, with the city of Edmonton, Alta. The construction of this bridge has been going on for some time.

Laggan to Lake Louise, B.C.—The Board of Railway Commissioners has authorized the opening for traffic of the branch line from Laggan to Lake Louise.

Galloway to Waldo Branch.—The Board of Railway Commissioners has authorized the opening for traffic of the final section of this branch, from Caithness to Waldo, B.C. This branch starts from Galloway, on the Crowsnest pass line, and runs into the coal fields at Waldo, near Elko, B.C.

Calgary to Vancouver Second Track.—Press reports have been busy for some time with regard to the surveys being made for the building of a second track from Calgary to Vancouver. The latest is that the work will include the driving of a tunnel from Bear creek, east of the Selkirk summit, to a point east of Glacier station, a distance of eight miles, at a cost of \$1,500,000 a mile, and that the tunnel will have a gradient of 1% except for a short distance in the centre where the gradient will be 2%. The same report also states that plans are being prepared for a duplicate of the spiral tunnel at the big hill between Laggan and Field. These are mere rumors, as before anything is decided upon, every possible plan will be investigated.

We are officially advised that a second track is to be built from Ruby creek to Hammond, B.C., 57 miles. The contract for this work is reported to have been let to Grant Smith & Co., Seattle, Wash.

We are officially advised that the first section of the second track work east of Vancouver covers from mileage 106.8 at Hammond pit to mileage 128.7 at the eastern end of Vancouver yards, through which there is already a second track. There are no particular engineering features on this piece of work. Along Burrard inlet, between mileage 110.0 and 128.7, the line originally followed the shore. In making the second track the line has been straightened as much as possible, and the engineers have succeeded in cutting out approximately 225 degrees of curvature in 10 miles. Excavations have been hard pan and cemented gravel, slopes of which have been left practically as rock cuts. A few old slides have been struck, but by draining the land back of the railway it has been possible to stop any movements. With the exception of the bridge across the Pitt river, the bridge work on the section has been of minor importance. Grading is practically complete, steel laying is being proceeded with, and the line is being rock ballasted. It is expected that the work will be completed within three months.

Press reports state that the substructure of the Pitt river bridge is being put in, and that a contract for the superstructure has been let to the Dominion Bridge Co.

H. Vindal, Division Engineer, Vancouver, has charge of the second track construction between Ruby creek and Vancouver.

The Toronto Globe stated recently that the Canadian Northern Ry. had found the operation of the gas electric car on the Quebec & Lake St. John Ry. so satisfactory that it had ordered a number of similar cars. We are officially advised that no further orders have been placed, and it is not likely that any will be before next year, if then. It is possible that one of these cars may be put on the Central Ontario Ry. between Trenton and Picton, Ont., next summer.

Motor Car Being Tested on Schomberg and Aurora Railway.

A Galt, Ont., dispatch to Toronto papers, Sept. 19, stated that a gasoline motor car, built in the United States and imported by the Preston Car and Coach Co., has been operated between Galt, Preston and Berlin on the Galt, Preston and Hespeler Electric Ry., and added that the car had been sold to the Canadian Northern Ry. We are officially advised that the C.N.R. has not bought the car, but that arrangements were made with the Toronto and York Radial Ry. to try it on that company's line between Schomberg and Aurora, which is operated by steam.

The entrances and exits of this car are of the side centre entrance type. The car is double-ended and operated from a cab located in the corner of each end. The propulsion and regulation of the car is extremely unique and simple. The first car of this type manufactured has an engine of the four cylinder, four cycle type, cylinder dimensions $5\frac{1}{2} \times 6\frac{1}{2}$, develops, approximately, 36 h.p., under 600 r.p.m., and is direct connected to a 20 k.w. compound wound differential pole generator. This combined unit is mounted on a rigid frame work of rectangular form, which is brought up from underneath the truck and mounted on a saddle or spring suspension in such a manner that the movement of the truck imparts but little strain or jar to the power plant. This method of suspension appears to be practicable, and, from an operating point of view, is satisfactory as to change or repair of equipment. The motors of this car are of the compound wound type, having a heavy series winding and are of approximately 25 h.p. each and are geared to the axle in the usual manner. These motors are so connected to the generator that it makes a very flexible unit and entirely eliminates the resistance, controller and cable methods. The connection between the generator and motors is such that as soon as the gas engine is accelerated the shunt fields of the motors are pre-energized before the armature circuits of the motors are closed. This gives a cushioning effect upon the motors without resistance, which is unattainable under the ordinary methods, and also gives a combination of units which, to a great degree, protects itself from the misuse of the operator. The later cars built, including the one being tried on the Schomberg and Aurora Ry., have 6 cylinders, 54 h.p. engine, 30 k.w. generator and two 25 h.p. motors, the selling price in the U.S. being about \$11,500.

How to Analyse Railroad Reports.—A book with this title, written by J. Moody, the editor of Moody's Analysis of Railroad Investments, has been issued by the Analysis Publishing Co., 35 Nassau street, New York, at the net price of \$2.50. It is written primarily from the standpoint of the investor in railway stocks, and gives in plain language the significance and meaning of every statement in the reports of railway companies, thereby enabling the investor to draw his own conclusions as to the value of the stock. The breadth of scope of the book is indicated by the fact, that after a general introduction there are chapters dealing with the physical, the income, and the capitalization factors, followed by an outline of uniform accounting requirements for operations of steam railways. The different points raised are illustrated by facts and figures gleaned from the reports of various companies, and Mr. Moody's wide experience in preparing his annual statistical analysis.

Dominion Government Railway to Hudson Bay.

Large quantities of material have been delivered at The Pas, Man., for the steel bridge which Mackenzie, Mann & Co. are building across the Saskatchewan river there for the Dominion Government railway to Hudson Bay. Tenders are being asked for the building of a freight shed at The Pas.

We are officially advised that the contract for the building of the 68 miles of line from Thicket portage to Split Lake junction, Man., has been let by the Department of Railways to J. D. McArthur, Winnipeg, who also has the contract for the building of the line from The Pas to Thicket portage, 185.5 miles.

Tenders were received to Sept. 12 for the completion of the line to Hudson Bay, either to Port Nelson, 165 miles, or to Fort Churchill, 245 miles from Split Lake junction. It is said that this contract will also be let to J. D. McArthur.

Hon. F. Cochrane, Minister of Railways, arrived in Sydney, N.S., Sept. 3, by steamship from Hudson Bay, which he reached July 28, having travelled by canoe from The Pas. At Port Nelson and Fort Churchill, he inspected the harbor facilities. We were officially advised, Sept. 18, that the press report that Port Nelson has been selected as the terminal was premature. "It may be," we are informed, "that Nelson will be selected," but no announcement had been made to Sept. 18.

Fifteen buoys and other equipment for aiding navigation at Port Nelson were shipped from Montreal by the s.s. Beothic, Sept. 7.

The Dominion Government has published a sessional return giving copies of all reports, surveys, etc., in connection with the railway to Hudson Bay, the suggested ports at Nelson or Churchill, and the navigation of Hudson straits. These give details of the navigation of the straits and bay, as prevailing during the season of 1911 and recorded by F. Anderson, during the voyages of the straits, and the schooners Clarissa C. Thorney and Burleigh; a report on the harbors at Port Nelson and Fort Churchill, prepared by A. G. Bachand and C. Savery, and H. S. Parizeau and R. Fraser respectively; and three reports by J. Armstrong, Chief Engineer of the railway. Neither of the reports gives any definite opinion as to the length of the navigation season, but they deal generally with the conditions as observed in the straits and bay, and in and around the two harbors. These reports confirm in many respects the observations of previous years as to the varying quantities of ice to be met with, and the difficulties of coming at any certain conclusions as to the period during which navigation may safely be carried on. That these conditions are more favorable some years than others is evidenced by the fact that preliminary reports from the investigating parties taking observations during the present season, indicate unusually bad ice conditions in the straits and bay. It may be gathered from all the reports at present received that the outlook for building up an ocean-carrying trade in and out of the bay, as the result of the building of the railway, is not very encouraging.

The three reports made by Mr. Armstrong set out an alternative plan by which the railway will be rendered a profitable proposition, the country through which it passes developed, and existing ports in Canada benefited. The first is a preliminary report; the second makes a comparison between the cost of building the

line to the two ports, in which it is shown that not only is the Port Nelson route the shorter by 80 miles, but that the country through which it passes is more capable of development, and that one line can be more economically operated. In the third report Mr. Armstrong shows how by linking up Hannah bay on the Quebec side of Hudson bay, by rail with Quebec, a combined rail and water route could be provided which would be shorter than the existing rail and water route via Fort William and the great lakes. At Fort Churchill there is a natural breakwater, but the navigable season is only from four to five months as compared with seven to eight months at Port Nelson. The initial development at Fort Churchill might be less difficult than at Port Nelson, but the latter place offers the best advantages for a development capable of handling from 50,000,000 to 60,000,000 bushels of grain. He concludes by recommending the development of Port Nelson.

In connection with this matter it may be noted that the Dominion Parliament and the Quebec Legislature have granted aid towards the building of a railway from Montreal to the mouth of the Nottaway river, in Hannah bay, and that the North Ry., of which F. H. Clergue is a leading promoter, is making surveys, with a view of starting construction in the spring. The Canadian Northern Ry. interests, through the charter of the James Bay and Eastern Ry. has under construction a line from Roberval, the terminus of the Quebec and Lake St. John Ry., to the mouth of the Nottaway river. It is also intended to extend the Ontario Government line—the Timiskaming and Northern Ontario Ry.—from its present terminus at Cochrane to Port Nelson, for which purpose a 10 mile strip of the territory recently given to Manitoba, with water frontage at Port Nelson, has been reserved to Ontario. This strip is now being selected by J. B. Tyrrell, who was at Port Nelson during the visit there of the Minister of Railways. (Sept. pg. 466.)

C.P.R. Orders for Rails and Fastenings.—

During this year the C.P.R. has bought 185,300 tons of steel rails, which, with the fastenings, 14,347 tons, and the tie plates, 6,500 tons, make a total of 206,147 tons. These new rails are chiefly of Canadian make—being the output of the Sault Ste. Marie and the Sydney mills, but small quantities were necessarily bought in the United States. They are nearly all 85 lb. rails, and the average cost is \$33 a ton, the whole order aggregating about \$7,000,000. When laid, these rails will extend 1,440 miles—practically from Montreal half-way across the continent, or would reach from St. John, N.B., to within a few miles of Port Arthur. To carry them to where they will be needed would require 137 trains—averaging 50 cars to the train—and this line of trains would, if placed one after the other, extend for 50 miles. The new rails will be utilized in the various new lines and extensions of existing ones that the company is building, and in replacing old rails where needed, which in turn will be used for sidings or sent to the scrap heap.

The Union Terminals Co., Winnipeg, has built a dock track for the Lake Superior Shipping Co. there. This is the first track of the kind built in the prairie provinces, and it is expected that others will be added before long.

D. E. Brown and Macaulay, Ltd., have been appointed ticket agents for the Oregon-Washington Rd. and Navigation Co. at Vancouver, B.C. D. E. Brown was formerly General Superintendent, C.P. Trans-Pacific steamship service, there.

National Transcontinental Railway Construction.

The intention, it appears, is to have the steel laid complete from Cochrane, Ont., to Winnipeg this season. R. W. Leonard, Commissioner, is reported as stating that there is an 80 mile gap between these two points. While it is expected to have the steel laid by the end of the season, it is considered doubtful whether one line can be got into such a condition that it will be possible to operate grain carrying trains over it.

The yards at Transcona, Man., have a capacity of 5,000 cars, and this can be increased as occasion requires. The finishing touches are being put to the yards by the J. D. McArthur Co., which has the contract.

Tenders are under consideration for piping systems, pipe tunnels, pipe coverings and wiring ducts required for the car shop plant at the Transcona shops. (Sept., pg. 465.)

Grand Trunk Pacific Railway Construction.

A. W. Smithers, Chairman of the Board, G.T.R., and E. J. Chamberlin, President G.T.R. and G.T.R. Ry., returned to Montreal, Sept. 9, after a trip of inspection over the G.T. Pacific Ry. In an interview Mr. Smithers is reported to have said, that as representing the British investors he was entirely satisfied with the manner in which progress had been made. The great difficulty in connection with the construction was the scarcity of men. The contractors could find work for from 4,000 to 5,000 more than were available. There was ample construction equipment on the ground, and if the men were available there was no doubt that the line through to the coast could be completed by the end of 1913. He was confident, however, that trains would be running through from Montreal to Prince Rupert by the end of 1914.

E. J. Chamberlin is reported to have stated that the line was inspected to the track end at Tete Jaune Cache, and the construction work inspected for some distance beyond. West of Tete Jaune Cache to Fort George, there were 25 steam shovels, 40 locomotives and other necessary equipment in operation. The party then returned to Edmonton, and went to Vancouver via the C.P.R., and on to Prince Rupert by steamship, thence they proceeded by train to the end of steel, 176 miles east of Prince Rupert. The work was so far advanced that it was expected to have the track laid further east to Aldermere, early in December, and to Bulkeley summit before work would be closed down for the season.

Edmonton press dispatches state that the Canadian Stewart Co., Montreal, is preparing to sublet portions of the work on the hotel at Edmonton, which is estimated to cost \$1,500,000. The specifications call for 12,000 barrels of cement, 6,000 yards of sand, 10,000 yards of gravel, and 1,500,000 bricks.

Reports from Edmonton, Alta., state that the following sub-contractors are at work between Tete Jaune Cache and Fort George:—Carlton and Co., 25 miles; Griffin and Co., 43 miles; Spend and Co., 25 miles; Simmons and Co., 50 miles. These four contractors are operating 22 steam shovels. Thirty-two large and small steel bridges will be constructed between Resplendant and Fort George. After leaving Tete Jaune Cache the road will cross the Fraser river four times before reaching the fort. The first of these bridges is 47 miles below the present railhead. At the canyon, 65 miles

farther west, the survey crosses the river twice within a few miles, recrossing it at the canyon. There is also a bridge at Resplendant, making five spans over the Fraser river. A long bridge will cross the Shuswap river and one must be built over the Ghost river before trains are run into Fort George. Reports from Fort George state that a contract has been let for the clearing of 50 acres on the Nechaco river, Fort George, for yard purposes, and that work was started thereon, Sept. 5.

W. C. C. Mehan, General Superintendent at Prince Rupert, reports that all station buildings on the main line east of that city are completed as far as Van Arsdol. These are at Kaen, Phelan, Sock Eye, Tyee, Manu, Kwinitsa, Salvus, Exsrew, Shames, Amsbury, and Terrace, respectively. A 50,000 gallon permanent water tank has been located at Kwinitsa, at mileage 46, and one at Van Arsdol. New stations are in course of construction at Usk, Pitman, Hallwood and new water tanks at Nichol and Kitwanger. Stations are going up at all permanent sidings and water tanks wherever necessary. Station facilities will be complete to Hazelton shortly after the steel reaches that point. Permanent steel bridges are also complete at mileage 55, Kaitsik river, mileage 92, and Kitsumkalum river. Those still under construction are at mileage 60, Exchomsiks, mileage 87, and Zimquad river.

The Board of Railway Commissioners has authorized the opening of the line for traffic from mileage 100 to 164 east of Prince Rupert, and a later report states that owing to the low level of the water in the Skeena river, special permission has been given to operate trains as far as mileage 176, the Sceley gulch crossing. It is expected that the line will be completed into Haslemere early in October.

GRAND TRUNK PACIFIC RAILWAY BRANCH LINES.

The Board of Railway Commissioners has approved of revised location plans from mileage 12.71 to 18.48, and location plans from mileage 18.48 to 21.86, of the branch line from Harte to Brandon, Man.

The line from Regina to the International boundary near Portal, Sask., 134 miles, has been completed so far as the grading and building of structures is concerned. It was reported that 33 miles of steel had been laid to Aug. 30, and it is expected to have the whole mileage laid and ballasted by Dec. 1. At the International boundary the line will connect with a line of 22 miles, being built northerly from Niobe, N.D., by the Great Northern Ry. It is said that the G.T. Pacific Ry. trains will run through over the G.N. Ry. and its connections to Chicago, Ill., where the G.T.R. will take over the traffic.

The Board of Railway Commissioners has approved of location plans for the branch line from Regina to Moose Jaw, Sask., between mileage 40.01 and 47.74. The Mayor of Moose Jaw was advised by M. Donaldson, Vice President and General Manager, Sept. 3, that the right of way through Moose Jaw was being purchased, and when this had been arranged construction would be continued. The route has been approved by the Board of Railway Commissioners.

The Board of Railway Commissioners has authorized the opening for traffic of a further section of the Young-Prince Albert branch, between mileage 45.5 and 67. This extension carries the branch to Wakaw, Sask., and the remaining 57 miles are under construction.

Plans for the entrance of the branch line from Oban into Battleford, Sask., have been approved by the council. A yard is to be laid out, and the buildings will include a

three-stall engine house, station and freight-shed. An industrial spur track will be laid along the lane between 18th and 19th streets to 2nd avenue.

It is reported that on the branch from Battleford into the Cutknife district considerable progress has been made with grading, and that it is expected to have several miles of steel laid this season.

The Board of Railway Commissioners has approved of location plans for the line in Alberta, between mileage 27.67, at the north line of sec. 8, tp. 20, range 28, west of the 4th meridian, to mileage 111.29, at the west line of the northwest quarter of section 34, tp. 11, range 23, west of the 4th meridian. We are officially advised that the contract for the building of this line—a branch from Calgary to Lethbridge—has not yet been let. (Sept., pg. 465.)

Railway Finance, Meetings, Etc.

Alberta Ry. and Irrigation Co.—A duplicate original mortgage made between the A. Ry. and I. Co., the C.P.R. and the Royal Trust Co., securing an issue of bonds by the first named company, has been deposited with the Secretary of State at Ottawa.

Canadian Northern Ry.—There has been deposited with the Secretary of State at Ottawa an indenture dated June 20, made by the C.N.R. Co. to the National Trust Co. and the British Empire Trust Co. as trustees, and the Province of Alberta, being the first supplementary instrument in respect of an additional line of railway, supplementary to the indenture of June 10, 1909, securing 4% stock and bonds guaranteed by the Province of Alberta.

Canadian Northern Ontario Ry.—The name of the James Bay Ry. Co. has now been dropped, and the property incorporated with that of the C.N.O. Ry. The officers and directors for the current year are:—President, Sir William Mackenzie; Vice President, Sir Donald Mann; Third Vice President, D. B. Hanna; Secretary, W. H. Moore; Treasurer, L. W. Mitchell; other directors, Z. A. Lash, F. Nicholls, R. M. Horne-Payne; Assistant Secretary, R. P. Ormsby.

Duluth, South Shore and Atlantic Ry.—The report for the year ended June 30, shows revenue from transportation, \$3,125,853.22; from other than transportation, \$26,621.81; total operating revenue, \$3,152,475.03; operating expenses, \$2,395,160.78; net operating revenue, \$757,314.25; net revenue from outside operations, \$3,358.32; net revenue, \$760,672.57; less taxes accrued, \$217,417.86; operating income, \$543,254.71; other income, \$38,763.99; gross income, \$582,018.70; less interest, etc., \$943,565.71, thus showing a net loss of \$361,547.01. The expenditures on additions and betterments during the year, were \$91,528.14.

Massawippi Valley Ry.—The annual meeting was held Sept. 4. The following officers and directors were elected for the current year: President, J. G. Foster, Ottawa, Ont.; Vice President, C. W. Cate, Sherbrooke, Que.; other directors, C. D. White, F. N. McCrea, E. O. Grundy, Sherbrooke, Que.; C. H. Kathan, Rock Island, Que.; J. W. Dunklee, Boston, Mass.; J. H. Williams, Bellows Falls, Vt.; H. E. Folsom, Lyndonville, Vt.

Pere Marquette Rd.—S. M. Felton, Chicago, Ill., has been appointed a receiver, in succession to N. Erb, resigned.

Quebec and Saguenay Ry.—The annual meeting was held at Quebec, Sept. 17, when nothing but routine business was done. Following are the directors and officers for the current year:—President, O. B. Daoust; Vice President, H. G. Matthews, Manager Quebec Ry. Light and Power Co.; other

directors, Sir Rodolphe Forget, L. G. Morin and L. E. Morin.

Quebec Central Ry.—Gross earnings for June, \$153,030.78; expenses, \$117,419.85; net earnings, \$35,610.93, against \$129,359.06 gross earnings; \$84,228.34 expenses, \$45,130.72 net earnings, for June, 1911. Aggregate gross earnings for 12 months ended June 30, \$1,354,811.41; expenses, \$943,976.36; net earnings, \$410,835.05, against \$1,208,948.88 aggregate gross earnings; \$820,803.12 expenses; \$388,145.76 net earnings for same period 1910-11.

St. Marys and Western Ontario Ry.—The first lease under which this line was operated by the C.P.R. Co., was only a tentative one, on a percentage basis. This has been superseded by a lease for 999 years at a rental equal to the interest on the bonds which have been issued.

Temiscouata Ry.—Profit on operation for June, \$8,057.

White Pass and Yukon Route.—W. B. Close, Chicago, Ill., of Close Bros. & Co., who represents the British shareholder, is reported as stating at Vancouver, B.C., Sept. 16, that the company proposes extending its steamboat service down the Yukon river to Fairbanks, Alaska, about 600 miles, and to establish a chain of hotels along the river. He is also reported to have said that there is no truth in the press reports, originating in Alaska, that the company had sold its railway, etc., to the Grand Trunk Pacific Ry. Co.

Wisconsin and Michigan Ry.—The Minneapolis, St. Paul and Sault Ste. Marie Ry. has not, as press reports state, acquired this railway. The line was originally built by J. R. Walsh, passed into the hands of receivers, and was purchased at a mortgage sale some months ago by John Marsh. The W. & M. Ry. operates over 135.7 miles, connecting up Iron Mountain, Peshtigo harbor and other points, and connects with the M. St.P. & S.S.M. Ry. at Peshtigo jet., Mich. It owns nine locomotives, 8 passenger cars, 303 flat cars, 37 box cars and 10 refrigerator cars.

Maintenance of Way by Contract.

Contracting maintenance of way work on railroads is being taken up on a constantly broadening scale by a number of engineering departments in the United States, and is a practice which offers many advantages to the railways and opens an attractive field for contractors. Most new lines are now built under the contract system, and it is being found that the economy of that plan does not necessarily end with the completed roadway, but that much of the annual routine work of upkeep may also be included. Ballasting has been extensively carried out in this way, tie renewals are being taken up, painting of structures has been found to work out favorably, and moving of right of way and work of like character offer further applications of the plan. Such items as these lend themselves readily to performance by contract forces under a railway inspector, who in many cases may be one of the foremen. The experience and records of every railway furnish a basis for specifications and estimates for the work, which should insure not only the desired results for the company, but such favorable working conditions for the contractors as to invite a satisfactory number of bids. With the actual conduct of the work in the hands of contractors, the work of the engineering department is considerably simplified. The organization and maintenance of large temporary forces alone is a considerable tax on that department and is something for which the contractor is often better equip-

ped. The latter must always necessarily have a number of sources of supply developed, and also usually has a fixed following of greater or less extent. The work presents inducements to the contractor because of the absence of elements of great risk which attend much new construction, and also on account of its regularity and the possibility of taking it along with other contracts to balance the year's operations and to keep up the central organization. A consideration from the point of view of the railway, in connection with work done by local contractors, is that a large proportion of the money expended remains in the railway territory to develop it, instead of being carried out to other sections or sent abroad.

Great Northern Railway Lines in Canada.

United States Connections.—We are officially advised that the G.N. Ry. is building a line from Niobe, N.D., for 21 miles to the International boundary, near Minot, where it will connect with the line under construction by the G.T. Pacific Ry. from Regina, Sask. It is expected to have the line completed by Oct. 31. J. J. Hill is reported as having stated in New York that the G.T.P. Ry. will run its own trains to Minot, whence they will be hauled by the G.N. Ry. to Minneapolis and St. Paul, Minn., and thence to Chicago, Ill., by the Chicago, Burlington and Quincy Rd., controlled by the G.N. Ry. and Northern Pacific Ry. The trains will be delivered over to the G.T.R. at Chicago. The line from Niobe to the boundary is being built by A. A. Guthrie & Co.

Vancouver, Victoria and Eastern Ry. and Navigation Co.—The spur line to the cement works at East Princeton, B.C., has been completed, and is in operation.

Tenders are under consideration for the building of 40 miles of line from Coalmount to Coquihalla summit in the Hope mountains. The estimated cost of this piece of line is \$1,500,000, and the contract will call for its completion by July, 1913. From near the summit a joint line is to be built to Hope, in conjunction with the Kettle Valley Ry. It has not been arranged which company is to build the line, but whichever it is the other is to have equal operating rights.

The Board of Railway Commissioners has authorized the company to open its line for traffic from Abbotsford easterly to Kilgard.

Considerable trouble is being experienced with a sink hole near Ardley, about five miles east of Vancouver. The trouble was believed to have been remedied, when, on Sept. 4, owing to heavy rains, the track sank about 5 ft. for 300 yards. It is intended to drive piles down to the rock, and to erect a large timber trestle over the soft place.

A proposition is under consideration for building a second track on the line from Vancouver to New Westminster. (Aug., pg. 414.)

The Fort William Dock Co. has completed the erection of another large steel coal handling tower at its dock on the Mission river, Fort William, Ont. The new structure will be able to unload 3,000 tons of coal a day from boats, and is operated by electricity. This addition, which cost \$125,000, gives the company a total unloading capacity of 6,000 tons a day.

The C.P.R. has ordered 1,500 standard 40-ton steel frame box cars, from the National Steel Car Co.

Transportation Appointments Throughout Canada.

The information under this head, which is almost entirely gathered from official sources, is compiled with the greatest care, so as to ensure absolute accuracy. Anyone who may notice any error in our announcements will confer a favor by advising us.

Algoma Central and Hudson Bay Ry.—W. M. HUGILL, heretofore Chief Dispatcher, has been appointed acting Trainmaster and Car Accountant, vice J. W. Herrold, resigned. Office, Taganah, Ont.

E. P. SUGAR, heretofore dispatcher, has been appointed Chief Dispatcher, vice W. M. Hugill, promoted. Office, Sault Ste. Marie, Ont.

W. GOTRO has been appointed dispatcher at Sault Ste. Marie, Ont., vice E. P. Sugar, promoted.

Canadian Northern Ry.—ALAN FRASER, B.A. Sc., has been appointed an assistant engineer on Mackenzie, Mann and Co.'s Toronto staff, his principal work being the design of masonry and steel bridges.

Canadian Pacific Ry.—F. G. MILLEN, heretofore chief clerk, Secretary's office, has been appointed Assistant Treasurer, vice E. Alexander, appointed Assistant Secretary, as announced in our last issue. Office, Montreal.

G. I. EVANS, heretofore Mechanical Engineer, Angus locomotive shops, has been appointed Superintendent of Angus locomotive shops, Montreal, vice H. Osborne, recently appointed Assistant Superintendent of Motive Power.

W. H. WINTERROWD has been appointed Mechanical Engineer, Angus shops, Montreal, vice G. I. Evans, promoted.

A. RUTLEDGE, heretofore Superintendent, Sleeping, Dining and Parlor Cars and News Service, district 1, lines east of Toronto and Sudbury, Ont., has been appointed Assistant to General Superintendent, same department. Office, Montreal.

J. B. GRAY, heretofore Assistant Superintendent, Sleeping, Dining and Parlor Cars and News Service, district 1, east of Toronto and Sudbury, Ont., has been appointed Superintendent, same district, vice A. Rutledge, promoted. Office, Glen Yard, Montreal.

F. M. BREEN has been appointed Assistant Superintendent, Sleeping, Dining and Parlor Cars and News Service, district 1, lines east of Toronto and Sudbury, Ont., vice J. B. Gray, promoted. Office, Glen Yard, Montreal.

J. H. HUGHES, heretofore Superintendent, District 3, Lake Superior division, Schreiber, Ont., has been appointed Assistant Superintendent, District 2, Eastern division, vice C. W. Lott, transferred. Office, Smiths Falls, Ont.

L. O. TREMBLAY has been appointed Travelling Passenger Agent, North Bay, Ont., vice J. J. Anderson.

C. W. LOTT, heretofore Chief Dispatcher, district 2, Eastern division, Montreal, has been appointed Assistant Superintendent, district 2, Lake Superior division, Chapleau, Ont., vice E. J. Brien, transferred.

J. H. BROOKS, heretofore acting District Master Mechanic, North Bay, Ont., has been appointed District Master Mechanic, district 2, Lake Superior division, White River, Ont.

A. BROWN has been appointed Locomotive Foreman at Fort William, Ont., vice —, McArthur, transferred.

W. PIMLOTT has been appointed Storekeeper at Fort William, Ont., vice W. Colbourne, resigned.

W. J. FIDLER, heretofore clerk, has been appointed Storekeeper at Kenora, Ont., vice D. S. Schofield, transferred.

P. F. WEISBROD, heretofore Superintendent, district 2, Saskatchewan division, Moose Jaw, has been appointed Trainmas-

ter, district 2, Manitoba division, Winnipeg, vice J. M. McKay, transferred.

J. B. McTAGGART, heretofore Bridge and Building Master, Moose Jaw, Sask., has been appointed Superintendent, district 2, Saskatchewan division, vice P. F. Weisbrod, appointed Trainmaster at Winnipeg. Office, Moose Jaw.

J. BAIRD, heretofore Foreman, Bridge and Building Department, Moose Jaw, Sask., has been appointed Bridge and Building Master there, vice J. B. McTaggart, promoted.

R. COOPER, heretofore Assistant Car Foreman, Moose Jaw, has been appointed Car Foreman there, vice J. B. Shelton, resigned.

A. J. IRONSIDES, heretofore locomotive driver, Saskatoon, Sask., has been appointed District Master Mechanic, district 4, Saskatchewan division, Saskatoon. This is a new position on account of the opening of an additional district.

A. C. HARSHAW, heretofore Trainmaster, Macleod, Alta., has been appointed Superintendent, Calgary Terminals.

W. J. UREN, heretofore Superintendent, district 3, Alberta division, Cranbrook, B.C., has been appointed Superintendent, district 2, Alberta division, vice C. S. Maharg, on leave of absence. Office, Calgary. On Mr. Maharg's return he will be appointed Superintendent, Calgary Terminals, vice A. C. Harshaw, who will take a vacation, after which he will receive another appointment.

G. GLASFORD, heretofore Road Foreman, Calgary, Alta., has been appointed District Master Mechanic, district 2, Alberta division. Office, Calgary.

J. M. MCKAY, heretofore Trainmaster, Winnipeg, has been appointed Trainmaster, district 1, British Columbia division, vice H. W. McLeod. Office, Revelstoke.

D. S. SCHOFIELD, heretofore storekeeper at Kenora, Ont., has been appointed storekeeper at Nelson, B.C.

Dominion Atlantic Ry.—J. H. YOULD, heretofore Foreman of Shops, has been appointed Superintendent of Motive Power, vice W. Yould, retired from the service. Office, Kentville, N.S.

Duluth, South Shore and Atlantic Ry.—J. C. BEBB, formerly of the Michigan Central Rd. engineering department, Bay City, Mich., has been appointed office engineer in the bridge department, D.S.S. & A.R., Duluth, Minn., and not Assistant to Chief Engineer, vice N. Cadarette, according to the report mentioned in our last issue.

G. MERCER has been appointed Superintendent of Bridges and Buildings, vice W. M. Noon, resigned. Office, Duluth, Minn.

Grand Trunk Pacific Ry.—S. P. PORTER, formerly Deputy Minister of Railways, Telegraphs and Telephones for Saskatchewan, has been appointed Executive Agent, G.T.P.R. He will make land purchases, do other special work in Saskatchewan, and carry out other duties that may be assigned to him by the Vice President and General Manager. Office, Regina, Sask.

J. ASHCROFT has been appointed Road Foreman, Transcona to Melville and Yorkton branch.

W. E. MOHER has been appointed Road Foreman, Regina branch and district 3, Melville to Watrous, Sask.

C. D. SMITH has been appointed Road Foreman, from Watrous to Biggar, including Oban-Battleford and Biggar-Calgary branches, reporting to Road Foreman of Locomotives, Wainwright, Alta.

The following agents have been appointed:—G.T.P. Junction, Man., C. W. Jaminette; Kelliher, Sask., H. H. Lyle; Mirror, Alta., J. H. Holman; and stations have

been opened, with agents, as follows:—Edenwold, Sask., J. J. Burns; Otthorn, Sask., L. Mullins; Bruce, Alta., P. L. Harper; Tete Jaune, B.C., L. C. Pearson.

Grand Trunk Ry.—The following agents have been appointed:—Campbellford, Ont., R. C. Johnston; Bethany, Ont., M. M. Wier; Stoney Point, Ont., J. W. LeGallais; Goldstone, Ont., R. D. Ranney; Noyan Jct., Que., J. S. Chenail; outside agency closed at Arthabaska, Que.

Grand Trunk Ry., Grand Trunk Pacific Ry.—F. W. BERGMAN has been appointed Manager of Hotels, G.T.R. and G.T.P.R., with headquarters for the present at Ottawa. He was on Nov. 15, 1910, appointed Manager of the Chateau Laurier, Ottawa, and in March, 1912, was appointed Manager-in-Chief of Hotels. The present appointment appears therefore to be merely a change of title.

Hudson Bay Ry.—J. V. DILLABOUGH, heretofore office engineer, district F, National Transcontinental Ry., has been appointed office engineer of the Dominion Government railway to Hudson Bay, Winnipeg.

Intercolonial Ry.—B. F. SHORTLEY, heretofore operator and assistant to Terminal Agent, at Montreal, has been appointed Terminal Agent there, vice H. B. Sample, deceased.

Michigan Central Rd.—E. A. WIGREN, heretofore Auditor of Disbursements, has been appointed Assistant Auditor, vice N. B. Ackley, resigned to engage in other business. Office, Detroit, Mich.

R. R. RICHARDS has been appointed Auditor of Disbursements, vice E. A. Wigren, promoted. Office, Detroit, Mich.

F. W. SPARLING has been appointed Assistant Auditor of Disbursements. Office, Detroit, Mich.

Minneapolis, St. Paul and Sault Ste. Marie Ry.—H. B. DIKE, General Solicitor, is reported to have been appointed Assistant to the President, with office at Minneapolis, Minn.

B. NOBLE has been appointed Travelling Passenger Agent, New York City.

H. C. BURNETT, Jr., has been appointed Travelling Freight and Passenger Agent, Edmonton, Alta., vice C. H. Dodd.

National Transcontinental Ry.—W. B. CRONK, formerly Superintendent, G.T. Pacific Ry., Regina, Sask., has been appointed Superintendent of Transportation, National Transcontinental Ry., his immediate jurisdiction being over the Transcona-Superior Jct. section, and it will probably be extended to include other portions of the line as they are put in operation. He will report to the Assistant to the Chairman of the N.T.R. Commission. Office, Winnipeg.

Pere Marquette Rd.—E. N. WELLER has been appointed acting Treasurer for the Receivers, vice J. E. Howard, Secretary and Treasurer, deceased. Office, Detroit, Mich.

Toronto, Hamilton and Buffalo Ry.—H. J. VAN VLECK has been appointed Assistant Auditor, vice N. B. Ackley, resigned to engage in other business. Office, Detroit, Mich.

R. R. RICHARDS has been appointed Auditor of Disbursements, vice E. A. Wigren, appointed Assistant Auditor, Michigan Central Rd. Office, Detroit, Mich.

Wabash Rd.—G. R. LAYHER has been appointed Superintendent of Weighing and Handling of Freight. He will have supervision over the weighing and handling of all freight and will take proper action to enforce the rules relating thereto. Superintendents, trainmasters, agents, yardmasters and others are directed to co-operate with him for the purpose of having the rules properly observed. Office, St. Louis, Mo.

Among the Express Companies.

The Canadian Northern Ex. Co. has opened
offices at Fiske, and Blaine Lake, Sask.

J. Richardson has been appointed line
auditor, Dominion Ex. Co.'s eastern lines,
with territory east of Port Arthur, Ont.
Office, Toronto.

M. W. Hastie, heretofore route agent,
Dominion Ex. Co., Calgary, Alta., has been
appointed superintendent there, with super-
vision of the offices in Alherta.

L. D. Oakley has been appointed line
auditor in charge of the Dominion Ex. Co.'s
western lines, covering territory west of
and including Port Arthur, Ont. Office,
Winnipeg.

The Canadian Northern Ex. Co. has is-
sued its transfer tariff covering points in
Ontario, the rates shown on which must
be used to compute the through charges on
shipments destined to offices of other com-
panies to which through rates have not
been furnished, applying only from its
offices. Shipments originating at the com-
pany's offices must be waybilled through to
destination, and routed through the trans-
fer point nearest to, but short of destina-
tion, and charges computed in accordance
with the rules of Official Express Classifica-
tion 21.

The express business in the United States
has been the subject of a thorough investi-
gation by the Interstate Commerce Com-
mission, and the report of the Commission
recently filed will result in marked reduc-
tions in express rates and notable changes
in methods of conducting business, unless
at the hearings, which commence Oct. 9,
the express companies are able to show
cause why the orders should not go into
effect. The rates proposed by the Commis-
sion are based on a block or zone system,
each block being about 50 miles square and
the U. S. containing altogether 950 blocks.
The rates are made for packages weigh-
ing from 1 to 100 lbs. between each zone
and every other zone or block, the rate
being the same for all cities within a block.
The express companies will be required to
publish a directory of express stations,
showing the number of the block in which
each station is located, and at every sta-
tion there must be filed a single sheet tariff
giving the rates from that station to every
one of the 949 other blocks. The sheet
must also state the local free delivery
limits. For light-weight parcels the pro-
posed reductions are considerable. The
Commission will also insist on the most
direct routings.

NEW METHOD OF HANDLING PREPAID PARCELS.

The Canadian Ex. Co. has recently
adopted throughout its entire system of
railway and steamship lines a plan having
for its object the prevention of double
collection of charges at destination when
shipments have already been prepaid, the
prevention of overcharges and undercharges,
and the elimination of the occurrence of
packages going astray or being found over
without mark, resulting in delay in deliv-
ery and inconvenience and loss to the pub-
lic. The foundation of this new plan for
the correct receiving, billing and handling
of shipments is the fact that waybills and
package labels of distinctive colors are
used. For example, all packages, the
charges on which are to be prepaid, will
bear a label printed on golden red paper.
This served as a warning to all employes
that charges are not to be again collected.
Where charges are to be collected at des-
tination a white paper label is used; for
c.o.d. shipments green paper, and for ship-
ments in bond pink paper labels. Waybills
printed on paper of corresponding colors

will also similarly distinguish the one class
of business from the other. A waybill is
made in triplicate for every consignment,
one copy which contains full particulars
of consignee, address, weight and charges,
being pasted on the package; one copy
being handed to the train messenger in
whose custody the package is forwarded,
and one copy retained for office use. For
mutual convenience special arrangements
are made with large or regular shippers to
supply them with labels to be attached to
shipments in advance of the call of the
driver. Where a consignment consists of a
number of packages a special "lot ship-
ment" label is placed upon each package,
which gives reference to the entire con-
signment. This it is expected will prevent
packages which are a part of a consignment
from going astray, and will go a long way
towards removing the difficulty which the
public have heretofore experienced. A
similar system was put in force by all the
express companies in the United States on
Sept. 1, but we are officially advised that
the Dominion Ex. Co. and the Canadian
Northern Ex. Co. have decided not to adopt
it at present.

The plan which has been adopted by the
companies in the United States is in accord-
ance with an order by the Interstate Com-
merce Committee, and while the Canadian
Ex. Co. is following the same plan the Do-
minion and Canadian Northern Ex. Co.'s
managements are of opinion that it will be
subject to some, if not many changes, before
it is perfected. In the meantime they prefer
not to introduce it, but will promptly adopt
any good features that may be developed
after it has been tried.

Trade and Supply Notes.

The matter which appears under this heading
is compiled, in most cases, from information sup-
plied by the manufacturers of, or dealers in,
the articles referred to, and in publishing the
same we accept no responsibility. At the same
time, we wish our readers to distinctly under-
stand that we are not paid for the publication of
any of this matter, and that we will not consider
any proposition to insert reading matter in our
columns for pay or its equivalent. Advertising
contracts will not be taken with any condition
that accepting them will oblige us to publish
reading notices. In other words, our reading
columns are not for sale, either to advertisers
or others.

The Brown Hoisting Machinery Co.,
Cleveland, Ohio, has issued its catalog E,
describing and illustrating the Brownhoist
grab, slag contractors' grab, drag line and
shovel buckets, and various kinds of tubs,
showing the various manners in which they
are utilized in steam and electric railway,
and general contracting work, coaling and
other similar plants.

The Detroit Lubricator Co., Detroit, Mich.,
and Windsor, Ont., has issued a general
catalogue of 232 pages, which deals, among
many other things, with new locomotive
lubricators, with oil control valve, air cylin-
der lubricators, boiler valves, throttle valves,
etc. Complete repair part lists are given
for all the company's locomotive lubricators,
with instructions for installation, opera-
tion and care. While this catalogue is
complete in some respects as regards loco-
motive lubrication, it was impossible, ow-
ing to lack of space, to include all the in-
formation contained in the company's Bulls-
eye Locomotive Lubricator Catalogue, a
new edition of which is on the press.

Anticosti Island Ry.—This line, which
runs from Ellis bay for 15 miles into the
interior of Anticosti island, Que., has been
built by the owner of the island, Henri
Menier, of Paris, France, for logging pur-
poses. It is standard gauge and has 4 loco-
motives, 1 passenger car, 20 dump cars, and
1 steam shovel.

Canadian Northern Railway, Construction, Betterments, Etc.

James Bay and Eastern Ry.—The Board of Railway Commissioners has approved of location plans for a further section of this line, now under construction from Roberval, Que., at the terminus of the Quebec and Lake St. John Ry., between mileage 30.7 and 31.4.

Canadian Northern Quebec Ry.—Application is being made to the Board of Railway Commissioners for approval of location plans for a line from Rawdon to St. Donat, Montcalm county, about 40 miles. Surveys are reported to have been completed for the line from Rawdon through Chertsey, Ste. Emilie and Notre Dame de Mercie.

Montreal Tunnel and Terminal Co.—It was expected, Sept. 12, that the negotiations between the company and the city authorities with respect to the lines between the tunnel portal and the water front would result in an arrangement being arrived at by the end of the month. It is said that the plan will provide for an overhead line from the station at LaGauchetiere street to the water front, as proposed by the company, to be built of steel and concrete, and that the track will be laid in a material which is calculated to reduce the noise of the traffic to a minimum. The overhead construction of the line to the water front, the company's representatives informed the board of control, is an essential part of the plans, as it is intended to carry the line across the river to the south shore at some future time.

It was reported Sept. 19 that boring of the tunnel was progressing at the rate of 20 ft. a day at the back of the mountain and 15 ft. a day on the city side. A 240 ft. shaft is being driven in the vicinity of Maplewood Ave., Westmount, and as soon as this has reached the level it will be possible to have four gangs at work driving the tunnel. It is expected that 20 ft. a day will be driven by each gang.

Montreal-Ottawa-Port Arthur Line.—The Minister of Railways has approved general route map for the C.N. Ontario Ry. lines on Montreal Island, 17 miles in length. These lines will form part of the through line, the Montreal-Hawkesbury section of which is under construction.

The taxpayers of Pembroke, Ont., have passed a bylaw granting \$25,000 cash bonus, free water and exemption from certain taxes, in return for which the town will be made a divisional point on the line.

The Board of Railway Commissioners has approved of revised location plans for the line through Westmeath and Pembroke tps.; through White, Fitzgerald, Deacon, Lister and Boyd tps., mileage 265.34 to 285.53 from Montreal; through Boyd and Pentland tps.; southerly from Capreol Jct.; through Alice and Fraser tps.; through unsurveyed territory Algoma district, mileage 268.03 to 269.3, and mileage 271.53 to 274.16 from Port Arthur.

Canadian Northern Ontario Ry.—The Board of Railway Commissioners has approved of revised location of the line in Camden tp., and has authorized the operation of traffic between mileage 145.83 and 149 and between mileage 152.13 and 152.72.

Plans have been filed with the Toronto city authorities showing how it is proposed to connect the Toronto-Ottawa line and the Toronto-Sudbury line with the new union station in North Toronto. The plans include provision for a new joint station about 2.5 miles east of Leaside Junction, and a steel girder bridge which will carry the Ottawa-Toronto line connection over the Don river.

The C.N.O.R. and the C.P.R. trains will run east together from North Toronto

station as far as the west Don river, which will be crossed by means of the present bridge, which is to be double-tracked. Immediately east of this the C.N.O. Ry. will deviate, and its own tracks will branch out, that to the north passing under the C.P.R. tracks about 200 yards to the west of the C.P.R. Don bridge, and then connect with the existing line where it emerges over the Don valley, while the Ottawa-Toronto line will run easterly, crossing the Don river on a steel girder bridge about 500 yards farther down the river than that of the C.P.R., after which the line will run out towards the present line, connecting with it in close proximity to the G.T.R. Scarboro Junction station.

In connection with the line west of Toronto it is reported that contracts will be let for the section from Toronto to Hamilton at an early date, and that grading will be completed this year from Poplar Plains road, North Toronto, to the west side of the Humber river at Lambton. The final questions in connection with the route to and through Hamilton are being rapidly settled, and there is little doubt, Hamilton city officials state, that contracts will shortly be let for the work. As to the company's construction intentions from the Niagara peninsula westerly to Windsor and Sarnia, there are numerous rumors. While the company has engineers in the field looking over routes, nothing definite has been decided as to what lines to build or what places they will serve, except that a line will be built from the vicinity of Hamilton via Brantford and London. Sir Wm. Mackenzie is reported as stating that the Toronto-Hamilton line will be started soon, and that it will be pushed forward towards Niagara Falls in the spring, that the surveys have all been completed and that construction will be rushed. He added that the company has not been purchasing land at Windsor for terminal purposes, as the question of extending the lines to Detroit is a question for the future and has not yet been given consideration.

Canadian Northern Ry.—Speaking of the plans for the cut-off across Winnipeg, to which considerable opposition has developed, Sir Wm. Mackenzie is reported to have stated, Sept. 5, that the route proposed is the best that can be adopted from a railway point of view, and that the company is not considering any alternative route.

Satisfactory progress is reported to have been made with construction on the line along the east shore of Lake Winnipeg. A train service has been put on the line as far as Inwood, on the western side of the lake, about 45 miles from Grose Isle, Man. This line, it is reported, is to be extended at an early date for a further distance of 45 miles. Press reports state that the lines on both sides of the lake are to be continued until they effect a junction at the head of the lake, when it will be decided whether an extension to Hudson bay is desirable or not.

Plans are reported to have been prepared showing considerable alterations and improvements to the station and freight sheds at Brandon, Man.

General Manager and Chief Engineer M. H. MacLeod has informed the mayor of Moose Jaw, Sask., that instructions have been given to have the line completed into that place as soon as possible.

The Board of Railway Commissioners has approved of location plans for the C.N.R. through tps. 22-19, range 29-28, west of the 4th meridian, mileage 13.21 to mileage 31.40; and through tps. 19-15, range 29-26, west of the 4th meridian, mileage 31.40 to 65.05.

Sir Wm. Mackenzie is reported to have stated in Calgary, Alta., Sept. 3, that he expected track would be laid into that city by Nov. 15. The grading was completed right into the city, and the track-laying gang had got to within 57 miles of the city. The line is coming in on the Second street west side of the south end. Sir William added that a large dead-end station would be built.

The Board of Railway Commissioners has approved of the station site and track layout at Calgary. Plans of the several buildings proposed to be erected have been submitted to the Calgary city council. Press reports state that a contract has been let to John Gunn and Sons, Winnipeg, for the building of the superstructure of a bridge across the Bow river in Calgary.

We are officially advised that a contract has been let to the Northern Construction Co. for the building of the Calgary-Macleod branch. The Board of Railway Commissioners has approved location plans for the line through Macleod, mileage 102.05 to 104.26.

Grading is being proceeded with on the line from Oliver to St. Paul de Metis, about 11 miles being practically ready for the track. It is expected to have 20 miles graded by the end of the season.

Another branch line out of Edmonton, on which grading is being done, starts from Onoway in the direction of the Peace river. The right of way is cleared to the crossing of the Athabasca river, and it is expected to have track laid to Whitecourt, 32 miles from Onoway, by the end of the year.

The Board of Railway Commissioners has authorized the opening for traffic of the line from Morinville to Athabasca Landing, Alta., 72 miles, and a train service was put in operation Sept. 2.

West of Edmonton to the British Columbia boundary, grading has been completed to Hinton, 175 miles west of Edmonton, and track has been laid to Entwistle. The superstructure of the high level bridge across the Pembina river is expected to be completed early in October, when the bridge building gang will move on to the McLeod river crossing. It is expected that steel will be laid to that point by the end of the year. Two-thirds of the grading has been done between Hinton and Fiddle creek, 40 miles, and work is in progress on the 50 miles from Fiddle creek to the summit. It is expected that track will be laid to the summit by May, 1913.

Canadian Northern Pacific Ry.—A contract has been entered into between the company and the Department of Railways, under the act passed last session of the Dominion Parliament, granting aid for the construction of a line from the Yellowhead pass to the mouth of the Fraser river, B.C., 525 miles.

C. V. Cummings, Secretary-Treasurer, Northern Construction Co., is reported as stating in Edmonton, Alta., Sept. 10, that all contracts had been awarded in connection with the building of the main line between Edmonton and the Pacific coast. Grading is expected to be completed as far west as Kamloops by the end of 1913.

Among the contractors reported to be at work on sections of the line, under the general contractors, are:—Phelan and Shirley, Palmer Bros., and Henning, Vancouver; J. Hogan, Edmonton, Alta.; Twoby Bros., McDonald Bros., Boyd and Craig, Murdoch and Co.

We are officially advised that the surveys for the location of the branch line from near Kamloops to the Okanagan valley are being rapidly pushed forward, and it is expected to have the route settled at an early date. Contractors have been looking over the approximate route with a view to tendering.

Rapid progress is being made with construction in Yale district. The 2,108 ft. tunnel near Yale is expected to be completed early in October. The contract for eight bridges and trestles, east of Yale, Rigby and Marsden, Vancouver, has been cancelled, and the work entrusted to Boyles and Co., Vancouver. It is expected that the steel will be laid to Yale by the end of the year.

There have been considerable negotiations between the company's officials and the Vancouver city council as to the location of terminals there. At a meeting of the city council, Aug. 29, a letter was read from A. D. Davidson, Land Commissioner, in which the city was asked to transfer in fee simple the balance of the False creek flats and the lots in connection with which a bylaw was passed, for \$600,000; the company to reimburse the city for the amount spent in connection with the site, this not to exceed \$600,000; also to fill in the flats; build a seawall on the west side of Main street bridge; waive to the city a strip of land 1,600 ft. from north to south, and 150 ft. from east to west, east of Main street bridge; give the city three streets 100 ft. each in width through the property; spend a minimum of \$4,000,000 on the property; erect a union station at a cost of \$1,500,000; begin work within 90 days of consent and complete it within five years; grant permission to other railways to use the station on a 5% car basis; build a double track tunnel about four miles long under the city, at a cost of about \$1,000,000 a mile, the same to be operated by electricity; use electricity for operating the yards, and give a suburban service between Vancouver, New Westminster and Port Mann. The proposed agreement has been discussed at length, and several alterations made, and it was reported, Sept. 17, that terms have been all but definitely settled. Vancouver is to be the passenger terminal of the line, with local freight yards, the available room in the False creek bed being 120 acres, and Port Mann will be the freight terminal. Vancouver is to be the location of private industries, while the repair shops, roundhouses, etc., will be at Port Mann. The Vancouver city terminal is to be reached by a tunnel. The estimated cost of the various works in Vancouver is put at \$10,000,000, and it is said it is to be completed in three years, instead of five, as originally proposed.

Vancouver Island Lines.—We are officially advised that a contract has been let to the Northern Construction Co. for the building of a 40 mile section of the line on Vancouver Island, starting about five miles east of Cowichan lake, mileage 100, and extending to about two miles south of Port Alberni, mileage 140. The route crosses the divide west of Cowichan lake, and descends to Nitinat river, crossing that river about three miles north of Nitinat Lake. It then runs up the Little Nitinat river, and along the Francis and Darlington lakes, then down Coleman Creek to about three miles from the Alberni canal, from which it swings easterly and descends on a maximum gradient of 1.5% to the canal, which is followed past Franklin and China creeks to mileage 140, about two miles south of Port Alberni. The character of the country is generally very rough and expensive for railway construction. The maximum gradient is 1.5%, and the maximum curvature 12 degrees. There will be no bridges of importance, except those at the crossings of the Nitinat river, Franklin and China creeks, not yet decided upon. S. O. Lewis, Victoria, B.C., is District Engineer.

The location surveys for the extension of the line from near Alberni, across the

summit to the Campbell river district, have, we are officially advised, been completed. The route is subject to alteration on revision. Engineering parties are in the field looking for a satisfactory route to the upper end of Vancouver island.

Canadian North Eastern Ry.—J. F. Ross and H. Hornberg, recently arrived in Stewart, B.C., and are engaged in making a topographical survey of the country from the present end of steel of the C.N.E. Ry. through the Groundhog coal district to Redcliff and the Dominion Government telegraph line, with a view of deciding upon a route for the extension of the line.

Railway Rolling Stock Notes.

The International Ry. of New Brunswick has ordered 20 logging cars from the Canadian Car and Foundry Co.

The G.T.R. has ordered 2,000 box cars from the Pressed Steel Car Co., and 50 tank cars from the American Car and Foundry Co., for use on the Grand Trunk Western Ry., west of the St. Clair and Detroit rivers.

The G.T. Pacific Ry. has received seven ballast cars, nos. 392993 to 392999, from the Canadian Car and Foundry Co., Montreal; and two flat cars, nos. 361898 to 361899, from the American Car and Foundry Co., thus completing both orders for ballast cars and flat cars, respectively.

The G.T.R. has ordered 25 superheater mikado freight locomotives from the American Locomotive Co., to be built at Schenectady, N.Y. These will be of the 2-8-2 S. type, with cylinders 27 ins. diam. by 30 ins. stroke; driving wheels 63 ins. diam., and total weight in working order, 276,000 lbs.

The Intercolonial Ry. has ordered four switching and five consolidation locomotives from the Canadian Locomotive Co., and five consolidated locomotives from the Montreal Locomotive Works; and has received 20 flat cars from the Nova Scotia Car Works, Halifax, N.S., and two box cars from the Rathbun Co.

It is reported that the Montreal Harbor Commissioners will shortly place orders for 12 electric motors and a large quantity of rolling stock for the harbor railway system, which, it is said, is to be electrified. We are officially advised that no such orders have been placed, nor is it likely they will be placed in the immediate future; also that though electrification may take place, nothing is, at present, in contemplation.

The Central Ontario Ry. has received 25 ore cars; the Canadian Northern Ontario Ry., 50 coal cars; the Halifax and South Western Ry., 6 excursion cars; the Niagara, St. Catharines and Toronto Ry., 10 coal cars; the Canadian Northern Quebec Ry., 50 coal cars, 50 flat cars and 6 excursion cars, and the Brockville, Westport and North Western Ry., 2 first class cars and 1 combination car, from J. T. Gardner, Chicago, Ill.

The Canadian Northern Ry., between Aug. 15 and Sept. 15, ordered the following rolling stock:—5 first class cars, from the Canadian Car and Foundry Co., Montreal; 25 consolidation locomotives, and 20 switching locomotives, from the Canadian Locomotive Co., Kingston, Ont.; 25 cabooses, from its Winnipeg shops; 2 mogul locomotives, from J. T. Gardner, Chicago, Ill.; and 10 tank cars and two 60 ton wrecking cranes in the U.S.

The G.T.R. has made the following additions to rolling stock:—three baggage cars, from its Montreal shops, making 13 out of 20 ordered Mar. 31, 1911; 45 refrigerator cars, and 124 box cars, from the Canadian

Car and Foundry Co.; 93 automobile cars, completing order for 250, Jan. 23, and 50 tank cars, from the American Car and Foundry Co.; 341 box cars, from the Western Steel Car and Foundry Co.; and 512 steel coal cars, from the Pressed Steel Car Co.

E. J. Chamberlin, President, G.T.R. and G.T.P.R., while in Vancouver, recently, is reported to have stated that it had been definitely decided to use oil fuel on the locomotives on the Mountain section, not only because it was safer, but because it was cheaper, the company being in possession of large areas of oil lands, which would give it a perpetual supply. We are officially advised that though no arrangements have been made for using oil on the Mountain division, the matter is under consideration.

The C.P.R., between Aug. 15 and Sept. 15, received the following additions to rolling stock:—18 freight refrigerator cars, 64 vans, 627 wooden box cars, 209 steel frame box cars, 1 pile driver, 2 ballast spreaders, 8 locomotives, class P.1, 1 colonist car, 6 baggage and express cars, 4 mail and express cars, 1 box baggage car, 1 baggage and smoking car, from its Angus shops, Montreal; 339 steel frame box cars, 250 ballast cars, from the Canadian Car and Foundry Co.; 15 locomotives, class D.10, from the Montreal Locomotive Works; 12 stone cars, from the Nova Scotia Car Works; and 48 steel frame box cars from the U.S.

The Canadian Northern Ry., between Aug. 15 and Sept. 15, received the following additions to rolling stock:—154 box cars, 1 first class car, 1 second class car, 1 dining car and 5 baggage cars, from the Canadian Car and Foundry Co.; 2 passenger and mail cars, and 1 combination car, from the Preston Car and Coach Co.; 2 cafe-parlor cars, from J. T. Gardner, Chicago, Ill.; 65 box cars and 4 baggage and mail cars, from the Crossen Car Co.; 57 box cars, from the Nova Scotia Car Works; 2 consolidation locomotives from the Canada Foundry Co.; 8 consolidation locomotives from the Canadian Locomotive Co.; and 60 flat cars from the Rathbun Co.

The two dining cars, which the C.P.R. is building at its Angus shops, Montreal, will be of an entirely new floor plan. The dining room will be 38 ft. 4 ins. long, and will contain 6 tables with a seating capacity of 24, and 6 tables with seating capacity of 12. The larger tables will be 4 ft. wide and the space over the seats will be 6 ft. 4 ins., except the two end tables, where it will be 6½ ft. in each case. The smaller tables will be 2 ft. 9 ins. wide, and the aisle 2 ft. 2 ins. wide. The lighting will be by three 5-cluster lights down the centre, and 12 single globes down each side. The kitchen and pantry, etc., will occupy 33 ft. 9 ins., the refrigerator being at the rear, and arranged to be filled from the roof.

The C.P.R., between Aug. 15 and Sept. 15, ordered the following rolling stock:—1 stores supply car, 25 vans, 5 push snow ploughs, 13 flangers, 2 dining cars, 8 buffet-parlor cars, 2 compartment sleeping cars, 12 observation cars, 10 second class cars, 4 first class smoking cars, 4 first class and smoking cars, 62 suburban cars, 7 mail and express cars, 50 box baggage cars, 14 first class cars, 40 baggage and express cars, 22 tourist cars, 14 sleeping cars, 1,000 steel frame box cars, 2,000 wooden box cars, 2 locomotives, class E.2, 30 locomotives, class U.3, 5 locomotives, class D.4, from its Angus shops, Montreal; 1 steel snow plough, 5,900 steel frame box cars and 100 automobile cars, from the Canadian Car and Foundry Co.; 25 locomotives, class D.10, from the Canadian Locomotive Co.; 500 steel frame box cars, from the Nova Scotia Car Works;

and 1,500 steel frame box cars, from the National Steel Car Co.

Following are chief details of the five consolidation superheater locomotives which the Intercolonial Ry. has ordered from the Montreal Locomotive Works:—

Cylinders, diar. and stroke	22 by 28 ins.
Driving wheels, diar.	56 ins.
Wheel base, rigid	15 ft. 10 ins.
Wheel base, engine, total	24 ft. 4½ ins.
Wheel base, engine and tender, total	56 ft. 6½ ins.
Weight of engine in working order	200,000 lbs.
Weight on driving wheels	175,000 lbs.
Weight of tender	150,000 lbs.
Boiler, type	Extended wagon top
Boiler, outside diar. front end	70½ ins.
Boiler pressure	200 lbs.
Tubes, no. and diar.	242—2 ins.
Flues, no. and diar.	24—5 ins.
Tubes, length	14 ft. 2½ ins.
Superheater, type	Schmidt
Tank capacity, water	6,500 imp. gals.
Tank capacity, coal	12 tons
Maximum tractive power	41,100 lbs.

The 25 consolidation locomotives which the Canadian Northern Ry. is having built by the Canada Foundry Co., Toronto, as announced in our last issue, will be of the same general type as those previously built by the same company, of which we have already given details in previous issues. Following are the main details:—

Cylinders, diar. and stroke	24 by 32 ins.
Driving wheels, diar.	63 ins.
Boiler pressure	180 lbs.
Tractive effort, maximum	45,000 lbs.
Firebox, length and width	110 by 64 ins.
Grate area	49 sq. ft.
Tubes, no. and diar.	272—2 ins.
Flues, no. and diar.	30—5 ins.
Boiler, diar.	72 and 79 ins.
Heating surface, total	2,811 sq. ft.
Weight on drivers	206,000 lbs.
Weight of engine, total	236,000 lbs.
Height, top of rail to top of stack	15 ft. 3 ins.
Driving wheel base	16 ft. 6 ins.
Tender, type	Eight wheel
Capacity, water	6,000 imp. gals.
Capacity, coal	10 tons

Following are chief details of the 4 six consolidation freight locomotives which the Intercolonial Ry. is having built by the Canadian Locomotive Co.:—

Weight in working order on drivers	175,000 lbs.
Weight in working order, total	200,000 lbs.
Wheel base of engine, rigid	15 ft. 10 ins.
Wheel base of engine, total	24 ft. 4½ ins.
Heating surface, firebox	161 sq. ft.
Heating surface, tubes	2,122 sq. ft.
Heating surface, total	2,283 sq. ft.
Driving wheels, diar.	56 ins.
Driving wheel centres	Cast steel
Driving journals	9½ and 9 by 12 ins.
Cylinders, diar. and stroke	22 by 28 ins.
Boiler, type	Radial stayed
Boiler pressure	200 lbs.
Tubes, no. and diar.	206—2 ins.; 28—5½ ins.
Tubes, length	14 ft. 2 ins.
Brakes	Westinghouse, American
Superheater	Schmidt type A
Weight of tender, loaded	150,000 lbs.
Capacity, water	6,500 imp. gals.
Capacity, coal	12 tons
Tank, type	Water bottom
Truck, type	Outside equalized
Wheels, diar.	34 ins.
Wheel, type	Wrought iron, steel tired
Journals	5½ by 19 ins.
Brake beams	Simplex high speed

Following are chief details of the 25 consolidation superheater locomotives which the Canadian Northern Ry. is having built by the Canadian Locomotive Co.:—

Weight on drivers	163,000 lbs.
Weight of engine, total	188,000 lbs.
Wheel base, rigid	15 ft. 6 ins.
Wheel base of engine, total	23 ft. 9 ins.
Heating surface, firebox	179 sq. ft.
Heating surface, tubes	1,772 sq. ft.
Heating surface, total	1,921 sq. ft.
Driving wheels, diar.	57 ins.
Driving wheel centres	Cast steel
Driving journals	9½ and 9 by 12 ins.
Cylinders, diar. and stroke	23 by 26 ins.
Boiler, type	Radial stayed
Boiler pressure	170 lbs.
Tubes, no. and diar.	179—2 ins.; 24—5½ ins.
Tubes, length	14 ft.
Injectors	Ohio
Brakes	Westinghouse, American
Superheater	Schmidt type A
Weight of tender, loaded	144,000 lbs.
Capacity, water	6,000 imp. gals.
Capacity, coal	12 tons
Tank, type	Water bottom
Truck, type	Four wheel equalized
Wheels, diar. and type	33 ins. steel tired

Journals 5½ by 10 ins.
Brake beams Simplex

Following are chief details of the 20 six wheel switching locomotives which the Canadian Northern Ry. is having built by the Canadian Locomotive Co.:—

Weight, total	123,000 lbs.
Wheel base of engine	11 ft.
Wheel base, engine and tender	39 ft. 1 in.
Heating surface, firebox	131 sq. ft.
Heating surface, tubes	1,206 sq. ft.
Heating surface, total	1,337 sq. ft.
Driving wheels, diar.	50 ins.
Driving wheel centres	Cast iron
Driving journals	8½ by 10 ins.
Cylinders, diar. and stroke	19 by 26 ins.
Boiler, type	Radial stayed
Boiler pressure	180 lbs.
Tubes, no. and diar.	223—2 ins.
Tubes, length	10 ft. 5 ins.
Brakes	Westinghouse, American
Weight of tender, loaded	86,000 lbs.
Capacity, water	3,500 imp. gals.
Capacity, coal	5 tons
Tank, type	Sloping back
Truck, type	Arch bar with steel bolsters
Wheels, diar.	33 ins.
Wheels, type	Wrought iron, steel tired
Journals	4½ by 8 ins.
Brake beams	Steel trussed

Following are chief details of the six coupled switching locomotives which the Intercolonial Ry. is having built by the Canadian Locomotive Co.:—

Weight, total	138,000 lbs.
Wheel base of engine	12 ft.
Wheel base, engine and tender	40 ft. 5½ ins.
Heating surface, firebox	132 sq. ft.
Heating surface, tubes	1,935 sq. ft.
Heating surface, total	2,067 sq. ft.
Grate area	27.5 sq. ft.
Driving wheels, diar.	51 ins.
Driving wheel centres	Cast iron
Driving journals	8½ by 11 ins.
Cylinders, diar. and stroke	20 by 26 ins.
Boiler, type	Straight top, radial stayed
Boiler pressure	200 lbs.
Tubes, no. and diar.	300—2 ins.
Tubes, length	12 ft. 6 ins.
Brakes	Westinghouse, American
Length over all, engine and tender	55 ft. 4 ins.
Width over all	10 ft.
Height over all	15 ft. 3 ins.
Weight of tender, loaded	90,000 lbs.
Capacity, water	3,800 imp. gals.
Capacity, coal	6 tons
Tank, type	Hopper with sloping back
Truck, type	Four wheel
Wheels, diar.	33 ins.
Wheels, type	Wrought iron, steel tired
Journals	M.C.B. 4½ by 8 ins.

Following are chief details of the 25 ten wheel locomotives, class D.10G., which the C.P.R. is having built by the Canadian Locomotive Co.:—

Weight on drivers	141,000 lbs.
Weight, total	190,000 lbs.
Wheel base of engine, rigid	14 ft. 10 ins.
Wheel base of engine, total	26 ft. 1 in.
Wheel base, engine and tender	54 ft. 10½ ins.
Heating surface, firebox	180 sq. ft.
Heating surface, tubes	2,238 sq. ft.
Heating surface, total	2,418 sq. ft.
Driving wheels, diar.	63 ins.
Driving wheel centres	Cast steel
Driving journals	9½ and 9 by 12 ins.
Cylinders, diar. and stroke	21 by 28 ins.
Boiler, type	Extended wagon top
Boiler pressure	200 lbs.
Tubes, no. and diar.	240—2 ins.; 24—5 ins.
Tubes, length	14 ft. 4 ins.
Brakes	Westinghouse, E.T.
Superheater	Vaughan and Horsey
Grate area	49 sq. ft.
Superheater heating surface	408 sq. ft.
Width over all, engine and tender	10 ft.
Height over all	15 ft. 2 ins.
Length over all	65 ft. 9 ins.
Weight of tender, loaded	134,000 lbs.
Capacity, water	5,000 imp. gals.
Capacity, coal	12 tons
Tank, type	Water bottom
Truck, type	Outside equalized
Wheels, diar.	36½ ins.
Wheel, type	Cast steel centre with retaining rings
Brake beams	Simplex

Following are chief details of the four Pacific type locomotives, which the Canadian Northern Ry. is having built by the Montreal Locomotive Works, as mentioned in our last issue:—

Weight on drivers	136,000 lbs.
Weight of engine, total	213,000 lbs.
Weight of tender	145,000 lbs.
Wheel base, driving	13 ft.
Wheel base, total engine	33 ft. 7 ins.
Wheel base, total engine and tender	68 ft. 5 ins.

Tractive power, maximum	31,100 lbs.
Factor of adhesion	4.37
Cylinders, diar. and stroke	23 by 28 ins.
Valve gear	Walschaert
Valves, diar.	14 ins.
Driving wheels, diar.	69 ins.
Driving journals	9½ and 9 by 12 ins.
Engine truck, type	Four wheel with swing centre
Engine truck journals	5½ by 12 ins.
Engine truck wheels, diar.	33 ins.
Trailing truck, type	Four wheel radial
Trailing truck journals	8 by 14 ins.
Trailing truck wheels	45 ins.
Boiler, type	Extended wagon top, radial stay.
Boiler, outside diar. front end	62 ins.
Boiler, outside largest course	70 ins.
Boiler pressure	170 lbs.
Firebox, length and width	108½ by 64½ ins.
Tubes, no. and diar.	162—2 ins.
Tubes, length	20 ft.
Flues, no. and diar.	24—5 ins.
Heating surface, tubes	2,358 sq. ft.
Heating surface, firebox	160 sq. ft.
Heating surface, total	2,518 sq. ft.
Grate area	48.2 sq. ft.
Tender wheels, diar.	33 ins.
Tender journals	5½ by 10 ins.
Tender truck, type	Four wheel pedestal
Tank, type	Water bottom
Capacity, water	6,000 imp. gals.
Capacity, coal	12 tons.

Minneapolis, St. Paul and Sault Ste. Marie Railway.

The report for the year ended June 30, states that the extension from Frederic to Duluth was completed during the year and traffic is now being handled between the twin cities and Duluth. The line in North Dakota between Drake and Fordville, 130 miles, the construction of which was commenced in 1910 and temporarily discontinued on account of crop failures, was expected to be ready for traffic by Oct. 1. In connection with the new terminals at Chicago, land has been acquired, one block wide on the west side of the Chicago river between Canal and Clinton streets, and extending from 12th street to West 15th place. Contracts have been let for the construction of concrete freight houses. The property is made available by a contract with the Baltimore and Ohio Chicago Terminal Rd., for the use of that company's tracks to a connection with the M.St.P. & S.S.M.R. Chicago division. A strip of land one block wide, from Canal to Halstead streets, has been acquired for a connection between the two forementioned tracks, and considerable land has also been acquired at 50th street for yards, etc. The finance report shows gross earnings (including the Chicago division, formerly Wisconsin Central Ry.), \$26,684,240.93; expenses, \$16,223,291.02; net earnings, \$10,460,949.91; income from other sources, \$1,099,019.53; total income, \$11,559,969.44, less fixed charges, taxes, etc., \$6,831,030.02; surplus income, \$4,728,939.42. The average mileage operated was 3,773.37, an increase of 49.03 miles. In connection with the provision of terminals at Chicago, the company and the Central Terminal Ry. Co. have executed a joint mortgage covering the property and its improvements, providing for a possible issue of \$20,000,000 4% gold bonds, of which \$6,000,000 have been sold, the proceeds being sufficient to complete the terminals as now planned. To provide funds for the building of the Frederic extension to Duluth, Minn., temporary advances for which had been made from the company's surplus account, \$1,520,000 of M.St.P. & S.S.M.R. first mortgage consolidated gold bonds have been issued, and \$1,020,000 of the company's equipment trust notes have also been issued in connection with additional equipment contracted for delivery prior to Sept. 1. To provide for temporary advances made for revision work on the Chicago division, for payment of car trust obligations and retirement of maturing bonds of underlying mortgages of the Wisconsin Central Ry., \$3,500,000 of W.C.R. first and refunding mortgage bonds were issued.

Orders by the Board of Railway Commissioners.

Beginning with June, 1904, Canadian Railway and Marine World has published in each issue summaries of orders passed by the Board of Railway Commissioners, so that subscribers who have filed our paper have a continuous record of the Board's proceedings. No other paper has done this.

The dates given of orders, immediately following the numbers, are those on which the orders took place, and not those on which the orders were issued. In many cases orders are not issued for a considerable time after the dates assigned to them.

17155. July 31.—Authorizing Esquimalt and Nanaimo Ry. to build bridge 5.2 over Burnside road, near Victoria, B.C.

17156. June 24.—Authorizing C.P.R. to build spur for Jamieson Lime Co., Sand Point, Ont.

17157. July 27.—Authorizing Kettle Valley Ry. to build bridge over Okanagan river at Penticton, B.C.

17158. Aug. 1.—Authorizing Canadian Northern Ry. to cross 68 highways with its Goose Lake extension, Alta.

17159. July 31.—Authorizing Campbellford, Lake Ontario and Western Ry. (C.P.R.) to cross five highways between mileage 126.60 and 155.70, Ont.

17160. July 31.—Authorizing G.T.R. to build spur for Dominion Cannery, Ltd., Aylmer, Ont.

17161. Aug. 1.—Authorizing Campbellford, Lake Ontario and Western Ry. (C.P.R.) to cross nine highways between mileage 177.86 and 183.45.

17162. Aug. 1.—Authorizing C.P.R. to build spur for Golden West Brewing Co., Titian, Alta.

17163. Aug. 1.—Authorizing Campbellford, Lake Ontario and Western Ry. (C.P.R.) to cross four highways between mileage 121.87 and 124.83, Ont.

17164, 17165. Aug. 1.—Authorizing C.P.R. to build spur for Stag Creek Lumber Co. on its Maniwaki subdivision, Que., and for Carter Mather Lumber and Supply Co., Calgary, Alta.

17166. Aug. 1.—Approving C.N. Ontario Ry. station site at Torbolton.

17167. Aug. 2.—Authorizing Medonte tp., Ont., to build highway crossing over C.P.R. Sudbury-Kleinburg branch.

17168. Aug. 1.—Approving drain plans for Woodworth award drain under G.T.R. in Malahide tp., Ont.

17169. Aug. 2.—Authorizing C.N. Branch Lines Co. to connect its Canora-Sturgis branch with C.N.R. main line at Canora, Sask.

17170. Aug. 1.—Authorizing C.N. Quebec Ry. to build across public road in St. Augustin parish.

17171. Aug. 7.—Approving Canadian Northern Ry. location through tps. 19-15, r. 29-26, w. 4 m., mileage 31.40 to 65.05, Alta.

17172. Aug. 6.—Authorizing C.N. Ontario Ry. to cross two highways on its Ottawa-Capreol line, in Field tp.

17173. Aug. 3.—Authorizing C.P.R. to build spur to its freight sheds at New Westminster, B.C.

17174, 17175. Aug. 6.—Authorizing Campbellford, Lake Ontario and Western Ry. (C.P.R.) to cross forced road from Crow Lake to Sharbot Lake, Ont., and highway in Hamilton tp., Ont.

17176. Aug. 6.—Authorizing G.T. Pacific Branch Lines Co. to build spur for Pacific Pass Coal Fields, Ltd., North Alberta district.

17177, 17178. Aug. 3.—Authorizing G.T.R. to build siding into W. S. Cook & Son's premises, Belleville, Ont., and for Canadian Northern Montreal Land Co., St. Laurent parish, Quebec.

17179, 17180. Aug. 3.—Approving plans of Dominion Atlantic Ry. for additional wing walls for bridges at Bridgetown, and over Avon river, at Windsor, N.S.

17181. Aug. 6.—Authorizing Kettle Valley Ry. to cross highway northwest of Penticton, B.C.

17182. Aug. 3.—Authorizing Essex Terminal Ry. and Michigan Central Rd. to operate over crossing in Windsor, Ont., and rescinding order 16638, May 29, in same connection.

17183. Aug. 6.—Authorizing G.T. Pacific Branch Lines Co. to cross 12 highways on its Cutknife branch, Sask.

17184. Aug. 7.—Authorizing G.T. Pacific Ry. to carry traffic from mileage 100 to 164, east of Prince Rupert, B.C.

17185. Aug. 13.—Authorizing C.P.R. to build spur for G. F. Stephens & Co., Calgary, Alta.

K. J. Burns, Assistant General Freight Agent, Great Northern Ry., Vancouver, B.C., born at Rochester, Eng., Oct. 11, 1878.

F. F. Busteed, C.E., Engineer in charge of C.P.R. revision and tracking, west of Calgary, Kamloops, B.C., born at Battery Point, Que., Oct. 10, 1858.

C. E. Cartwright, M. Can. Soc. C.E., ex-Division Engineer, C.P.R., Vancouver, B.C., born at Toronto, Ont., Oct. 13, 1864.

G. S. Cooke, Superintendent, Grand Trunk Pacific Ry., Melville, Sask., born at Montreal, Oct. 27, 1875.

L. V. Druce, Commercial Agent, G.T.R. and G.T.P.R., Vancouver, B.C., born at London, Eng., Oct. 20, 1873.

C. E. Dewey, General Freight Agent, Grand Trunk Pacific Ry., Winnipeg, born at Cheshunt, Eng., Oct. 2, 1873.

J. Earls, ex-Secretary and Treasurer, Canadian Freight Association at Toronto, born in Ireland, Oct. 30, 1838.

C. E. Friend, General Auditor, Canadian Northern Ry., Winnipeg, born at Brighton, Eng., Oct. 12, 1871.

W. P. Fitzsimmons, Commissioner of Industries, G.T.R., Montreal, born at Detroit, Mich., Oct. 27, 1868.

A. H. Harris, Special Traffic Representative, C.P.R., Montreal, Que., born in Devonshire, Eng., Oct. 15, 1855.

G. Hodge, General Superintendent, Eastern Division, C.P.R., Montreal, born there Oct. 2, 1874.

J. H. Hughes, Assistant Superintendent, District 2, Eastern Division, Smith Falls, Ont., born at Charlottetown, P.E.I., Oct. 7, 1865.

J. W. N. Johnstone, General Passenger Agent, Reid Newfoundland Co., St. John's, Nfld., born at Campobello, N.B., Oct. 4, 1878.

S. Way Kent, Ticket Agent, C.P.R., Paris, Ont., born in Brant County, Ont., Oct. 23, 1879.

W. M. Kirkpatrick, Assistant Freight Traffic Manager, Eastern Lines, C.P.R., Montreal, born at Kingston, Ont., Oct. 8, 1874.

W. B. Lanigan, Assistant Freight Traffic Manager, Western Lines, C.P.R., Winnipeg, born at Three Rivers, Que., Oct. 12, 1861.

J. W. Leonard, Assistant to Vice-President, C.P.R., Montreal, born at Epsom, Ont., Oct., 1858.

C. F. Lunan, Assistant Commissary Agent, C.P.R., Calgary, Alta., born at Sorel, Que., Oct. 2, 1879.

Sir William Mackenzie, President, Canadian Northern Ry., Toronto, born at Kirkfield, Ont., Oct. 30, 1849.

W. T. Marlow, Import Freight Agent, C.P.R., Montreal, born at Limerick, Ireland, Oct. 25, 1872.

R. Marpoie, General Executive Assistant, C.P.R., Vancouver, B.C., born in Montgomeryshire, Wales, Oct. 9, 1850.

H. Paton, President, Shedden Forwarding Co., Montreal, born at Johnstone, Renfrew, Scotland, Oct. 5, 1852.

D. Pottinger, I.S.O., Assistant Chairman, Government Railways Managing Board, Moncton, N.B., born at Pictou, N.S., Oct. 7, 1843.

H. G. Reid, Master Mechanic, C.P.R., North Bay, Ont., born at Pembroke, Ont., Oct. 27, 1863.

W. S. Rollo, joint agent, G.T.R. and Central Vermont Ry., St. John's, Que., born at Dundee, Scotland, Oct. 8, 1852.

J. K. Savage, Superintendent, District 1, Saskatchewan Division, C.P.R., Regina, born at Forrester, Ill., Oct. 5, 1876.

Sir Thomas G. Shaughnessy, K.C.V.O., President, C.P.R., Montreal, born at Milwaukee, Wis., Oct. 6, 1853.

T. Duff Smith, Fuel Agent, Grand Trunk Pacific Ry., Winnipeg, Man., born at Barking, Essex, Eng., Oct. 2, 1868.

A. B. Spence, Travelling Auditor, Reid Newfoundland Co., St. John's, Nfld., born at Harbor Grace, Nfld., Oct. 21, 1882.

E. Sterling, Superintendent, Districts 2 and 3, British Columbia Electric Ry., New Westminster, born at Thornbury, Ont., Oct. 3, 1875.

W. S. Taylor, ex-Treasurer, C.P.R., Montreal, born at Dornoch, Sutherlandshire, Scotland, Oct. 18, 1839.

E. N. Todd, Division Freight Agent, Eastern Division, C.P.R., Montreal, born at Huntington, Que., Oct. 17, 1879.

A. W. Wheatley, Manager, Canadian Locomotive Co., Ltd., Kingston, Ont., born at Ashford, Kent, Eng., Oct. 12, 1870.

L. H. Wheaton, Resident Engineer, Dartmouth branch, Intercolonial Ry., Dartmouth, N.S., born at Sackville, N.B., Oct. 5, 1866.

G. B. Wyllie, Travelling Passenger Agent, Illinois Central Rd., Buffalo, N.Y., born at Toronto, Ont., Oct. 15, 1855.

Railway Lands Patented.—Letters patent were issued during JJuly, covering railway lands in Manitoba, Saskatchewan, Alberta and British Columbia, as follows:

Canadian Northern Ry.	1,070.88
Canadian Pacific Ry. roadbed and station grants	203.62
Kootenay Central Ry.	4.25
Qu'Appelle, Long Lake and Saskatchewan Rd. and Steamboat Co.	2,736.37
Total	4,015.12

A press report from Calgary, Alta., states that the elevators owned by the Alberta Pacific Elevator Co., the West Coast Grain Co. and the Globe Elevator Co. have been sold to an English syndicate, headed by Sir Max Aitken. The total elevator capacity is given as 3,000,000 bush., the largest elevator included in the transaction being the last mentioned company's terminal at Calgary with a capacity of 400,000 bush.

Electric Railway Department.

Street Railway Construction on Granville Street, Vancouver.

By C. B. Vorce, Construction Engineer, British Columbia Electric Railway.

Granville street, Vancouver, B.C., is a principal business street, over which six car lines or about 150 cars an hour pass. The tracks on this street between Robson and Drake streets, half a mile, were riding so badly that their reconstruction was imperative. It was not advisable to rebuild during operation, and as there is a double track car line only two blocks away, the

Fig. 1.—Longitudinal Section of Track.

Board of Public Works granted the company permission to abandon traffic during construction, providing it was restored in 24 days.

The street was paved with wood blocks laid on 6 ins. of concrete, and each rail of the double track was carried on a concrete girder 2 ft. wide and 15 ins. deep. Owing to the nature of the foundation these

track was then surfaced to grade on a sand cushion averaging 1 in. deep and the concrete was brought up to the under side of the pavement. By referring to the standard cross-section, fig. 2, it will be seen that the bottom of the concrete slab is 20 ins. below the rail grade.

The reconstruction of the tracks called for taking out and replacing the following quantities: 5,100 sq. yds. of wood block paving, 10,200 lin. ft. of rail or 5,100 lin. ft. of single track, 1,800 cu. yds. or 5,100 sq. yds. of concrete, 600 cu. yds. of earth and the laying of 2,400 cu. yds. of concrete, one-half mile of double track, 850 sq. yds. of granite flangeway blocks and 4,250 sq. yds. of wood blocks.

As the concrete had to set 10 days before traffic could be turned back on the street, this necessitated the completion of the work above outline, except the paving, in 12 days, and not 14 days, as two Sundays intervened. The work was carried on day and night, and a schedule, fig. 3, was prepared showing the rate of progress which must be made on each of the operations

tion force, which does the greater portion of its work, so it was certain of the speed with which the various operations, with the exception of breaking up the concrete, could be accomplished.

The company had just built a piece of new track which called for the removal of about 300 sq. yds. of concrete of a similar nature, which had been laid by the same contractors. This piece of concrete was removed by hand and it took 15 men 6 days to do the work. As the schedule called for the removal of about 32 sq. yds. of concrete an hour, it was seen that some mechanical means must be used, and the following scheme was adopted:

The dipper arm was taken off the company's electrically driven automatic shovel and the pile driver leads, about 20 ft. long, were hung from the end of the boom, being held in position by two braces running back to the main frame of the shovel. A hammer weighing 2,600 lbs., with a wedge shaped cutting edge about 8 ins. deep running parallel to the track, was specially cast. The cutting edge was

Fig. 2.—Cross Section of Track and Details of Bond Drilling.

Fig. 3.—Chart Showing Progress of Work on Granville Street.

girders were not heavy enough to carry the weight imposed upon them and on account of this the company adopted the type of construction shown by figs. 1 & 2. This construction consists of a 6 in. concrete slab which is laid over the entire track allowance, 18 1/2 ft. wide, upon which 91 lb. T rails 7 ins. high are laid on 6 x 8 in. by 8 ft. ties spaced 2 ft. centre to centre. The

in order that the work should be completed within the time limit. This schedule was so closely followed that all the work, except the paving, was finished one hour before the time called for by the schedule, and during the 10 days the concrete was setting the street was repaved so that when traffic was restored all the work was completed. The company has a large construc-

placed this way in order not to injure the remaining concrete in the street. This scheme worked excellently and no trouble whatever was found in breaking up the concrete as rapidly as it could be taken away.

The concrete breaker, which could swing through 350°, was placed on one track and on the other track the derrick car was

placed. This derrick car had a 60 ft. boom, which could also swing through 360° and could move itself up and down the track. This car was used to break up the larger pieces of concrete and load them on flat cars placed behind the concrete breaker, also to unload skips in which were placed the smaller pieces of concrete and earth, this material being dumped into wagons standing alongside. The concrete breaker and derrick car backed up on the old track as soon as the concrete was broken up for a rail length ahead of them.

The price of common labor was \$3 a day of 10 hours, and teams received \$8 a day shift of 10 hours and \$9.50 for night shift. The average haul for teams was $\frac{3}{4}$ of a mile and for the track cars about 2 miles. The cost of the work was as follows:

Digging up wood blocks, 8 9-10 cts. per sq. yd.

Tearing up old track, 11 cts. per ft. of single track.

Breaking up concrete, 40 cts. per sq. yd., or \$1.13 per cu. yd.

Excavation, loading and dumping, 82½ cts. per cu. yd.

Removing material by teams and work train, 65 cts. per cu. yd.

G. R. G. Conway, M. Can. Soc. C. E., is Chief Engineer of the B.C.E.R. Co., and the work was carried on under the supervision of C. B. Vorce, M. Am. Soc. C. E., Engineer of Construction, assisted by H. J. Tippet, Engineer Maintenance of Way, and A. J. Kennedy, Roadmaster.—Engineering and Contracting.

Handling Interurban Traffic With Trailer Cars.

As shown in the accompanying illustration of cars on the London and Lake Erie Ry. and Transportation Co.'s line between London and Port Stanley, Ont., the trailer system of handling dense traffic has been introduced this summer. Earlier in the year, two motor cars and two trailers were purchased in the United States, the design of which may be noted in the illustration. These cars are 50 ft. long, with a seating capacity of 58 people each. The motor equipment of each motor car is four 50 h.p. motors, two on each truck.

The cars, both motor and trailer, are rather unusual in body design, as the roof is of the arch type without a clerestory and deck sash along the sides. This makes a lighter construction that is both simpler and very pleasing to the sight. Both ends of the cars are completely enclosed, and have side doors with traps over the steps. The conductors and motormen have instructions to see that both are properly closed before putting the cars in motion when handling crowds, accidents being thereby largely prevented. The motor cars have centre doors at the ends leading out to the vestibules, which are at the same level as the body of the car, it being considered that such a design strengthens the body considerably for the trailer haul, as the centre sill is continuous. In the trailers, the vestibules are integral with the body. This permits of more space being available when the traffic is heavy. Extra precautions have been taken to prevent any injury to passengers from falling between the motor and trailer. It is for this reason principally that the ends of the trailer are enclosed. The end windows have cross bars at a convenient height for resting the elbows.

Another especial feature of the design is the efficient placing of the seats. The walls between the side posts are made particularly thin, and into the recess thus formed, the seats are set. With the windows open and the elbows resting on the sill, the passenger is able to sit up very close, leaving

ample space for the occupant of the inner seat without the latter sitting half out over the aisle as in the usual design of cars. The fact that the seats are set into the space between the side posts gives an additional width to the centre aisle of some six inches, giving a particularly clear passage-way down the centre, which is of particular value when a big crowd is being handled.

No tests have been made as regards efficiency of the motor when operating alone, as compared to the former two-motor cars, but experience elsewhere would seem to demonstrate that it is as economical as the latter. When operating with trailers, these four-motor cars have been able to stand up in the schedule with the two-motor cars, and have given no trouble.

A new feature in the cars is the application of the combination air hose coupler, in which the two air connections to the trailer from the motor are made automatically by the coupler, the air connections being right in the side faces of the couplers, which are of an unusual design.

The cars are intended primarily for summer operation when the traffic from London to Port Stanley, the southern terminus of the line at Lake Erie, is particularly heavy. Provision has been made for their operation in the winter, when required, as they are all equipped with heaters and ventilators.

London and Lake Erie Railway and Transportation Co. Trailer Operation.

Electrification on the New York, New Haven and Hartford Railroad.

The N.Y., N.H. & H. Rd. is to be electrified between Boston, Mass., and Providence, R.I. The work will be done by equipping four tracks with the same single phase catenary system now in use at the New York end of the system. It is further stated that several tracks at the south station in Boston will be equipped for electrical operation, and that legislation permitting the construction of the much discussed tunnel between the New Haven and the Boston and Maine systems will be strongly urged. This very important extension of electric operation on the New Haven road indicates that in all probability there will be through electric service from Boston to New York before many years have passed. There are difficulties in the way of this which have nothing to do with electrification, except indirectly. Grade crossings must be eliminated, for instance, and it is very desirable to have substantial reductions in grade before electrification is inaugurated. Such work has already been done on the section from Boston to Providence, and consequently it is expected that the electrification of that line can be completed during 1913, including a large generating station at Providence and another at Readville, Mass. From Providence to New Haven the present conditions are not so favorable for electric operation, however, and it is likely that before the steam operation of passenger

trains is abandoned there electric operation on the two ends of the road will be pretty well standardized.

Automatic Signalling and Train Dispatching in Indiana.

After a thorough examination of the Simmen system of railway signalling and train dispatching as operated for the last three months on 18 miles of the Indianapolis and Cincinnati Traction Co.'s lines, official approval has been granted by the Railroad Commission of Indiana for its continued use. The traction company is ordered to install and have the same system in operation by Dec. 31, on its Indianapolis-Greensburg division from the junction at Indianapolis to Greensburg. In connection with this order, the Commission recommends to the traction company that any further improvements and developments of the Simmen system, which are to be made under the direction of the Commission and its block signal inspector, should have special reference to such arrangements of the apparatus that it will be impossible for trains in one direction to receive signals intended for trains running in the other.

In view of the Commission's approval the traction company has advised the manufacturer of this system, Northey-Plummer.

Ltd., Toronto and Indianapolis, that it has decided to have all of its lines equipped at once with the system. For the present, until its lines are extended, one dispatcher will operate the entire system, although later it may be found necessary to have the services of two dispatchers. It is the company's intention to have its entire system, comprising 107 miles, equipped by Dec. 31.

Trackless Trolleys for Shunting.—An interesting application of trackless trolleys is being made at Altona, Germany, for the shunting of freight cars. The fireless locomotives in use since 1909 are being replaced by trackless tractors operated by means of trolleys pressed by a rigid rod against a double pole overhead line. The trolley, arranged on the roof of the tractor, is designed for deviating on either side to a maximum distance of 11½ ft., so as to allow the tractor to travel on either track. A single overhead line thus suffices for the shunting service, and the loading of cars is not interfered with. The tractor, which weighs 6 tons, has been designed for handling up to 6 cars with their full load at a speed of 1.86 to 3.73 miles, and is worked by a 25 h.p. continuous current motor at 550 volts, driving all four wheels through a 10:1 worm gear. The coupling device is operated from the driver's stand, so that the brakeman need not pass between the buffers. The shunting line is $\frac{3}{4}$ mile long, and reaches as far as the boundary of Hamburg.

Non-Magnetic Calipers at the London Street Railway Shops.

Machinists employed on the repair of motor parts are all familiar with the trouble usually experienced from the tools employed becoming magnetized and their sensitiveness thereby greatly decreased, unless extra precautions are taken to counteract any of the bad effects resulting. This is especially true of calipers. When turning down say a motor axle, the calipers may feel as if they are gauging correctly over the sides of the axle, when in reality, the calipers are set larger than the diameter of the shaft just calipered and considered correct. This deception arises from the fact that the axle, being strongly magnetized, draws one or other of the caliper points towards it, with the other point free from the side of the axle entirely. Yet at the same time, the calipers will feel as if they are correctly set over the axle, as when they are drawn across, the touching point drags so heavily, from the fact that it is magnetized, that the operator is deceived into believing they are correctly set, when,

Non-Magnetic Calipers, fitted with Brass Points.

as a matter of fact, they are only approximating the diameter by as much perhaps as $\frac{1}{8}$ in. Any error above that would no doubt be detected by the eye.

The calipers shown in the accompanying illustration were made by H. Hussey, machinist in the London (Ont.) St. Ry. shops, to overcome the difficulties just outlined. The upper ends are made $\frac{1}{2}$ in. square, with the upper ends locked $\frac{1}{4}$ in. lock nut. Looping over the top from leg to leg, there is a spring to keep the legs normally apart. Adjustment is obtained from an adjusting screw, carrying a coil spring between the leg pins. In the lower ends of the legs there are inserted flattened pieces of brass wire, secured by set screws. These brass wires are bent to the shape of caliper ends, with the points rounded. With such an arrangement, no trouble at all is experienced from magnetization, brass being a non-magnetic metal.

The Regina Municipal Ry. on Saturday, Aug. 31, carried 10,800 passengers, the largest number carried on any ordinary day since the line was opened.

Electric Railway Finance, Meetings, Etc.

British Columbia Electric Ry.—Gross earnings for July, \$538,840; operating expenses, \$333,045; net operating earnings, \$205,795; renewal funds, \$51,502; net earnings, \$154,293; approximate income from investments, \$35,000; net income, \$189,293, against \$409,330 gross earnings; \$258,265 operating expenses; \$151,065 net operating earnings; \$38,012 renewal funds; \$113,053 net earnings; \$25,000 approximate income from investments; \$138,053 net income for July, 1911.

Calgary Municipal Ry.—Passenger earnings for Aug., \$56,813.90; miscellaneous earnings, \$817.85; total earnings, \$57,631.75; operating expenses, \$33,349.46; balance, \$24,282.29; contingent account and interest and sinking fund, \$8,144.91; net profits, \$16,137.38, against \$35,513.55 passenger earnings; \$425.80 miscellaneous earnings; \$35,939.35 total earnings; \$18,232.29 operating expenses; \$17,707.06 balance; \$7,060.30 contingent account and interest and sinking fund; \$10,646.76 net profit, for Aug., 1911.

Cape Breton Electric Co.—Gross earnings for July, \$33,115.85; operating expenses and taxes, \$16,973.96; net earnings, \$16,141.89; interest charges, \$4,495.83; balance, \$11,646.06; sinking and improvement funds,

ended July 31, \$4,725,174; net earnings, \$2,418,921, against \$4,198,956 aggregate gross earnings; \$2,139,145 net earnings, for same period 1911.

Winnipeg Electric Ry.—Gross earnings for July, \$315,362; operating expenses, \$163,930; net earnings, \$151,432, against \$322,751 gross earnings; \$152,108 operating expenses; \$170,643 net earnings, for July, 1911. Aggregate gross earnings for seven months ended July 31, \$2,124,066; net earnings, \$992,562, against \$2,204,357 aggregate gross earnings; \$1,096,193 net earnings for same period 1911.

Personal Paragraphs.

B. L. JONES, who has been General Manager and Treasurer of the Niagara Gorge Rd., Niagara Falls, N.Y., and the Lewiston and Youngstown Frontier Ry., has been appointed Vice-President and General Manager of both companies.

V. E. HAVENS, heretofore General Superintendent, Oswego Division, Syracuse, Lake Shore and Northern Rd., has been appointed Acting General Manager, Buffalo, Lockport and Rochester Ry., with office at Rochester, N.Y.

E. S. FASSETT has resigned the General Managership of the United Traction Co. of Albany, N.Y., to go into business.

Calgary Municipal Railway Scenic Car.

\$1,206.67; balance for reserves, etc., \$10,439.39, against \$31,215.49 gross earnings; \$16,384.68 operating expenses and taxes; \$14,830.81 net earnings; \$4,512.50 interest charges; \$10,318.31 balance; \$1,140 sinking and improvement funds; \$9,178.31 balance for reserves, etc., for July, 1911. Construction charges for month, \$3,468.29.

Halifax Electric Tramways Co.—Press reports from Halifax, N.S., state that the majority stock of this company has been acquired by E. A. Robert, President Montreal Tramways Co., and associates, and that the other shareholders will be offered 160 for their stock. Railway traffic receipts for Aug., \$26,140.26, against \$25,594.16 for Aug., 1911.

London St. Ry.—Gross earnings for July, \$28,205.35; expenses, \$18,711.63; net earnings, \$9,493.72; deductions, \$2,450; net income, \$7,043.72; for August, gross earnings, \$27,551.52; expenses, \$18,071.52; net earnings, \$9,480; deductions, \$2,450; net income, \$7,030. Aggregate gross earnings for eight months ended Aug. 31, \$197,565.29; expenses, \$138,285.20; net earnings, \$59,280.09; deductions, \$19,268.50; net income, \$40,011.59.

Toronto Ry., Toronto and York Radial Ry., and allied companies.—Gross earnings for July, \$712,456; operating expenses, maintenance, etc., \$329,607; net earnings, \$382,849, against \$630,663 gross earnings; \$296,723 operating expenses, maintenance, etc.; \$333,940 net earnings, for July, 1911. Aggregate gross earnings for seven months

The Calgary Municipal Ry. Scenic Car, an illustration of which appears on this page, and which was adopted on the recommendation of T. H. McCauley, Superintendent, has proved more profitable than was anticipated. One hour trips are run over different routes for six or eight hours, on fine days, and the car is accompanied by a conductor who describes the points of interest to the passengers. A charge of 25 cents a passenger is made for the trip. The car, which cost \$7,500, was built by the Preston Car and Coach Co.

The Regina city council is reported to be considering the purchase of an additional eight cars.

The joint board operating the Port Arthur and Fort William Electric Ry. has reported to the Port Arthur city council on the necessity of purchasing six or seven more cars, and a snow plough. The council referred the matter to the Commissioner of Public Utilities.

The Quebec Public Utilities Commission announced Sept. 10, that by November there will be only 454 single truck cars in operation in Montreal, as the Montreal Tramways Co. is complying with the Commission's order not to build any more, and to retire those in service at the rate of 50 a year. The Commission is also enforcing an order that all cars over 30 ft. long, and weighing more than 25,000 lbs., shall be fitted with air brakes, and that all cars operating on severe gradients shall be equipped with an emergency brake.

Electric Railway Projects, Construction, Betterments, Etc.

Bassano Electric Power and Development Co.—We are advised that the proposition for the building of a electric railway from Bassano, Alta., is probably "past history." It is expected that the franchise granted to Mr. Whiting has been lost, and that nobody else would care to take up "such a proposition as running an electric car from Bassano to the C.P.R. dam, unless it be the C.P.R." At any rate there is no vitality in the proposition at present. (June, pg. 308.)

Battleford, Sask.—A proposition was submitted to the city council of Battleford, Sask., Sept. 2, by — Fitzgerald, on behalf of a British syndicate, for the building of an electric railway in the city. The matter is under consideration.

Berlin and Northern Ry.—A bylaw authorizing the expenditure of \$6,000 towards the cost of a county bridge across the Grand river at Bloomingdale, Ont., in connection with the extension of the old Berlin and Bridgeport Electric Ry., was passed by the Berlin town council, Aug. 31. (Aug., pg. 421.)

Brandon, Man.—Track laying is being proceeded with on the municipal electric railway lines being built in the city. The first section of line to be laid is on Princess ave. and First st. easterly to Frederick st., at which point a connection is being made with the track previously laid on Rosser ave. (Aug., pg. 421.)

The British Columbia Electric Ry. moved its headquarters staff to its new office block at Hastings and Carrall streets, Sept. 3.

A cable has been received from the directors in London, Eng., to the effect that the very best terms upon which the company is prepared to negotiate for a consolidation of franchises in Greater Vancouver, has already been submitted, and that they are unable to consider any arrangement which would modify those terms.

Press reports state that construction is to be started at once on the extension of the Fraser st. line in South Vancouver to River road, and that plans for an extension from Clayburn to Mission City are under consideration.

The British Columbia Minister of Railways has approved of general location plans for a line from Port Moody northeasterly to the Vancouver Power Co.'s Coquitlam dam.

The Puget Sound Bridge and Dredging Co., Seattle, Wash., has closed a contract with the B.C.E.R. Co. for the construction of a large dam on Jordan river. The dam will form a part of the Jordan river hydro-electric system, which the B.C.E.R. Co. is developing to secure an output of 36,000 h.p. The dam will be 800 ft. long and 115 ft. high. It will be of the Ambursen type of construction, this form having been selected by G. R. G. Conway, Chief Engineer of the B.C.E.R. Co. in preference to a solid concrete construction. The contract calls for an expenditure of approximately \$500,000. Preliminary operations have been started and it is expected the work will be completed in eight months.

The Board of Railway Commissioners has authorized the opening for traffic of the second track from 24th Ave., Point Grey to Eburne, 4.5 miles.

The Board of Railway Commissioners has authorized the Vancouver and Lulu Island Ry., which is operated under lease from the C.P.R., by the B.C.E. Ry., to lay its second track across 22 streets and avenues in Vancouver. (Sept., pg. 468.)

Burrard, Westminster, Boundary Ry. and Navigation Co.—W. McNeill, chairman of the board, is reported as having stated,

Sept. 12, as follows:—That construction of the projected electric line between Slave river and Pitt river, B.C., will be started next year; that the further surveys necessary to carry the line from Pitt river into Vancouver are to be started at once; that he had been in consultation with the Provincial Minister of Railways in reference to the building of a single track across the Pitt river, with turnouts at each end, and a draw span to permit of navigation; that the substructure would be built so as to permit of the widening of the bridge to carry a second track, as well as to provide for ordinary traffic; that the bridge work will be started in the spring, and will be completed in a year thereafter; that it is expected to complete the line early in 1915, and that it will be operated by electricity supplied by the Western Canada Power Co., which holds the charter. (May, pg. 251.)

The Dunnville, Wellandport and Beamsville Electric Ry. Co. has a charter to build a line from Port Dover, across the Niagara peninsula to St. Catharines, Ont. The route surveyed shows a line from Port Dover to Dunnville, where connection will be made with the G.T.R.; thence to Moulton, connecting with the Michigan Central Rd., and Wabash Rd.; thence to St. Anns, connecting with the C.P.R. and Toronto, Hamilton and Buffalo Ry., thence to Beamsville and St. Catharines. The company has also power to build branch lines to Welland, 12 miles; to Jordan harbor, 3 miles, and to Port Maitland, 4 miles. The entire country through which the line runs is very level, with the exception of the Niagara hill at Beamsville, where the maximum gradient is 3%, and the country from Jordan to St. Catharines is rather more difficult. The average gradient throughout the line is $\frac{1}{2}\%$. The main line has been located on a private right of way practically for the whole distance, and the right of way, from Dunnville to St. Anns, with the exception of two or three parcels, has been acquired. This section of the line will be 16 miles long, and the municipalities have voted \$20,000 towards its construction. Construction is said to be well advanced, and it is expected to have the 16 miles completed and in operation by the end of the year. The construction is equal to that of steam roads, and the bridges are built to carry the largest freight cars weighing, when loaded, 148,000 lbs. It is intended to operate gas-electric motor cars over the line.

The company has a capital of \$400,000, and is empowered to issue bonds to the amount of \$20,000 a mile for the whole line, with an additional \$10,000 a mile for the section from Jordan to St. Catharines. An issue of 5% bonds in denominations of \$100, \$500 and \$1,000, with a bonus of an equal amount of common stock, is now being made.

The officers and directors are:—President and General Manager, J. A. Ross, Wellandport, Ont.; Vice President, A. McLaren, St. Catharines, Ont.; other directors:—C. W. Barwell, Port Dover, Ont.; J. W. Holmes, Selkirk, Ont.; W. Young, Ottawa; Secretary, M. R. Campbell, Wellandport, Ont.; Solicitors, J. R. Roaf, Toronto, and Bradford and Bradford, Dunnville, Ont. (Sept., pg. 468.)

Hamilton, Ont.—A proposition has been submitted to the city council by A. M. Snyder for the building of an electric railway from King and Catharine streets to the mountain top, to be operated by hydro-electric power. The line can only be built if the Hamilton Street Ry. fails to build such a line if called upon to do so by the city council. (Sept., pg. 468.)

Hamilton Street Ry.—Application is being made to the Hamilton, Ont., city council for power to extend the line along King st. west, to a new industrial suburb which is being opened up. (June, pg. 308.)

Lake Erie and Northern Ry.—We are officially advised that no tenders have yet been accepted for the building of the line; however, it is expected to start work on the construction of the Brantford-Galt section this season. It is intended to build and operate the line temporarily as a steam road, pending a decision as to the system of electric operation to be adopted.

The line will extend from Port Dover via Brantford to Galt. The location plans show a maximum gradient of 1% and a maximum curvature of six degrees. The cut and fill work will average about 20,000 cubic yards a mile. There will be two large bridges on the line, one 450 ft. long, the other 438 ft. W. P. Kellett, Brantford, Ont., is Chief Engineer. (Sept., pg. 468.)

Lethbridge Municipal Ry.—The electric railway in Lethbridge, Alta., was put in operation Aug. 18, with a temporary power installation. The generator broke down after three days' operation, and as it was impossible to make repairs, traffic was stopped. The service will not be resumed until the permanent power plant has been installed. The machinery is in course of delivery. (Sept., pg. 468.)

London and Northwestern Ry. of Canada.—London, Ont., press reports state that the Mackenzie, Mann and Co. interests have acquired the charter rights of this company, which has power to build an electric railway from London to Sarnia, Ont. D. A. Stewart, London, Ont., is principally interested. (April, pg. 196.)

London, Street Ry.—C. B. King, Manager, is reported as stating that the second track work on several lines is well in hand, and that it is expected to have it finished by Dec. 1. The question of the removal of the line on Wellington st. is still under consideration. (Aug., pg. 421.)

Montreal and Southern Counties Ry.—A franchise for the operation of a street railway in Granby, Que., has been granted to the company by the city council, and press reports state that construction will be started shortly. (Sept., pg. 468.)

Montreal Tramways Co.—We are officially advised that the press reports stating that the company has spent \$500,000 in buying a right of way from Henderson station to the city limits, a distance of about two miles, and that a stub line is to be built along it, are incorrect. (Sept., pg. 468.)

Moncton Tramways, Electricity and Gas Co.—We are officially advised that a car service was started over a section of the Moncton and Buctouche Ry. (a steam line) Sept. 10. The cars are run along Harper St., from the King St. line, in Moncton, to the M. and B. Ry., thence along that company's tracks through Lewisville, Sunny Brae and Humphreys, N.B. With regard to the proposed loop line in the city, we are officially advised that nothing has been decided.

A meeting of shareholders was held at Moncton recently for the purpose of confirming a bylaw passed by the directors authorizing the issue and sale of a portion of the unissued capital stock at a discount, in connection with the sale of certain bonds or debentures. (Sept., pg. 468.)

Morrisburg and Ottawa Electric Ry.—At a special meeting of shareholders in Ottawa, Aug. 29, J. G. Kilt, R. J. Biggar, Ottawa; and J. W. Bogert, Morewood, Ont., were added to the directorate. R. A. Bishop resigned from the directorate, but retains his position as Secretary-Treasurer. The plans

for the entrance of the line into Ottawa were under consideration, but no decision was reached. One of the directors is reported as stating after the meeting that no proposition had been made for an amalgamation with the Ottawa and St. Lawrence Electric Ry. (Sept., pg. 468.)

Niagara, St. Catharines and Toronto Ry.—The Board of Railway Commissioners has approved of location plans of the extension of the line from the crossing of the Welland canal, St. Catharines, mileage 0.75, to Niagara-on-the-Lake, Ont., mileage 11.

We are officially advised that construction will be started at once on the building of the new line from St. Catharines to Niagara-on-the-Lake, the location plans for which have been finally approved by the Board of Railway Commissioners. It is expected to have the extension ready for operation early in 1913. (Aug., pg. 421.)

Niagara, Welland and Lake Erie Ry.—The Board of Railway Commissioners has approved of location plans for the line in Welland, Ont., including crossings of the G.T.R. and Michigan Central Rd. (Aug., pg. 421.)

Nipissing Central Rd.—The location plans of the extension of the line from Haileybury to New Liskeard, Ont., have been approved by the Board of Railway Commissioners.

The Cobalt town council, Sept. 4, approved of the company's proposal to connect its line with the Timiskaming and Northern Ontario Ry. at North Cobalt and to run its cars over the steam railway tracks to Cobalt station. (Aug., pg. 421.)

Regina Municipal Ry.—Good progress is reported to have been made on the extensions of the electric railway in Regina, Sask. Steel was expected to be laid on Dewdney St.-Mounted Police barracks section, and on the Victoria Ave. section by the end of September, and substantial progress has been made on other sections. Supt. Doughty is preparing plans for building further extensions during 1913. Press reports state that the plans will provide for the expenditure of about \$600,000 on new construction.

A proposition is under consideration by owners of real estate for the building of about six miles of line, the same to be handed over to the city for operation on completion. (Aug., pg. 421.)

Ottawa Electric Ry.—The Ottawa city council was informed Sept. 6 that the company proposed to start work on several extensions in the spring of 1913. (June, pg. 309.)

Ottawa, Rideau Lakes and Kingston Ry.—Press reports state that surveys are to be made at once for the building of a branch from the projected main line at Lombardy, to Perth, Ont. The cost of the work will, it is said, be borne by the municipalities. (Sept., pg. 468.)

Port Arthur and Fort William Electric Ry.—The ratepayers of Port Arthur, Ont., passed bylaws Sept. 16 to issue debentures as follows:—\$4,300, to extend the electric railway on Queen st., from Algoma st. to High st.; \$2,600, to extend the electric railway from its present eastern terminus to Hodder ave.; \$34,000, to extend the electric railway easterly to Hedge siding; \$32,200, to construct a belt line electric railway; and \$12,500, to open up a new street from Hodder ave. to Hedge siding, in connection with the second and third of the proposed extensions. (Sept., pg. 468.)

Sandwich, Windsor and Amherstburg Ry.—The Walkerville, Ont., town council has granted the company permission to lay a second track on Wyandotte st., from Kildare road, to the western limits of the town. (July, 1911, pg. 685.)

Saskatoon Municipal Ry.—We are officially advised that the contract entered into between the city and the Stone and Webster Engineering Co., Boston, Mass., provides for the building of 12 miles of single track in the city; the installation of two 300 k.w. motor generator sets, together with the necessary switchboard apparatus, etc., in the present power station, and the construction of a brick and timber car barn for 18 single truck cars. (Aug., pg. 422.)

Simcoe Ry. and Power Co.—We are officially advised that the company has developed a water power at the Big Shute on the Severn river, and is transmitting power to Midland, Penetang and Orillia, Ont. It is proposed to build a transmission line to Collingwood, Barrie and other points. At present a duplicate transmission line is being built from the Big Shute to Waubesa-shene. Nothing has been done under the company's railway charter, and another officer of the company adds, "There is nothing doing." (Sept., pg. 468.)

Stratford St. Ry.—It is said that the negotiations between the Mackenzie, Mann & Co. interests and the company have been abandoned, owing to failure to come to terms with the Hydro-Electric Commission as to power, and that an endeavor is to be made to secure a new franchise from the Stratford, Ont., city council. (July, pg. 368.)

Toronto and York Radial Ry.—The Toronto city council is taking steps to take over the portions of the company's lines within the city limits in East Toronto, and on the Lake Shore road, at the expiration of the franchises in November. (Aug., pg. 422.)

Toronto Eastern Ry.—We are officially advised that about seven miles of grading have been completed west of Bowmanville, and that it is hoped to have the grading and track laying from Bowmanville to Pickering completed this year. (Sept., pg. 468.)

Toronto Suburban Ry.—Plans are under consideration for the laying of a new single track line on Pacific ave. to Dundas st., West Toronto. The whole of the company's existing lines are, it is said, to be relaid to standard gauge.

Considerable grading has been done on the extension west of Islington, but progress is not so rapid as was anticipated owing to difficulties in acquiring the right of way, and the scarcity of teams and men. No further sub-contracts have been let by Ewan Mackenzie, the general contractor. (Sept., pg. 468.)

Winnipeg Electric Ry.—We are officially advised that the company is extending its tracks on Broadway, Winnipeg, from Osborne st. to Sherbrooke st.

The municipality of St. Vital, Man., has granted a franchise to the company for 30 years, for the operation of an electric car line, which must be in operation to St. Vital road by Nov., 1913, and completed throughout the municipality by Nov., 1914.

The Winnipeg Electric Ry., which owns the Winnipeg, Selkirk and Lake Winnipeg Ry., has secured from the Winnipeg city council, the right of way of the city's line to Stony Mountain, Man. Additional land has been secured to connect the company's line with the newly acquired property, and for the extension of the line to Stonewall, a total distance of 17 miles. Press reports state that work is to be started at once on the building of the line, as the agreement with Rockwood municipality calls for operation of cars by Dec. 1. (Aug., pg. 422.)

The Quebec Ry., Light, Heat and Power Co.'s employees' annual picnics were held at Cape Tormente, Sept. 15 and 22.

Electric Railway Notes.

The Hamilton city council is calling upon the Hamilton Street Ry. to add about a dozen new cars to its rolling stock.

The Sarnia, Ont., Street Ry. began re-operating its line Sept. 11, after having been out of business for six weeks owing to the destruction of the power house.

The Grand Valley Ry., which has not been operated in its entirety since March, is again running its cars over the whole line from Brantford to Galt, Ont.

The Winnipeg Electric Ry. has been declared by a decision of Chief Justice Mathers to possess all the rights of the Manitoba Electric and Gas Co., so far as the city of Winnipeg is concerned.

The Lethbridge Municipal Ry. has received five single truck city cars, equipped with Westinghouse 101-B-2 motors, single end operation, with pay-as-you-enter vestibules at the rear ends, from the Preston Car and Coach Co.

The Lethbridge Municipal Ry. was only able to run its cars for three days, Aug. 18 to 21, owing to the breakdown of the temporary power plant. The passengers carried numbered 15,082, and the receipts were \$1,037.35.

The Guelph Radial Ry. has ordered a standard long broom, single truck, snow sweeper, with standard steel underframe, steel tired wheels, double end control, equipped with Westinghouse 101-B-2 motors, from the Preston Car and Coach Co.

The New Brunswick Board of Public Utility Commissioners has approved of the following rates of fare on the Moncton Tramways Electricity and Gas Co.'s line: Single fares, 5c.; ordinary tickets, 6 for 25c.; workmen and children's tickets, 8 for 25c.

F. C. Clarke, of New York, has been appointed Chief Engineer, Toronto Ry., Toronto Power Co. and Electrical Development Co. of Ontario, succeeding W. H. Fisher, who has been acting temporarily since W. B. Boyd resigned a short time ago.

The Montreal Tramways Co., by one of its shareholders, has entered an action with a view of preventing the city carrying out a contract with the Canadian Autobus Co., on the ground that the M.T.C., as owning the Montreal Street Ry., should have the option of refusing to enter into such a contract.

In fining the driver of a team for obstructing an electric car at Regina, Sask., Sept. 9, the police magistrate found that the driver had an opportunity of turning out before he did, but expressed the opinion that the cars had not an exclusive right of way on any street in the city. The electric railway is owned by the city.

The city of Saskatoon, Sask., has ordered 12 single truck motor passenger cars in the U.S., for its municipal railway. They will measure 34 ft. 4 ins. over bumpers, 21 ft. 4 ins. over corner posts, and will be equipped with electric heaters, electric bell ringer system, reversible rattan cross seats, headlights, window guards, storm sash, curtains, hand straps, registers, destination signs, trolley catchers, life guards, trackscrapers, and mounted on no. 72 single trucks.

The Regina, Sask., city council's street railway committee recommends the purchase of the following rolling stock for 1913 delivery:—Eight double truck cars at \$6,500 each; six single truck cars at \$4,500 each; one snow sweeper, \$4,100; one 5,000 gal. sprinkler, \$6,000; six gravel dump cars at \$700 each; 18 garbage cars at \$450 each; 4 construction flat cars at \$1,000 each, and 1 construction motor car, 28 ft. long, \$2,500.

Marine Department.

The Canadian Pacific Railway's New Trans-Pacific Steamships.

The first of the two steamships which are being built as additions to the C.P.R. Co.'s trans-Pacific fleet, the *Empress of Russia*, was launched at Glasgow, Scotland, Aug. 28, the christening being performed by Mrs. H. W. Beauchlerk, of Montreal, eldest daughter of Sir Thos. Shaughnessy, the C.P.R. Co. being represented by G. McL. Brown, European Manager, in the unavoidable absence of A. Piers, Manager of Steamships, who was in Canada at the time. The second vessel, the *Empress of Asia*, will probably be launched in October.

These vessels will connect with the C.P.R.'s western terminus at Vancouver, and will steam direct to Yokohama, thence to Kobe and Nagasaki, where bunkers will be replenished for the round trip to Shanghai, Hong Kong, and back. Coal will again be shipped at Nagasaki for the return trip via Kobe and Yokohama to Vancouver. This programme involves very large radius of action, the distance between Vancouver and Nagasaki being over 5,000 nautical miles. The problem of carrying sufficient coal for a high rate of speed for so long a distance, together with adequate allowances of space and weight of cargo, passengers, stores and fresh water, is a serious one, especially in view of the decision to increase the sea speed from the 16 knots of the present services to 18 knots for the new vessels. The present trans-Pacific traffic was until recently carried on by the three screw vessels, *Empress of China*, *Empress of India* and *Empress of Japan*, each 450 ft. long and of about 6,000 tons gross register and built in 1891. The *Empress of China* was wrecked some few months ago, leaving only the two other vessels on the route.

These two new vessels, which will be ready to go into service early next summer, are very much larger than any of the present fleet, being 590 ft. long, 68 ft. beam, and 46 ft. deep, with about 15,000 gross tonnage. The turbine system of propulsion has been adopted by the C.P.R. for the first time, in these vessels which are to be propelled by four screws by four sets of turbines, and will have an average speed of 18 knots an hour. They will embody all the latest improvements, both for the safety and comfort of passengers. On a load draught of 29 ft. they will carry ample coal for the trip from Vancouver to Nagasaki, together with about 3,000 tons of cargo deadweight, and 1,500 tons of passengers, baggage, stores and fresh water.

In the construction of these vessels a radical departure from the current structure has been made in building them with cruiser sterns and the rudders entirely underhung. This form of stern, besides giving the vessels a very distinctive appearance, increases the effect of length of water line, thereby assisting propulsion, and also adds considerably to the available deck space at the after end. They will have five decks and in addition a long combined forecastle and bridge deck. Above the bridge deck will be located the principal first class public rooms, with the officers' quarters and navigating bridge overhead. In the dining saloon tables will be arranged to suit the demands of various passengers. Very small tables will be provided to accommodate two and four persons and larger ones for parties of six will be arranged in alcoves, while there will be still larger tables for other parties.

Accommodation will be provided for 200 first class, 100 second class and 800 third

class passengers, the two latter classes being for Asiatics. A number of single as well as double berth rooms will be provided so that the growing class of passengers who desire privacy can be taken care of. There will also be a number of suites consisting of bed room, sitting room and bath room. Besides the usual spacious dining saloon, lounge, cafe, library and writing room, a large gymnasium will be provided on the upper deck. It is to be fitted up with a large variety of exercising machines. Another feature adopted for the first time will be the laundry, which will be found of great convenience, especially in the hot weather on the Chinese coast.

The hold, orlop and lower decks beyond the machinery spaces will be arranged to carry general cargo. On the main deck forward the ship's mail room will be fitted the full breadth of the ship, and spaces for portable steerage or cargo. Amidships on this deck will be stowed the ship's stores.

The vessels will have a double bottom, orlop, lower, main, upper and shelter decks. Above the latter there is to be a long, combined forecastle and bridge, the bridge deck gating bridge over. There will be two pole

and cold chambers; abaft this will be accommodation for stewards and firemen. Between the firemen's quarters and the stern, provision will be made for carrying valuable cargoes of silk. Five hundred Asiatic steerage, in suitably divided compartments, large airing and dining accommodation, ample cooking and pantry space, and commodious wash places will be arranged for on the upper deck aft and amidships on the port side. On the starboard side aft of amidships staterooms for four persons will be fitted up for second class passengers. Forward of these on the same side will be a number of rooms for first class passengers. The upper deck forward will be taken for the accommodation of seamen and petty officers. On the shelter deck just forward of midships will be the first class reception room and cafe, 44 by 64 ft., with large embarking gangways on either side of the ship. Access to all the first class accommodation and public rooms will be gained from this reception room. Immediately forward on this deck will be large staterooms for two and three persons. Adjoining the cafe on the aft side will be the main saloon, 74 by 64 ft., lighted from

Canadian Pacific Ry. Trans-Pacific s.s. *Empress of Asia*.

being extended to the stern on side stanchions. Above the bridge deck will be a promenade deck about 350 ft. long on which will be the principal first class public rooms, with the officers' quarters and navigators and three funnels, straight stem, and as before mentioned, cruiser stern. In order to secure the safety of the vessels in the unlikely event of collision or grounding, the hulls are to be sub-divided by numerous watertight bulkheads, closely spaced in accordance with the recommendations of the bulkheads committee, in such a manner that even should any two adjacent compartments be simultaneously laid open to the sea, the weather deck would still be about 18 ft. above water. In addition, the usual complement of lifeboats and lifebelts will be carried, and there will be an installation of wireless telegraphy. The vessels are being constructed under the supervision of Lloyd's Register Society and will be classed by them 100 A1, three deck and shelter deck, with freeboard restricted to conform to the bulkhead spacing.

the sides from a number of beautifully designed windows nearly 5 ft. wide, and from above by a large well, 26 by 16 ft. The tables will be arranged to suit the demands of various passengers, from small ones for two and four persons to semiprivate tables for six arranged in alcoves, and larger tables for larger parties. In the central part of this deck will be the main kitchen, the pantries, cold larders, bakery, etc., equipped with all the latest hygienic and labor saving devices necessary for effectively serving the first and second class passengers. To minimize the running to and fro a number of electric lifts will be erected between the main kitchens and the various stores, and the number of 'b deck' pantries will be installed on the bridge and promenade decks above. Aft the galley and adjoining the turbine hatch, within easy reach of the promenade on the shelter deck will be the engineers' quarters, so arranged as to give the maximum comfort to the engine room staff in hot weather. Within easy reach of their cabins on the upper deck, and leading

direct to a covered promenade on the shelter deck, will be second class entrance and lounge, which in turn will lead to the second class saloon. These rooms will be fitted in a large, airy deckhouse about 50 by 48 ft. and 9 ft. high, lighted on three sides by large plate glass windows. At the aft end of the shelter deck, isolated from the first and second class, a large covered airing space for Asiatic steerage will be provided. The hospitals, laundry, embalming room, etc., will be at the extreme aft end of the ship on the shelter deck.

Ascending the grand staircase from the reception room the first class staterooms on the bridge deck will be reached. These rooms will be enclosed in a complete steel deckhouse 340 ft. long. Each of these rooms will be 10 by 9 ft., with sleeping berths for two persons, and a couch so arranged as to be easily converted to a bed should it be found necessary. The sleeping berths again are so designed that should one passenger only engage the room, all evidence of the other berth will be hidden, leaving only a single brass bedstead. Another feature will be that two staterooms can be converted into one suite, with dressing room (with hot and cold water) adjoining. Surrounding the deckhouse will be one of the first class promenades, on either side of the house on the straight this promenade will be 430 ft. long, with a maximum width of 8 ft. At the aft end for 100 ft. it will extend from side to side of the ship. Encircling the promenade at the forward end of the deckhouse a screen will be erected at the ship's side and across the ship 8 ft. in front of the house, with large observation windows, which will give a sheltered promenade 240 ft. long. Forward of the screen the bridge deck will continue to the fore-castle deck, and will be fitted with powerful cable holders and capstans for quick and efficient handling of the vessel. At the head of the grand staircase will be the promenade deck, with a deckhouse 320 by 44 ft., in which will be first class staterooms for one and two persons, parlor suites of two, three and four rooms, all self contained with bathroom, dressing room and lavatory accommodation. At suitable intervals in the deckhouse other stairways will be fitted, giving easy access to the first class on the bridge deck below and the saloon on the shelter deck. Midway in the length of the deckhouse will be the lounge, 48 by 38 ft and 14 ft. high at the centre. Further aft a writing room will be introduced and at the aft end a smoking room and verandah cafe 57 by 40 ft., and 14 ft. high. Around the deckhouse will be an open promenade with screen protection at the forward end, similar to that fitted on the bridge deck. On the house top, with an internal stairway from the deckhouse on the promenade deck, a large gymnasium, 16 by 28 ft., will be fitted up with exercising machines. The officers' accommodation and navigating bridge, forward on the house tops, have received special consideration, in view of the length of the voyage and the variety of climates the ship will pass through. All the latest devices for the quick handling and control of the vessel will be installed. A dining room, served by an electric lift from the ship's main pantry, and a cosy smokers room will be among the arrangements provided to conduce to the officers' comfort. The outstanding features of these vessels will be the size, design and quality of the public rooms, parlor suites, special and ordinary staterooms, also the large proportion of the second class and Asiatic accommodation. The public rooms in the one ship will be of English design and in the other of French. Among other special features worth mentioning are the various methods of heating and ventilating the ships. Each first class room or public

room can be heated and ventilated on the thermo tank principle, and also the second and the steerage accommodation, about 20 of these tanks being distributed throughout the length of the vessels. Natural ventilation will also be provided in various sections. Electric radiators and electric fans can be used in the state or public rooms should conditions so demand.

The sanitary accommodation will be of the most improved description, each group of lavatories being fitted with an ample number of baths, showers, washbasins, etc., supplied with hot and cold sea and fresh water passing through specially designed filters. A powerful electric suction fan in each section will keep the lavatories fresh. The electric generating plant will consist of five independent sets of engines and dynamos, provides a complete system of electric lights, radiators, and power for the large stokehold fans, also for the ventilating fans throughout the ship, and the silent working cranes and winches for rapid handling of cargo. Signalling at sea can be carried on by a semaphore on the bridge, of the type used in the British Admiralty for short distances. A Morse lamp for night signalling and the long range Marconi system will be installed.

The propelling machinery will consist, as above stated, of four turbines, embodying the most recent improvements in design and construction to ensure the maximum economy of fuel consumption on service attained. The port wing shaft will be driven by a h.p. turbine which will exhaust into a l.p. turbine driving the starboard wing shaft. The two inner shafts will each be driven by a l.p. turbine, which will have a powerful astern turbine incorporated in the same casing. The introduction of a l.p. turbine to the installation will provide a much wider range for the expansion of the steam, and will effect a marked improvement in steam consumption as compared with the usual arrangement of turbines, driving either three or four shafts, hitherto adopted in large mail steamships and naval vessels. Hitherto these have been fitted with either one h.p. turbine, exhausting to two l.p. turbines, or two h.p. turbines, exhausting to two l.p. turbines. For manoeuvring when entering or leaving harbors, independent high pressure steam connections will be provided on each l.p. ahead turbine. An independent high pressure steam connection will be provided on the l.p. turbine, which, combined with a suitable arrangement of valves, will enable the h.p. turbine to be cut out, or should the l.p. turbine be out of action, the h.p. turbine will be able to exhaust direct into one or other or both of the l.p. turbines.

The four turbines will be situated in one watertight compartment, and in a separate compartment immediately aft, two condensers will be placed, together with the circulating pumps, dual type wet and dry air pumps, evaporators and distillers. The circulating and air pumps will form two distinct and separate sets, each set working in conjunction with one condenser, and independent of the other, but they will also be arranged with suitable cross connections, so that either set of pumps may, in case of emergency, work in conjunction with both condensers. The installation of auxiliary machinery will be exceptionally large, and, as in the case of the turbine installation, has been designed with a view to securing the greatest economy in fuel consumption and convenience in working. The feed water system for the boilers will comprise two twin filters of the gravitation type, through which the water from the air pumps will be discharged on its way to the hotwell tanks; and two hotwell pumps, which will discharge the feed water, first through a surface feed water heater, and

afterwards through a contact feeder from which the four feed pumps will take their supply and discharge direct to the boilers. The feed water will be heated by the exhaust steam from the auxiliary machinery throughout the ship, the steam from the ship's heating systems and drainage systems from steam pipes, etc. The system evolved is the result of careful consideration, and will ensure that all waste heat from the auxiliary steam and exhaust systems will be utilized in heating the feed water instead of the heat being carried away by the circulating water from the condensers.

For harbor use, a separate auxiliary condenser with circulating pump, air pump, feed filter and feed pump will be fitted, to admit of the corresponding auxiliary machinery used on service being opened out for cleaning and examination as necessary. All the bearings for the turbine and line shafting will be connected to the forced lubrication system, and the oil supply will be maintained by four large oil pumps which will discharge the oil through special coolers before entering the bearings. Separate pumps will be fitted for circulating cold sea water through the oil coolers. Drain tanks, into which the oil will gravitate from the bearings and settling tanks, for separating any water or impurities from the oil, will be fitted in the condensing room. The pumps for ship's service will consist of two general service pumps, three sanitary hot and cold water pumps, two bilge pumps, two fresh water pumps and a ballast pump.

The refrigerating machinery and electric machinery will be situated in a separate compartment aft of the condenser room. In view of the service in which these vessels are to be engaged, the installation of refrigerating machinery will be very large, and will comprise two machines of the CO₂ type. The electrical generating machinery will consist of four independent units, each of which will comprise a compound wound dynamo, driven by an enclosed forced lubrication compound engine.

Steam will be generated in six large double ended boilers and four single ended boilers, situated in three separate compartments and working under forced draught, the air supply being maintained by an installation on the main deck. Two pole masts and three large and well proportioned elliptical funnels, one for each boiler compartment, will give the vessels a strikingly handsome appearance. For dealing with the ashes at sea, ash ejectors will be fitted in each stokehold, and in each boiler compartment a specially designed ash ejector pump for supplying the water under pressure to the ejectors will be fitted. Steam ash hoists of a silent type will also be fitted in each boiler compartment for harbor service. The ash hoisting arrangements have received special consideration, in order to minimize the noise which is so objectionable, and this machinery will therefore be removed entirely from the vicinity of the passenger quarters.

The report of the British Government commission, headed by Lord Mersey, which investigated the loss of the s.s. Titanic has been published in pamphlet form under the title "Shipping Casualties (Loss of the s.s. Titanic)." It may be purchased from Wyman & Sons, Ltd., Fetter lane, London. E.C., price 7½d.

Work was commenced early in September on the construction of the wharf at Port Moody. It is expected that it will be completed during October, when there will be no difficulty in bringing ocean going vessels right alongside. There is a depth of 60 ft. in the harbor. The contract price is \$8,500.

The Floating Dry Dock for Montreal.

The dry dock, of which some particulars have already been given in Canadian Railway Marine World, which is to be established at Montreal as a part of Canadian Vickers Ltd., dry dock and shipbuilding plant, left Barrow-in-Furness, Eng., for Montreal, Aug. 29, in tow of two powerful steam tugs, specially engaged from a firm in Holland, who make a specialty of this

intercostal between the transverse girders. Under the wall, in addition to the transverse lattice girder, intermediate transverse ordinary frames are placed $2\frac{1}{2}$ ft. apart, and prolonged upward, forming the ordinary frames of the walls. The centre bulkhead between the transverse girders, is stiffened by vertical breathing plates, also stiffened and connected to a longitudinal curtain

ft. below the top deck, and made water tight. Each wall is divided, in addition to the joint chambers, into 10 water tight divisions by plate bulkheads, in line with the bulkheads of the pontoon, of which they are a continuation. A docking land is formed at each end of the wall, on which the central portion can rest when being self-docked. The framing of the walls is both braced and ordinary. The frames consist of single angles stiffened by vertical web plates, the front and cross frames being cross connected by diagonals and gussets. The ordinary frames of the walls consist of single angles back and front, cross connected by horizontal struts. About a foot below the top deck a running deck is arranged from one end of the dock to the other, outside the stanchions, to enable the ropes to be handled easily, and timber heads and other fittings required for berthing vessels are placed on this deck. Two other platforms, known as the painting and shoring platforms, are placed 15 and 29 ft. respectively, below the running deck.

Each end of the centre section and each square end of the terminal sections is provided with a joint chamber, so that the sections can be joined, or parted. For dealing with trading vessels, not of large weight or dimensions, the dock has been designed so that it can be worked in two independent units of unequal size, and to enable a rapid connection of the two portions to be made, cast steel rocking joints, in the form of knuckles, are fitted to the level of the keel blocks. The pumps are driven by steam supplied by boilers carried on the dock, each installation consisting of two boilers, two engines and pumps placed in specially built chambers on one of the walls. The pumps are of the centrifugal type, 17 ins. diam., and are seated on the main drain at the bottom of the dock, from which compartment pipes are led to each separate water tight division. Each compartment is governed by its own sep-

Floating Ship Dry Dock, Duke of Connaught, for Montreal.

class of work. One of the tugs is equipped with a wireless telegraph installation, so that immediately the tow enters the area of communication, reports of the progress will be kept up. The arrival on this side was expected about the end of September, or early in October, the longer, or extreme southern route being taken, so that in case of accident, the Azores might be made.

The dock is of the double sided, self docking type, on the bolted sectional principle, consisting of a pontoon or lifting portion, and parallel side walls, built on and forming a part of same, and the whole divided into three complete, separate sections, which when bolted together form the complete dock. These sections are so arranged that when the dock is separated into three parts, any two of them can dock the remaining third between them, and for this purpose, each section is fitted with independent pumping machinery, so that it can act as an independent unit. The construction has been so carried out that it is suitable for lifting a modern British battleship, the pontoon deck having been specially stiffened for the support of a large portion of the weight of the vessel on the side, or bilge, as well as the central keels.

The pontoon consists of a rectangular structure, plated all round except the portion of the deck directly under the walls, and stiffened internally by longitudinal and transverse girders. It is divided into three sections, the two end sections having their outer extremities built in the form of a point or bow, ending in a working platform arranged on plate and braced girders. The bottom plating, except under the walls, runs transversely, and is connected with the plating of the sides and points by chine angles, and the top or deck plating, which is arranged in the same manner, is similarly connected with the face of the side wall. The pontoon is divided into four compartments, by three longitudinal intercostal water tight plate bulkheads, and transversely it is divided into 54 bays, of which 17 are in each end section, by transverse girders, consisting of plate bulkheads. Special lattice girders are used in the compartments under the walls, instead of plate girders. In addition to the bulkheads, the deck and bottom platings are stiffened by a series of longitudinal frames running fore and aft over the length of the pontoon,

plate. Outside this last mentioned framing, the pontoon deck and bottom are stiffened by longitudinal framings of angles connected to the transverse bulkhead stiffeners by gussets and diagonals. These extend to the face of the wall, and in the centre section several of these frames are provided with plates riveted to them to take the load from the side keel blocks. The intermediate longitudinal bulkheads are formed of vertical plates, intercostal between the girders to which they are attached, as they are also to the top and bottom plating. In

Floating Ship Dry Dock for Montreal; Interior.

order to facilitate the complete withdrawal of all water in the pontoon, shallow troughs, forming a gutter, are fitted. The walls of the dock are plated horizontally and have a batter on the inside wall. The top deck of the walls is plated longitudinally, and is connected to the side plating by double chine angles. All the machinery of the dock is placed on an engine deck about 16

feet below the top deck, and made water tight. Each wall is divided, in addition to the joint chambers, into 10 water tight divisions by plate bulkheads, in line with the bulkheads of the pontoon, of which they are a continuation. A docking land is formed at each end of the wall, on which the central portion can rest when being self-docked. The framing of the walls is both braced and ordinary. The frames consist of single angles stiffened by vertical web plates, the front and cross frames being cross connected by diagonals and gussets. The ordinary frames of the walls consist of single angles back and front, cross connected by horizontal struts. About a foot below the top deck a running deck is arranged from one end of the dock to the other, outside the stanchions, to enable the ropes to be handled easily, and timber heads and other fittings required for berthing vessels are placed on this deck. Two other platforms, known as the painting and shoring platforms, are placed 15 and 29 ft. respectively, below the running deck.

pressed air, and controlling same from a distance by valves operated by electromagnet. Each valve house is connected by telephone with its engine room and with the others when the dock is working as a single unit. Each section is also provided with a direct acting steam pump arranged to draw from the sea, capable of providing a full stream of water for fire service or washing down vessels. These are also connected to the main drain so that they may be used as a drainage service for completely emptying the compartments. Two similar steam pumps are also fitted on the opposite wall of the dock.

Steam heating is provided to prevent freezing of water in the compartments, and each water tight compartment is equipped with an indicating system to show, in the valve house, the level of water in the compartment, and a similar arrangement is supplied to show the draught of water over the keel blocks. Four steam capstans are provided on each of the two walls, the spindles being carried down vertically to the level of the pontoon deck, where, in a small chamber in the wall, cable lifters are fitted, so that the mooring cables may be hauled in or paid out when the dock is being moved. Donkey boilers are fitted on the opposite wall to that on which the main boilers are fitted, to provide steam for the capstans and fire pumps on that wall. On the top deck of this wall a three ton electric travelling gantry crane is placed, arranged to traverse the whole length of the wall, and at both ends of the combined dock two flying gangways or swinging bridges are placed, giving access to each wall. The dock is lighted throughout by electricity, the outside lighting being by bracket standards with a cluster of lamps, the box terminals are fitted on the walls, from which lamp clusters can be taken by flexible leads for lighting any particular point. The current is to be supplied by cables from the shore.

The dock is supplied with the usual bollards and timber heads, and roller fenders are also fitted to protect the walls from an entering vessel. Eight mechanical side shores, four on each wall, are provided, which can be screwed in or out by a standard fitted on the top deck. The keel blocks are strongly made and closely spaced to take the weight of the heaviest vessels, and ladders are fitted leading from the upper deck of the dock to the pontoon deck, and to the various compartments.

Following are the general dimensions of the dock:—

Length over platforms	600 ft.
Length over pontoons	550 1/4 ft.
Width over all	135 ft.
Depth of pontoon at centre	17 ft.
Length of side walls	470 1/2 ft.
Height of side walls above pontoon deck ..	42 ft.
Width of side wall at base	17 1/2 ft.
Width of side wall at top	12 1/2 ft.
Clear width between roller fenders	100 ft.
Draught of vessel	27 1/2 ft.
Lifting capacity	25,000 tons.

The accompanying illustrations show the interior of the dock, and the completed dock as viewed from the water.

This dock is the fourth largest in the world, the largest with a lifting capacity of 40,000 tons, and the second largest, of 35,000 tons, being owned in Germany, while Great Britain owns the next largest, the twin docks of 32,000 tons lifting capacity each.

Gaspé Bay Developments.

An important development is taking place in Gaspé bay, Que. With a view to provide for ocean steamship traffic, work is proceeding on the construction of a breakwater at Sandy beach, on the south coast, the contract for which was given to Horace Dus-

sault, of Quebec, in April, 1910, for \$273,985. The structure consists of two parallel cribs, 15 ft. wide at top, 18 ins. above low water mark, with a 12 ft. trestle on top of the cribs. The breakwater will be 1,000 ft. long and 95 ft. wide at top, starting at the 15 ft. line and running to the 50 ft. line of water at low water. J. T. Bertrand, District Engineer, Public Works Department, is in charge, and progress estimates have been received for \$157,360, of which \$144,310 has been paid. As far as can be ascertained, no arrangements have been made for any line of vessels to use the Gaspé route. A spur track has been built from the Atlantic, Quebec & Western Ry. to the Sandy bay breakwater.

Arrangements are being made by which some of the steamships operated by Henri Menier, proprietor of Anticosti island, will run between that place and Gaspé, carrying fish for shipment from Gaspé by rail. M. Menier will probably have a wharf of his own, either at or near Gaspé Basin.

Instructions for Vessels When Approaching Canadian Ports.

The Government having taken into consideration the fact that local, or other circumstances may arise in which it may be necessary, on account of periodical exercises, manœuvres, or otherwise, to forbid all entrance to certain ports of the Dominion, notice is given that on approaching Canadian shores, or any of the following ports, viz.:—Halifax, N.S.; Quebec, Que.; Esquimalt, B.C.; a sharp look out should be kept for the signals being displayed, and the distinguishing and other signals made by them. If entrance to a port is prohibited, three red vertical lights by night, or three red vertical balls by day, will be exhibited in some conspicuous position, in, or near to its approach, which signals will also be shown by the vessels appointed for examination purposes. If these signals are displayed, vessels must either proceed to the position marked "examination anchorage" on the Admiralty charts, and anchor there, or keep the sea. At the ports before-mentioned, searchlights are occasionally exhibited for exercise, and instructions have been given to avoid directing movable searchlights during practice on vessels under way, but mariners are warned that great care should be taken to keep a sharp look out for the signals indicated, when searchlights are observed to be working.

Under certain circumstances it may become necessary to take special measures to examine vessels desiring to enter the ports or localities referred to, and in such case, vessels carrying the distinguishing flags, or lights, already mentioned, will be charged with the duty of examining vessels which desire to enter the ports, and of allotting positions in which they shall anchor. As the institution of the examination service at any port will never be publicly advertised, special care should be taken in approaching the ports, by day or night, to keep a sharp look out for any vessel carrying the distinguishing flags or lights, already mentioned, and to be ready to bring to at once when hailed by her, or warned by the firing of a gun or sound rocket. By day, the distinguishing flags of the examination steamer will be a special flag, white and red horizontal surrounded by a blue border, and the blue ensign; also three red vertical balls if the port is closed; three white vertical balls if the port is open. The lights mentioned will be carried in addition to the ordinary navigation lights, and will show an unbroken light round the horizon.

Masters are warned that before attempting to enter any of these ports where the

examination service is in force, they must in their own interests, strictly obey all instructions as to entry given to them by the examination steamer, and in the absence of any instructions from the examination steamer, they must proceed to the position marked "examination anchorage" on the Admiralty charts and anchor there, or keep the sea. In case of fog, masters of vessels are enjoined to use the utmost care, and the examination anchorage itself should be approached with caution. The pilots attached to the ports will be acquainted with the regulations to be followed.

Any vessel approaching a defended port in the Dominion, when searchlights are being worked, and finding that they interfere with safe navigation, may make use of the following signals, either singly, or combined,—by flashing lamp, four short flashes followed by one long flash, or by whistle, siren or fog horn, four short blasts followed by one long blast. Whenever possible both lamp and sound signals should be used. On these signals being made the searchlights will be worked so as to cause the least inconvenience, either being put out, raised, or their direction altered. The signals should not be used without real necessity, as unless the vessel is actually in the rays of the searchlight, it is impossible to know which searchlight is affected.

The Canadian Interlake Line's Vessel Fordonian.

The vessel Fordonian, which has been built at Glasgow, Scotland, for the Canadian Interlake Line Ltd., for operation by the Merchants Mutual Line in the lake trade, is on its way to Toronto, having left Glasgow, during September. She is of the ordinary type of lake and canal vessel, but is equipped with a Carels-Diesel engine of the four cylinder, two cycle type, of 800 b.h.p., developing 200 b.h.p. per cylinder. In vessels of this type, the machinery space is considerably reduced, being only about one third of that of steam driven vessels, and economy of fuel is also an important consideration.

The Fordonian is the first vessel of this particular type to be built at Glasgow, and it is stated that she will have a radius of navigation, on the same bunker capacity as a steam driven vessel, of at least four times that of the latter, in addition to the time saved by being able to make an immediate start, and having no standby charges.

The whole of the machinery was built at Glasgow, with the exception of the cylinders, and the engine is built up of the highest powered units yet seen in a British marine heavy oil engine.

Her dimensions are:—length, 250 ft.; breadth, 42 ft. 8 ins.; depth, moulded, 16 ft. 10 ins. to main deck and 26 1/2 ft. to awning deck.

The U. S. Lake Survey reports the levels of the Great Lakes in feet above tidewater, for August, as follows: Superior, 609.49; Michigan and Huron, 508.58; Erie, 572.45; Ontario, 246.66. Compared with the average August levels for the past ten years, Superior was 9.25 ft. below; Michigan and Huron, 9.45 ft. below; Erie, 0.24 ft. below; Ontario, 9.94 ft. above. It was anticipated that during September, Superior would rise 0.1 ft.; Michigan and Huron, 0.2 ft.; Erie, 0.3 ft., and Ontario, 0.4 ft.

The East Side Fish Co.'s steam tug, which is being built at Collingwood, was launched there, Sept. 17. She is 77 ft. long, and equipped with fore and aft compound engines with cylinders 9 and 18 ins., diam., by 14 ins. stroke. She will be operated out of Port Stanley in the fishing trade on Lake Erie.

Statistics of Canadian Shipping.

The total number of vessels on the Canadian register for the year ended Dec. 31, 1911, was 8,088, measuring 70,446 tons, being an increase of 184 vessels and 19,517 tons over 1910. There were 3,444 steamers, with a gross tonnage of 588,741, included in the list, which, at an assumed average value of \$30 a ton for the net registered tonnage, represents \$23,113,380. The number of new vessels built and registered in Canada was 339, representing 27,736 tons net register, which, estimated at \$45 a ton, gives \$1,448,120 for new vessels. During the year 279 vessels were removed from the register, lists of which, together with details of new registrations, were given in Canadian Railway and Marine World, throughout the year. It is estimated that 41,447 men and boys, inclusive of the masters of the vessels, were employed on Canadian registered vessels during 1911. The number and tonnage of vessels, according to provinces, are as follows:

	Sailing ships and steamships	Steam-ships	Gross tonnage of steamships	Net tonnage of sailing ships and steamships
Ontario	2,014	1,472	255,628	236,877
Quebec	1,511	490	128,523	193,682
Nova Scotia	2,105	296	35,916	142,631
British Columbia	1,227	873	112,511	122,264
New Brunswick	965	200	39,890	55,872
P. E. Island	149	20	4,407	9,653
Manitoba	149	86	8,348	6,373
Yukon district	13	3	3,132	2,708
Saskatchewan	5	4	381	356
Totals	8,088	3,444	58,8741	770,44

In a list showing the net registered tonnage of the shipping of the various maritime nations of the world, Canada appears as the ninth.

Of the vessels which were removed from the Canadian register during 1911, 21 were sold to foreigners, 37 were wrecked, 15 stranded, 12 lost, 78 broken up, 10 abandoned at sea, 3 sunk in collision, 12 foundered, 31 were burnt, 2 condemned, 31 reported out of existence, 2 dismantled, 17 were transferred to Newfoundland, and 8 to Barbadoes.

Ports of registry are distributed as follows:—Ontario, 38; Nova Scotia, 21; New Brunswick, 7; Quebec, 6; British Columbia, 4; Prince Edward Island, Manitoba, Saskatchewan and Yukon territory, one each.

The ports having a net tonnage of 10,000 and over, are as follows:—

	Vessels. Sailing.	Steam.	Net tonnage.
Montreal	803	297	141,274
Victoria, B.C.	325	203	65,350
Toronto	352	285	57,513
Vancouver, B.C.	686	531	45,573
Quebec, Que.	618	158	45,097
St. John, N.B.	330	105	39,953
Ottawa	390	253	31,014
Windsor, N.S.	72	15	24,161
Lunenburg, N.S.	332	30	22,743
Kingston, Ont.	208	139	22,092
Halifax, N.S.	433	100	21,765
Midland, Ont.	30	24	16,214
Parrsboro, N.S.	87	7	15,659
Hamilton, Ont.	40	37	14,930
Collingwood, Ont.	78	73	14,659
Yarmouth, N.S.	310	38	13,624
Port Arthur, Ont.	80	55	11,159
S. S. Marie, Ont.	69	59	10,318

The vessels built and added to the register during 1911, according to provinces, were as follows:—

	Vessels.	Tonnage.
Ontario	42	10,086
British Columbia	98	7,781
Nova Scotia	136	5,340
Quebec	30	2,726
Manitoba	3	902
New Brunswick	25	774
Saskatchewan	1	66
Prince Edward Island	4	61
Totals	339	27,736
Totals, 1910	294	22,283

Canadian Notices to Mariners.

The Department of Marine has issued the following:—

65. Aug. 23. 180. Ontario, Detroit river, off southern end of Fighting island, spar buoy replaced by gas buoy. 181. Ontario, Lake Superior, east end, Whitefish bay, Ile Parisienne, light and fog alarm established. 182. Ontario, Lake Superior, Thunder bay, Port Arthur, Bare point, breakwater under construction, lights.

66. Aug. 24. 183. New Brunswick, Bay of Fundy, Grand Manan island, Ross island, Grand harbor, Fish Fluke point, character of light. 184. Nova Scotia, Avon river, Windsor bridges, arrangement of lights changed, new bridge being built. 185. Nova Scotia, south coast, Cross island, change in character of light. 186. Quebec, River St. Lawrence, Portneuf-en-bas lighthouse, slats placed in skeleton frame. 187. Newfoundland, south coast, St. Lawrence harbors, Middle head, fog alarm established.

67. Aug. 24. 188. British Columbia, Chatham sound, entrance to Prince Rupert, Holland island, lighthouse under construction, temporary light.

68. Aug. 26. 189. Quebec, River St. Lawrence, Beauport bank, conical buoy replaced by gas buoy. 190. Quebec, River St. Lawrence, Montreal harbor, Ile Ronde range, Ile Stc. Helene, lighthouse established.

69. Aug. 27. 191. Ontario, Lake Superior, eastern end, outer Pancake shoal, bell buoy replaced by gas and bell buoy. 192. United States of America, Lake Erie, Buffalo harbor approach, lightship established.

70. Aug. 27. 193. British Columbia, Thompson river, Kamloops lake to Little Shuswap lake, buoys and day beacons established.

71. Aug. 29. 194. British Columbia, Vancouver island, west coast, Clayoquot sound, Templar channel, telephone connection between Lennard island light-station and Tofino. 195. British Columbia, Vancouver island, east coast, Cordova bay, uncharted rock. 196. British Columbia, Strait of Georgia, Porlier pass, arc of visibility of front range light on Race point increased. 197. British Columbia, Chatham sound, Dundas islands, Hudson Bay pass, uncharted rock. 198. United States of America, Washington, Juan de Fuca strait, Neah bay, whistling buoy replaced by gas and whistling buoy, light discontinued.

72. Aug. 31. 199. Quebec, River St. Lawrence, St. Thomas channel, dredging, rearrangement of buoys, gas buoys established.

73. Sept. 5. 200. New Brunswick, south coast, Bay of Fundy, Musquash harbor, buoys established. 201. New Brunswick, south coast, Bay of Fundy, Cape Spencer, reported irregularity of light contradicted. 202. New Brunswick, east coast, Northumberland strait, Kouchibouguac bay, St. Louis gully, Kouchibouguac river, change in position of range lights. 203. New Brunswick, east coast, Kouchibouguac bay, Kouchibouguac river, change in position of range lights. 204. Prince Edward Island, south coast, Hillsborough bay, Charlottetown harbor, buoy re-established. 205. Newfoundland, Labrador, Belle isle, south end, position of main light, erratum in list of lights. 206. England, west coast, Trevose head light, alteration in character. 207. England, south coast, Lizard head, submarine fog signal established off.

74. Sept. 6. 208. British Columbia, Lama passage, Campbell island, Napier point, day beacon erected. 209. British Columbia, Queen Charlotte islands, entrance to Houston Stewart channel, beacon to be moved from Kova point to Danger rocks.

75. Sept. 7. 210. Quebec, Gulf of St. Lawrence, Magdalen islands, Grindstone

island, Etang du Nord lightstation, new lighthouse, change in character of light.

76. Sept. 11. 211. British Columbia, Queen Charlotte islands, Skidegate inlet, hydrographic information.

77. Sept. 12. 212. Ontario, Lake Erie, Port Burwell, change in position of back range light of inner range. 213. Ontario, Lake Erie, shoal off entrance to Port Stanley, caution. 214. United States of America, St. Lawrence river, Ogdensburg harbor, Ogdensburg light, red sector to be installed.

78. Sept. 13. 215. Ontario-Michigan, Detroit river, Livingston channel, aids to navigation to be established.

The White Star Steamship Britannic.

The Atlantic liner, which is being built at Belfast, Ireland, for the White Star Line, and which will be named the Britannic, will in general features be similar to the Olympic, but of somewhat larger tonnage. There will also be various improvements introduced into the new vessel, resulting from the experience gained from the Olympic, and profiting by the lesson of the Titanic disaster. The Olympic will also be altered at an early date with a view to making her what her owners believe will be the safest ship in the world. The general structural changes will be very few, the strength of the Olympic under all weather conditions having proved entirely satisfactory. In two important respects, however, both vessels are to bear evidence of the recent change in expert and public opinion as regards protection against the effects of collision, both by the introduction of a complete inner skin extending to a considerable height above the load line throughout the most vulnerable portions of the vessels, and also by the increased height and number of watertight bulkheads, so as to render both ships as nearly unsinkable as possible.

The inner skin will consist of heavy plating, well stiffened, extending for more than half the length of the vessel, from the watertight bulkhead in front of the forward boiler room to the after end of the turbine engine room, the inner skin being strongly connected to the outer shell by longitudinal plates and angles and specially strong connections at bulkheads and watertight divisions. The space between the outer and inner shells will be the width of the web frames at present in the ship, and this reinforced structure will run from the tank top, i.e., from the top of the double bottom, to a point well above the load water line. In addition, an extra watertight bulkhead will be introduced, and several of the existing bulkheads carried up to the bridge deck.

The additional strength and safety afforded by these methods will be easily appreciated. Hitherto it was considered sufficient if a vessel could float with any two compartments pierced; but the Olympic and Britannic, besides having this extra protection against serious damage, will, it is claimed, be able to float with any six compartments flooded; and with these special provisions it is not considered within the possibility of chance that so many compartments could be in this condition.

The Chief Engineer states, that every effort is being made to complete the excavation and the work on the locks of the Panama canal by June 30, 1913. He expects to see the level of Gatun Lake at 85 ft. some time in Sept., 1913. If this be accomplished and the first boat be successfully put through the canal, announcement will be made that it is in condition to pass shipping. This, he says, will allow of a year's try-out before the formal opening.

Allan Line Changes.

A number of changes in the directorate of the Allan Line have been announced recently, Sir H. Montagu Allan, one of the principal directors, and Bryce J. Allan, who has acted as Manager at Boston, Mass., for the past 25 years, have retired from active connection with the company. Sir Montagu Allan, is reported to have said, in connection with his retirement, that he had been impelled to take the step of leaving the management in the hands of Hugh, and Andrew A. Allan, because he wished to have more time to devote to other affairs.

Hugh Allan, who left Montreal a few years ago to take up his residence in London, Eng., it is reported, will continue to act as chairman of the company, and Andrew A. Allan will continue to represent the board in Canada. Andrew H. Allan, of Montreal, has been appointed Manager at Boston, Mass., succeeding Bryce J. Allan, and has left Montreal to take up his new duties. A number of minor changes are in contemplation.

Reports as to the amalgamation of the Allan Line with the C.P.R., are met by the statement of G. Hannah, Passenger Manager of the line at Montreal, that he personally believes that the so-called fusion is a newspaper story, and that no official notice of it has been received at the Montreal office, which would have been notified if it had taken place.

Atlantic and Pacific Ocean Marine.

The Allan Line steamships' first sailing from Halifax, for the winter season, is fixed for Dec. 7.

During August, 56 ocean going steamships arrived at Montreal, having a combined gross tonnage of 393,369 tons.

The C.P.R. s.s. Lake Champlain ran into a sandbank in the St. Lawrence river, off Dominion Park, Montreal, Sept. 3, and was released early the next morning without damage.

The New Zealand Shipping Co.'s s.s. Wakanui, which was scheduled to sail from Montreal, Sept. 15, was discovered to be on fire, Sept. 13. The damage to cargo is estimated at \$25,000.

The Allan Line s.s. Mongolian, while outward bound from Liverpool, Eng., for Halifax, N.S., is reported to have run aground in the River Mersey, Aug. 31. The accident was due to the breaking of a tow rope, and no damage was done beyond the delaying of the sailing for a day.

The Canada Line, operating steamships between Canadian ports and Hamburg, Bremen and Rotterdam, which recently contemplated making additions to its service, has announced that such extensions are no longer to be considered, owing to standing agreements with the C.P.R. and other companies.

The Allan Line's steamships Alsatian and Calgarian, which are under construction at Glasgow, Scotland, are expected to be ready for service in May and August, 1913, respectively. The vessels are each of about 18,000 tons gross register, with engines of about 20,000 h.p., and will average about 20 knots an hour.

A press report from Victoria, B.C., states that the recently formed Pacific Canadian Steamship Co. intends to suspend its service between Victoria, Vancouver and Salina Cruz, for a time, owing to the disturbances in Mexico having interfered with trade, and to the fact that all space on Atlantic freighters has been secured for export of cotton for some time.

G. A. Gibbs, member of the British Parliament, who was visiting in British Columbia recently, stated that, on the opening of the Panama canal, he hopes to see the establishment of a direct steamship line between Vancouver and Bristol, Eng., and mentioned that Bristol is one of the great wheat importing ports of the old world, and with the new Avonmouth docks there, it is in a better position than previously to handle large imports.

D. W. Campbell, of Montreal, Manager, Elder Dempster Co., in Canada, was in Vancouver, recently, for the purpose of studying conditions there, especially in relation to the effects likely to be produced by the opening of the Panama canal. He is reported to have stated that, in his opinion, the opening of the canal will not result in any appreciable decrease of shipping rates, either by the Panama route or the Suez route, and also that he does not consider that any large volume of wheat will seek an outlet by the Pacific coast, mainly for the reason that on an average of eight out of ten years, vessels on the St. Lawrence route are glad to carry grain at ballast rates.

Maritime Provinces and Newfoundland.

The Reid Newfoundland Co. has chartered the U.S. steamship Mexican for its service between Lewisport and Bay of Islands.

During the summer, dredging has been proceeding through the Grandoon flats, in Miramichi bay, N.B., where a cut 200 ft. wide, with a general depth of 22 ft., has been made for 3.3 miles. The cut is being widened to 300 ft., and extended to a 20 ft. contour to make a total length of 3½ miles. The work will be completed before the winter sets in.

The Millerton Extract Co., Ltd., has been incorporated in New Brunswick, with \$98,000 capital, and office at Millerton, among other things to own and operate vessels, wharves, dry docks, etc., and to carry freight and passengers. J. W. and T. C. Miller, E. P. Williston, Newcastle, N.B.; V. Burrill, Shawinigan, Que.; and Jas. McKechnie, Montreal, are the incorporators.

A motor launch, one of five being built at Dartmouth, N.S., for the Marine Department, was launched there, Sept. 5. She will be equipped with engine of 40 n.h.p., developing a speed of about 12 knots an hour. Her dimensions are, length 45 ft., breadth 12 ft., draught 4½ ft., and there will be accommodation for a crew of 10. The second vessel is well on the way, and will shortly be launched.

The s.s. Sagona, which has been acquired for the mail service between Halifax, N.S., and St. Pierre, Miquelon, was built at Dundee, Scotland, early this year, sailing for the sealing grounds in the service of the Newfoundland Produce Co., Feb. 25. The agreement is with the French government, and covers 10 years. The ports of call are as before, with the addition of St. John's, Nfld. She has a net tonnage of 420, with cargo capacity of 920 tons deadweight, and accommodation for 46 first class and 36 third class passengers.

A press report from Ottawa states that tenders for the construction of a car ferry steamboat, for service across the Northumberland strait, between New Brunswick and Prince Edward Island, have been received from a number of British and U.S. firms, and it is possible that the contract will be awarded shortly. The same report states that on account of the currents and the force of wind, ice and water in the winter, the scheme has been declared by some to

be impracticable. All points involved under these heads are dealt with in the report made to the Minister of Railways by Prof. Kirkpatrick, which is given fully on another page in this issue.

Province of Quebec Marine.

The Mackay-Hall Steamship Co.'s steamboat Eastwood collided with the s.s. Rijnarock, near the mouth of the Saguenay river at Tadousac, Sept. 12, during a fog.

The Sincennes-McNaughton Line's steam tug Aurelie G., recently built at Glasgow, Scotland, sailed for Montreal, Sept. 15. During her trials she made an average speed of 11 knots an hour.

The Montreal Harbor Commissioners have decided to increase the capacity of their elevator no. 1, by the fall of 1913, so that with the recent completion of the no. 2 elevator with a capacity of 2,640,000 bush., they will have a total capacity of 5,140,000 bush.

The Postmaster General, in response to a deputation from Quebec, in relation to proposed improvements to the port, stated that the Government was considering the immediate reorganization of the Harbor Commission, which will likely be reduced and placed on the same footing as that at Montreal. He considers it will be better to leave other matters in abeyance until the reorganization has taken place.

The Montreal Harbor Commissioners are reported to have decided to place orders shortly for 12 electric motors and a large quantity of rolling stock for the harbor railway system, which it is said is to be electrified. We have been officially advised that no orders for motors and rolling stock have been placed, and that the matter of electrification is not at present under consideration, though it may be taken up in the future.

During August, 3,664 permits were issued for vessels to pass through the Lachine canal, against 3,406 for August, 1911. Following is a classification of the traffic—wheat, 2,341,393 bush.; oats, 1,723,609 bush.; flour, 94,907 barrels; eggs, 2,166 cases; butter, 907 packages; cheese, 50,752 boxes; apples, 811 barrels. As compared with August, 1911, there were increases in the amounts of oats, cheese and apples, and decreases in the remainder.

Ontario and the Great Lakes.

The Norton Griffiths Dredging Co., Ltd., recently incorporated, has acquired the Daly and Hannan Dredging Co., of Prescott, Ont.

The Mackay-Hall Steamship Co.'s steamboat Robert R. Rhodes ran aground near Alexandria bay, Sept. 12.

Detailed plans for the proposed improvements at Hamilton harbor have been forwarded to the Public Works Department, and it is expected that tenders will shortly be asked for.

W. D. Ross, at one time mate and pilot on a passenger vessel running between Buffalo and Port Robinson, before there were any railways in the district, died at Welland, Sept. 13, aged 91.

It is reported that the C.P.R. will inaugurate a car ferry service between Grafton, Ont., and Charlotte, N.Y., in connection with its new lake shore line. Under present arrangements, C.P.R. traffic is forwarded to south shore ports by the Toronto, Hamilton and Buffalo route.

The recommended draughts for the Sault Ste. Marie canals have been increased by 2 ins., making the draught for the United States Poe lock, and the upward bound draught for the Canadian lock, 19 ft., and the downward bound draught 19 ft. 5 ins.

This is the first time for three years that the Poe lock has had a draught of 19 ft.

Construction on the breakwater off the entrance to Goderich harbor, south of the channel, is proceeding. Six cribs have been put in place, and reach to a height approximately equal to the water level, and the work of building the superstructure is following on closely. The northeast end of the breakwater is 1,140 ft. from the southwest end of the south pier at the entrance to the harbor.

The U. S. steamboat *Britannic*, owned by H. McMorran, Port Huron, Mich., ran ashore at Weavers point, near Morrisburg, Ont., recently, and was reported to have been abandoned as a total loss, after several attempts to refloat her. Later reports state that she had not been definitely abandoned, and that she is to be transferred to the Canadian register. She was built in 1888, her dimensions being, length 219 ft., breadth 36 ft., depth 20 ft.; tonnage, 1,121 gross, 921 register.

The Merchants Mutual Line, Toronto, has secured writs of caveat from the Admiralty Court, and has paid a deposit of \$1,000 a vessel, to exempt vessels operated by it, from possible seizure, thus insuring against loss of time. The vessels covered are: *Acadian*, Canadian, *Renvoyle*, A. E. McKinstry, owned by Canadian Interlake Line, Ltd.; A. E. Ames, *Beaverton*, H. M. Pellatt, J. H. Plummer, *Mapleton* and *Saskatoon*, owned by the Merchants Mutual Line, Ltd.; and D. A. Gordon, owned by the International Steamship Co.

At the annual meeting of the Lake Shippers Clearance Association, in Winnipeg, recently, the report showed profits on grain shipments, \$2,404.24; commission as agents at Duluth, Minn., \$1,027.03; switching and stores earned for shippers, \$15,671.55; Government fees for registration, \$2,499.26; bank interest, \$1,493.68; total, \$23,132.41.

The wreck of the steamboat *Joliet*, which has been a menace to navigation in the St. Clair river, near Sarnia, for some time, has been broken up and removed, and there is now a clear depth over the site of the wreck, of 25 ft., ascertained by sweeping. The vicinity was swept for a depth of 30 ft., and only a small obstruction was found with less than 30 ft. of water over it. This is being removed without further notice.

The contractors have completed the deepening of the western half of the Ballard reef channel in the Detroit river, and are commencing work on the eastern half. In consequence, all the gas buoys marking the latter channel have been moved 300 ft. to the westward. The western side of the channel, for temporary use by vessels of light draught, on the eastern side of, and adjoining Ballard reef main channel, has been marked by five black spar buoys, carrying lanterns, and located opposite the red spar buoys on the eastern side of the channel. Lanterns have been placed on the red spar buoys on the eastern side of the channel for light draught vessels.

The Keystone Transportation Co.'s steamboat *Keybell* was launched at Collingwood, Sept. 18. She is of full canal size, her dimensions being:—length, 258 ft.; beam, 42½ ft.; depth, moulded, 20 ft., with a carrying capacity of 3,300 tons, or about 110,000 bush. of wheat. She is built of steel throughout, and will be equipped with triple expansion engines with cylinders 16, 26 and 44 ins. dia., by 36 ins. stroke, supplied with steam by two Scotch boilers, each 11½ by 10½ ft., under a pressure of 180 lbs. per sq. in. She is of the single deck type, on the arch and web frame system, with holds unobstructed by pillars, and the grain cargo will be handled by the

clam-shell bucket system. A full equipment of derricks and gear for the speedy handling of cargo, electric lighting plant and the usual auxiliaries, will be installed. She will be utilized for the great lakes trade, and on the Atlantic coast, for which she was designed by John Reid and Co., of Montreal. L. McMillan of that company acting as superintendent of construction.

The Peoples Line steamboat *Frontier*, which is at Polson Iron Works, Toronto, for overhauling, was recently reported to be waterlogged at Port Dalhousie, where she had been sent for repairs. Her condition, however, is stated to have been exaggerated. She was originally known as *Empress of India*, and was built at Mill Point, Ont., in 1876, for the Lake Ontario Navigation Co., Picton, Ont., which company is not now in existence, the route covered by its vessel now being operated by the Lake Ontario and Bay of Quinte Steamboat Co., Kingston, Ont. The dimensions of the *Empress of India*, were:—length, 170 ft.; breadth, 26 ft.; depth, 8.5 ft.; tonnage, 579 gross, 336 register, and she was driven by paddle wheels. She was rebuilt at Picton, Ont., in 1899, and renamed *Argyle*, being then owned by the *Argyle Steamship Co.*, Toronto, her dimensions being:—length, 185.1 ft.; breadth, 26 ft.; depth, 9.7 ft.; tonnage, 700 gross, 374 register. She has been operated on various routes, during 1910 and 1911, between Toronto and Olcott Beach, N.Y., and during this year, when her name was changed to *Frontier*, from Toronto to Lewiston, N.Y., on the Niagara route. W. Evans, Steamboat Inspector, Toronto, is reported to have said recently that the vessel was absolutely seaworthy and in good condition when under his inspection in June, and he had received no communication from either the captain or engineer, whose duty it was to report if anything was wrong. He considered that the vessel had been improperly handled and had been allowed to run down for want of proper care and proper repairs, due to her having passed through so many hands, and not all men with practical steamboat knowledge.

British Columbia and Pacific Coast Marine

During August, 74 vessels arrived at and departed from Prince Rupert, in connection with the coastwise trade.

H. M. Davy, engineer, Dominion Public Works Department, is in charge of surveys and borings which are being made in Vancouver harbor.

The C.P.R. vessel which is under construction at Esquimalt, for the British Columbia coast service, is to be named *Princess Maquinna*.

The Marine Transportation Co. has commenced a service between Vancouver and California ports in the freight trade, with its s.s. *Rupert City*.

The Vancouver Terminals Co. is stated to have submitted to the Vancouver city council, a plan for the construction of about 12 miles of dock accommodation at Point Grey.

The British Columbia Transport Co., Ltd., with head office in London, Eng., and with a capital of £50,000, has been licensed to carry on business in British Columbia, with office in New Westminster, and E. J. Fader as its attorney.

The last steamboat scheduled to make connections at Gibbon for St. Michael, this year, will leave Dawson, Sept. 15, and the last vessel of the season to leave Dawson is booked to sail on Sept. 26, thus closing navigation on the Yukon river for the year.

It is reported that the White Pass and Yukon Route proposes to extend its steamboat service down the Yukon river to Fairbanks, Alaska, about 600 miles, and to establish a chain of hotels along the river. The report that the company was about to sell its railway to the G.T. Pacific Ry. has been officially denied.

Telephone communication has been established by the Dominion government for the protection of shipping, between the light station on Lennard island and the government telegraph office at Tofino. There is a land line from the light station to a cove on the northeast of Lennard island, a cable from the latter point to a cove on the west side of Low peninsula, and a land line from Low peninsula to Tofino.

The Dominion Public Works Department received tenders, Sept. 5, for the construction of a breakwater at Ogden point, Victoria. It will extend from Ogden point for 2,580 ft., running southerly for 330 ft., and thence westerly for 1,500 ft., curving northwesterly for 750 ft. On the completion of this work, the construction of five concrete piers will be taken up, together with the necessary warehouses and freight handling facilities, for the general betterment of the harbor.

The Coquitlam Terminal Co. is reported to be carrying out a survey of the channel in the Coquitlam harbor with a view to possible developments. The proposed chan-

Sault Ste. Marie Canals Traffic.

The following commerce passed through the Sault Ste. Marie Canals during July, 1912:

nel will extend from the Fraser mills to the Pitt river bridge, and the harbor, as at present planned, will extend from St. Marys hill to the Pitt river bridge. It is intended to have a channel 1,000 ft. wide. The survey will, it is estimated, cost \$10,000. Soundings show an average depth of water of 30 ft. from the Fraser mills to the bridge, at which latter point, the depth is increased to 55 ft. It is stated that the results of the survey will be turned over to the Government to form the basis of a Government work.

The Coquitlam Shipbuilding and Marine Railway Co. has been organized with \$500,000 capital, for the purpose of establishing a ship building yard for vessels up to about 800 tons, and repairing vessels up to 700 ft. long. L. D. Shafner, of Bridgetown, N.S., who is interested in the company, is re-

ported to have stated that it is fully financed, that he has acquired 8½ acres at the junction of the Pitt and Fraser rivers, and that work will be commenced immediately. The plan is to build sailing vessels chiefly, ranging from 300 to 800 tons, equipped with auxiliary power, suitable for the lumber trade, between British Columbia ports and the West Indies, via the Panama canal.

Capt. E. H. Todd, of the s.s. Strathspey, has communicated to the British Admiralty, the British Board of Trade and the U. S. Hydrographic office, information relating to the navigation of the Fraser river, which is intended to correct false impressions as to the safety of navigation on the river. He states that his vessel, which is 4,432 tons gross, 2,852 tons net, entered the channel fully loaded with 6,000 tons of steel rails

from Sydney, N.S., drawing 22 ft. at high water, and went up to Port Mann without having less than 2 ft. of water beneath her keel. The tidal influence is never such as to materially affect the speed, or steering, and navigation is never impeded by ice at any time of the year. Lights are well placed, pilots are skilful and trustworthy, there are several engineering shops at New Westminster, and considerable works are in progress there which will make it a thoroughly up to date port.

The contract for the construction of a steamship for the Customs service on the Atlantic coast, for which tenders were recently received, has been awarded to J. I. Thorneycroft and Co., Southampton, Eng., the price being £56,300.

Electrically Propelled Vessel of the Lake Trade.

The development of the Canadian canal freight vessel offers as interesting a puzzle to the naval architect and marine engineer as any other class of boat. Nothing is more interesting than to notice how local conditions, such as exist on the Rhine, Danube, St. Lawrence or Mississippi, and other of the great natural waterways of the world, with their canal systems, prescribe a peculiar type of boat. The dimensions of the Canadian canals are of course fixed by the size of the locks through which it has to pass, but as the rush of trade at the beginning and end of the navigation season becomes more and more serious, every inducement is offered in the construction of new types to increase the dead-weight carried each trip on the limiting draft of 14 ft. Hence, no doubt, the experiments now being carried on with various types of internal combustion engines, which by their lightness in weight (both of the engine itself and its fuel), enables a considerable addition to be made to the dead-weight.

The latest proposal, which was referred to in Canadian Railway and Marine World for September, is that now being built in England for the Montreal Transportation Co., in which the propelling power will be generated by twin sets of Diesel engines, each of 300 break h.p. direct coupled to an electric generator, which will furnish current to the propelling motor keyed on to the propeller shaft just ahead of the thrust block. Speed change and reverse will be controlled by a simple treatment of switches which can be handled either from the bridge or engine room without reference to the generating engines, which run steadily in one direction under governor control. Either engine may be cut out for adjustment and there will, of course, be no reverse complication. The introduction of the electrical drive will, it is claimed, enable all the advantages of a twin screw arrangement to be obtained without interfering in any way with the usual form, dimensions and revolutions of the single propeller of the lake type, which has been specially designed, after years of experience with steam, to enable the canal type of boat to be quickly manoeuvred in the canal channels and locks. This is a feature of great importance which, it is said, cannot possibly be obtained with a direct Diesel drive. The new vessel, which will be called the Tyne-mount, is to be delivered in Montreal early in the season of 1913, and its advent on the lakes will be awaited with interest. Unquestionably, marine propulsion appears to be on the eve of developments of a most revolutionary nature.

Dominion Hydrographic Steamship for the Atlantic Coast.

The contract for the construction of a hydrographic steamship for service on the Atlantic coast, for which tenders were recently received by the Naval Department, has been awarded to Swan, Hunter and Wigham Richardson Ltd., Wallsend-on-Tyne, Eng., the vessel to be completed by July 1, 1913.

A full description of this vessel was given in Canadian Railway and Marine World for July, and an illustration was given in the August issue, but we have been officially advised of the following amended particulars:—length between perpendiculars, 170 ft.; beam, 33½ ft.; draught, 11 ft.; displacement, 1,050 tons; average speed, 12 knots an hour.

The Projected Welland Ship Canal.

The route of the projected Welland ship canal has only been very generally decided upon, and there are several points which have yet to be carefully considered, and definitely settled. As soon as this has been done, the plans will be submitted to the Minister of Railways and Canals for approval. The canal generally will follow the present one from Port Colborne to Thorold, Ont., and from thence by a new route, almost direct to McCalla's Grove, situated three miles east of Port Dalhousie, the locks all being located between Thorold and Lake Ontario. The new canal will cross the present canal below lock 11 on the same level, so that smaller vessels will be able to enter either at Port Colborne or at McCalla's Grove.

The total length of the projected new canal is 25 miles, in which there will be seven lift locks, each 800 by 80 ft., and each with a lift of 46½ ft., with 30 ft. of water on the sills. J. L. Weller, M. Can. Soc. C.E., St. Catharines, Ont., is the engineer.

The Rule of the Road at Sea.—A manual on the rule of the road at sea and precautionary aids to mariners, by D. H. Hayne, has been published by the Co-operative Publishing Co., Baltimore, Md. The subject matter is, generally speaking, a digest of the rules and regulations of the Bureau of Navigation, Steamboat Inspection Service, the War Department, Bureau of Light-houses and Coast and Geodetic Survey and the Hydrographic Office of the U.S., with general definitions, comments and applications of the U.S. laws regarding navigation, and comparisons with British navigation laws. While the work is of interest to deep sea navigators, covering as it does, the subject of icebergs, and other matters of recent public interest in that connection, it appears to be chiefly written for motor boat operators, small sailing craft, and yachtsmen. The price is \$3.25, including postage.

The Profession of the Engineer.—In a volume of addresses to engineering students, J. A. L. Waddell and J. L. Harrington have collected and arranged a large number of papers and addresses written or delivered by well-known authorities on many phases of the life and work of civil, electrical, mechanical and mining engineers. The object of the editors is the providing of sound advice to students of engineering and young engineers, so as to indicate how to obtain the full benefit of the course of instruction, how best to conduct themselves at college and in after life, and how to start a successful professional career. The work has been adopted as a text book in a large number of colleges in the United States, and although only issued in 1911, has already reached a second edition. It is issued at the nominal price of \$1—the cost of printing—by Waddell and Harrington, Kansas City, Mo.

The President of the British Board of Trade has appointed a departmental committee on boats and davits to report on the most efficient method of stowing, launching and propelling ships' boats.

Basing the estimate on the amount of fuel required by the s.s. Selandia of 2,500 h.p. and assuming a consumption of 11½ tons of oil a day, it is estimated that the s.s. Mauretania would require 313 tons of fuel a day, or 1,487 tons for a run across the Atlantic. It is estimated that if the Mauretania had a double hull, with 1 ft. between the two skins, she would have storage space in her sides of about 56,240 cu. ft., which would be sufficient to contain the oil necessary to carry her across the Atlantic.

Tel. graph and Cable Matters.

The G.T. Pacific Telegraph Co. has opened offices at Baird, Ont., Ottho, Ebenezzer and Oban, Sask.

S. F. Butzer has been appointed manager, Great North Western Telegraph Co.'s office at Sherbrooke, Que., vice H. F. Byrd.

The Canadian Northern Telegraph Co. has opened offices at Birch river, Man.; Edam, Marengo, Meota, Mistatim and Waseca, Sask., and has closed its offices at Mafeking, Man., and Fuller, Sask.

The Great North Western Telegraph Co. has opened an office at Sixteen Island Lake station, Que., and has closed its offices at Crystal Beach, Donald, Gorrie, Petawawa camp, Rosseau, Royal Muskoka hotel, Zurich, Ont., Cap Sante, Les Eboulements wharf, Manoir Richeleu, Montfort station, Pointe au Pic and Verdun, Que. Its office heretofore known as St. Constant jet., Que., will in future be known as Delson jet.

Wireless telegraph service will be instituted between New York city and Norway, according to an announcement of the Marconi Co. of America. The United States plant will be owned and operated by the company, while the Norwegian station will be government property. The receipts of the two stations are to be pooled and divided equally between the company and the Norwegian government. The company will receive \$350,000 for the foreign station, exclusive of site and foundations (about the price to be paid by the British government for each station in its proposed imperial system), and will secure a royalty of 10% of the gross receipts for 25 years.

Further negotiations between the C.P.R. and its telegraphers regarding rates of pay, etc., were reported to have been concluded, Sept. 18, the company having granted an all round increase of 12%, including overtime, and establishing a 10 hour day standard, instead of 11 hour, as hitherto. D. McNicoll, Vice-President, is reported to have stated that a definite settlement of all matters at issue had been arrived at, and a final agreement would be drawn up. It was also stated that the minimum wages paid to operators at the smaller stations was \$65 a month, and for night operators \$53 a month, the agents at larger stations receiving \$80 to \$110 a month, and operators \$70 a month under the old schedule. The board of conciliation, which dealt with the matter some time ago, recommended an increase of 10%, which the company accepted, as mentioned in our last issue.

It is announced that the Western Union Telegraph Co., on account of representations made by the Postmaster-General of Great Britain and Canada, has made reductions in cable rates, as follows,—for cables in plain words, the present deferred rate of 12c. a word, reduced to 9c., and instead of being subject to 24 hours' delay, will be transmitted with only the delay necessary to give priority to the full rate cables; a letter-gram service will be inaugurated, the rate being 72c. for 12 words, and 5c. for each additional word, to be delivered on the morning of the day following handling; the week end letter cable rates will be, \$1.08 for 24 words, with 5c. a word additional, delivery on Monday; press cables reduced from 10c. to 7c. a word (already in force, but the nine hours' deferment is eliminated). In addition to the foregoing there will be a special press rate, between 12 midnight and 6 a.m., of 5c. a word, and these rates are also applicable between 1 and 4 p.m., Montreal time, equivalent to 6 and 9 p.m., London time, and messages are not subject to deferment.

Car Ferry Service Between Prince Edward Island and New Brunswick.

By A. K. Kirkpatrick, M. Can. Soc. C.E., Professor of Civil Engineering, Queen's University, Kingston, Ont.

The various routes examined between Prince Edward Island and the main land of New Brunswick, with a view to establishing a car ferry, are as follows: Richibucto to West point, Richibucto head to West point, Buctouche to West point, Shediac or Pointe du Chene to West point, Shediac or Pointe du Chene to Summerside, Cape Tormentine to Summerside, Cape Tormentine to Carleton head, Pugwash to Carleton head, Pugwash to Charlottetown, Wallace harbor to Charlottetown, Brule harbor to Charlottetown, John bay, Amet sound to Charlottetown, Pictou to Georgetown, Pictou to Murray harbor, Pictou to Charlottetown, which will be taken up separately.

ICE CONDITIONS. The bord or shore ice forms at all ports and will be taken up when considering each harbor, as it varies in each case, due to the configuration of the shore, depth of water, and exposure.

The pan, rafted, berg, gulf, and lolley ice may be considered under one head, although it varies in quantity in the different places, due to the tides, winds, and shape of the shore, etc.

Pan ice, being the areas of flat ice which forms in the straits and drifts back and forth with the tides and wind, and varies in thickness 6 to 20 ins., would not prove a serious obstruction to a car ferry built on ice-breaking principles.

Rafted ice, or piled ice, is the ice that is piled one cake upon another, usually at the outer edge of the bord ice, where a large field of pan ice, under motion due to the winds and tide, meets an obstruction in its path, such as the edge of the bord ice. Rafted ice may be formed between two large fields of pan ice of which one or both are in motion. The pan cannot be stopped at once, and the immense force behind drives the ice in front, on top, and under the bord ice, in some places grounding in 25 ft. of water, and piling up 10 or 12 ft. above water level. If this takes place at low temperature, this piled ice is frozen into a solid mass.

The rafted ice usually forms at headlands, and grounds on the reefs extending out from the headlands, forming a protection to the bord ice under the lee. It also forms at the edge of the bord ice on straight stretches or bays, where there is sufficient fetch to permit the field or heavy pan ice to get in motion due to the heavy wind, therefore not necessarily forming to the same extent in the same place each year. This rafted ice forms some of the objections of the proposed terminals, and the overcoming of these difficulties may be provided for in the design of the vessel.

Berg ice is only encountered in the spring, when the break up occurs, and is chiefly composed of the rafted ice along the bord ice, which piles on the reefs, breaking loose and drifting with the tide. The evading of these is a matter of navigation.

Gulf ice may be encountered after the break up occurs, and chiefly consists of heavy fields of pan ice, bord ice and rafted ice, from along the shores of the gulf, breaking loose and being driven by the winds into the tidal currents of the straits.

Lolley ice, though not dangerous to navigation, which may slow down the speed of a large steamer, for which provision has to be made in designing the details of the engines, is encountered in the Northumberland strait when the weather is favorable to its formation. From a rough examination of the crystals, and inquiring as to the

conditions of the weather previous to its appearance, I conclude that it is a mixture of anchor and frazil ice. It appears in the form of a heavy dense slush, and sometimes to the depth of 10 or 15 ft., and is buoyant enough to bear up a man when standing on an oar or a plank placed on the ice. The frazil ice crystals are probably formed in the cold water when the temperature of the atmosphere is very low, and a wind stirs the water surface and prevents the surface ice from forming.

The anchor ice, with its sponge like form, is formed on the bottom during very cold, clear nights when the radiation is great. When the sun rises high and its rays penetrate to the bottom, it frees the masses formed, or they break away from the bottom owing to the force of the current.

The ice drifts back and forth with the tide and wind, but the preponderance of the drift is eastward. The young ice forms in the western portions of the straits, and eventually fetches up in the eastern end of the straits, and gains in thickness from snow and frost as it ages.

24 ft. of water would be required at this entrance across the bar. This depth would be difficult to maintain, on account of the littoral drift, also the stopping of the drift to the west of the breakwater is eventually going to weaken the sand beach to the east of the jetty if built, and cause a break, which will weaken the ebb and flow through the channel on which it would rely for its maintenance. This harbor would be very difficult, if not impossible, to make in a north to northeast gale and an ebb tide, on account of the sea and shoal water. Once inside there is a good protection and plenty of water. Good position for a slip could be secured, and when once dredged could easily be maintained.

AT RICHIBUCTO HEAD, N.B., the bord ice forms at from 1,000 to 1,500 ft. out from the shore, and is liable to heavy rafted ice on account of the exposure. Gulf ice may be met with in the latter end of March and April, when the winds are favorable for its movement to this point. This occurs occasionally, not annually. An artificial harbor, as well as about nine miles of rail-

Car Ferry Marquette and Bessemer No. 2, Forcing Through Piled Ice, on Lake Erie.

The littoral drift is principally southward and eastward, due to the prevailing winds and configuration of the shore, and in developing some of the harbors along the straits the littoral drift has to be seriously considered when designing permanent improvements.

RICHIBUCTO HARBOR, N.B. Bord ice forms only a short distance out from the entrance, and is liable to go out a couple of times during the winter, depending on the direction and force of the wind, and on account of its exposed position. A north to northeast wind, with a large field of pan ice, is liable to cause heavy rafted ice across the entrance. The ice in the harbor makes to the depth of from 18 to 24 ins. The old entrance to the east is now partially closed and has only about 10 ft. of water over the bar at low water, and it is only a matter of time until it will be completely closed by the littoral drift. The new entrance to the east of the breakwater may be improved by the construction of a jetty, but on account of the exposed position at least

way, would have to be constructed, including the bridging of the Richibucto river, if it were to be considered for one of the termini of the car ferry service. The bord ice forms as far out as the outer bar, and sometimes rafts heavily at this point, and is liable to go out a couple of times during the winter, depending on the wind and tide. East and west breakwaters would have to be built, enclosing a sufficient area to allow for the manoeuvring of a large vessel, and the exposure that it has and the distance required to go out to get deep water, would make this proposition a very expensive one, and with a northerly gale it would be a question whether the harbor could be entered.

BUCTOUCHE HARBOR, N.B., is protected by a sand beach, along the shore of which there is considerable littoral drift. The entrance is at the east end of the spit and is obstructed by a stone ledge upon which there is only 12 to 14 ft. of water at low tide. There is also an outer bar of sand, on which there is only 14 to 18 ft. of water at low tide. All that can be counted on in the

inner harbor is 16 to 18 ft. at low water. To give 20 ft. of water at low tide to this harbor and its approach would entail a very large expenditure, and great difficulty and expense in maintaining an entrance channel, on account of the littoral drift.

POINTE DU CHENE, N.B. The bord ice forms for about $1\frac{1}{4}$ miles out from the present pier, and is subject to raft ice under favorable conditions, with a northeast to southeast wind. There are several rock ledge shoals covering the entrance to this harbor, and it is $2\frac{1}{4}$ miles from the pier head before a depth of 20 ft. at low water can be obtained. This would necessitate the dredging of a channel $2\frac{1}{4}$ miles long, a part of which would probably be through solid rock. This channel, when dredged, would be expensive to maintain, on account of its exposed position and the littoral drift, as it is exposed to the northeast sea until under the lee of the breakwater or railway wharf.

CAPE TORMENTINE, N.B. The bord ice at Cape Tormentine forms at a straight line from the outer end of the shoals at Cape Jourimain and Tormentine reefs, upon which the ice piles and grounds, and forms a protection to the bord ice. There is a strong tidal current at this point, and between here and the island shore a curious condition of the tide is found, slack water occurring at both shores first, and the reversal of the tides and slack water working out towards the centre, so that the reversing of the tide in the centre of the straits is from 1 to $1\frac{1}{2}$ hours later than on either shores. This condition of current has a tendency to open up leads in the pan ice when the straits are full. A considerable amount of lolley ice is encountered here during severe cold weather. Rafted ice may form at this point when a large field of pan ice is moving under a northeast gale at the flow of the tide. An extension to the present pier would be required, with slip and apron, and a short breakwater protecting them from the seas from the east, the amount of dredging varying with the length of pier extension. The tide varies from 3 to 6 ft. fall in neap and spring tide, with a 3 knot current in the straits.

PUGWASH, N.B. Bord ice forms for about half a mile outside of Pugwash reef, and it is liable to rafted ice with winds from a northerly direction, ice in the roads forming about 18 ft. in thickness. There is a clay bar across the entrance opposite Fishing point lighthouse. A channel would have to be dredged across this bar and the roads, to the channel side of the middle grounds to deep water in the harbor, this distance being about a mile. There are some rock ledge shoals covering the entrance to this harbor about two miles from the bar. The only position available for the slip and railway connection is just outside of the present wharves at Oxley point. The tide at this point is from 4 ft. neap to 7 ft. spring, and causes a current at the narrow part of the channel of about 3 miles an hour. There would be great difficulty in turning a vessel in the narrow river, with the strong current.

WALLACE HARBOR, N.B. Bord ice forms about a mile out, and is subject to rafting with a northeast wind. Harbor ice makes about 18 ins. thick. There is a sand bar covering the entrance, which would require to be dredged. There is from 25 to 35 ft. of water at low tide inside the bar.

The harbor is exposed to a wind from the northeast to east, but a landing slip could easily be protected by a short breakwater. The Dominion Coal Co. contemplate building a coal pier at this point, which will necessitate dredging a channel through the bar and berth of the pier. The greatest difficulty would be in getting a low line for the railway, with shunting grounds, in proximity to the slip. The shore is bald

and quite high and of sandstone formation. The connecting link to the Intercolonial Ry. would be about 7 miles.

TATAMAGOUCHE HARBOR, N.B., is exposed to the east wind, and is very shallow and would require extensive dredging and is out of the question for the formation of a harbor.

BRULE POINT, N.B., which is on Tatamagouche bay, is exposed to northerly winds, and would require breakwaters to be built and a considerable amount of dredging to get the necessary draught of water. The connecting link to the I. R. C. would be about 7 or 8 miles in length, through bald country.

BRULE HARBOR, N.B., which is a part of Tatamagouche bay, is well protected, but would require a channel to be dredged for about $\frac{1}{2}$ of a mile and a turning basin at landing slip. The railway to connect Brule harbor with the I. R. C. would be about 5 miles long.

SALISBURY POINT, N.B., or John bay, which is part of Tatamagouche bay, has 20 to 25 ft. of water at low tide, at reasonable distance from the shore, and, with the breakwater, good protection could be obtained for a landing slip. The railway connecting link would be about 3 miles.

The ice conditions for Tatamagouche harbor, Brule point, Brule harbor and Salisbury point are all similar, being in Tatamagouche bay. The bord ice forms across the entrance to the bay, from 18 to 24 ins., and raft ice piles on the shoals and at the edge of the bord ice. There is a deep water entrance to Amet sound, less than a mile wide, and flanked by the Amet and Waugh shoals, through which there is a heavy current due to the tides, and it would be a difficult place to enter during thick or foggy weather.

PICTOU HARBOR, N.S., has good water inside of bar. Channel crooked over bar, but well lighted with range lights; $2\frac{1}{2}$ to 3 knot current over bar. Bord ice sometimes forms from Lagan point to McKenzie head, and is liable to rafting, with a northeast wind. Heavy drift ice is liable to choke up in the bay formed between Pictou island and the mainland. Tides, spring rise 6 ft. and neap 4 ft. Ice forms in the harbor from 12 to 18 ins. thick.

GEORGETOWN HARBOR, P.E.I. There is good water in this harbor, but it is exposed to a southeast blow. The bord ice forms from 12 to 24 ins. thick, about a mile out, and is subject to rafting with a southeast wind. The bord ice, for a considerable distance in from its edge, is liable to move out several times during the winter, if tide and wind are favorable. Heavy field ice is liable to jam into the harbor, with northeast or southeast winds. A landing slip could be protected by making the easterly leg long enough to provide shelter behind it. There is no current to speak of in this harbor. Tides, spring rise 5 ft., neap $3\frac{1}{4}$ ft.

MURRAY HARBOR, P.E.I. Bord ice forms across the entrance of this harbor, and is liable to raft heavily. The entrance is exposed to the east winds and is narrow and flanked by shoals. There is a bar across the entrance, through which a channel would have to be dredged. There would be great difficulty in maintaining this channel on account of the littoral drift. When once inside there is good protection, but considerable dredging would be required to deepen and straighten the channel and give a turning basin. There is a branch of the P.E.I. Ry. to this point.

CHARLOTTETOWN, P.E.I. There is good water inside this harbor and land locked when inside the narrows. Ice forms from 18 to 24 ins. thick. Current $2\frac{1}{2}$ knots at spring tide ebb, through Battery point to quarantine hospital. Bord ice forms

from Point Prim to St. Peter's island, and is subject to rafting. Under favorable conditions the first ice may raft in one or more windrows inside of the final edge of bord ice to the depth of from 4 to 8 ft. There is a good site for landing slip east of the railway wharf, with plenty of room for turning basin. Tide, spring rise 9 ft. and neap 8 ft.

CAPE TRAVERSE, P.E.I. There is too much littoral drift at this point, and too far to go to obtain deep water.

CARLETON HEAD, P.E.I. The bord ice forms from 18 to 30 ins. thick from the outer end of the piled ice on the reef at Carleton head, to a corresponding point out from Cape Traverse. The early ice is liable to raft in one or more windrows inside of this line. In 1903 the most severe conditions were reported, when it is claimed that the rafted ice grounded in 25 ft. of water in some places. The conditions of the tidal currents and ice in the straits are the same here as at Cape Tormentine. Good water is to be had for a landing slip about 2,000 ft. east of Carleton head, under protection of the point and at a short distance from the shore. This would necessitate the building of a connecting link with the P.E.I. Ry., Cape Traverse branch, of about 2 miles. Tide, spring rise 5 ft. and neap 3 ft.

SUMMERSIDE OR BEDEQUE HARBOR, P.E.I. Bord ice forms from Sea Cow head to the Muscouche banks, with a probable rafting of earlier ice in one or more windrows inside of this line. Under favorable conditions the rafted ice at the edge of the bord ice may be quite heavy. The harbor is well protected when inside of the breakwater. There is considerable littoral drift from the west. The channel would require straightening and deepening inside of the breakwater, part of which work the Public Works Department contemplates doing during 1912. A suitable site can be obtained for a landing slip, with railway connection.

WEST POINT, P.E.I. The bord ice forms in a long, easy sweep from the shoal off West point to Cape Egmont, and is subject to heavy rafting and piling under favorable conditions, when the piled ice will ground in four fathoms of water and is from 20 to 50 ft. wide. This point is exposed to winds from the south and west and with a gale from north to northeast the heavy seas swing round the point and cause a heavy undertow. Two breakwaters would have to be constructed enclosing a large enough area for turning basin. About 10 miles of line would have to be built to connect with the P.E.I. Ry. There is considerable littoral drift to the south and east. The drifting ice is seldom very heavy, and nearly always some open water may be seen, the position of the ice depending on the wind and tide. The current varies from 3 to 4 knots, the heaviest being during the June tides.

TRAFFIC. The summer and fall trade with Cape Breton and the Nova Scotia mainland, especially from the east end of P. E. Island, will not be affected by the car ferry service no matter where the ferry is established, as the water rates will be less than the rail rates. It is the summer shipments to points south and west, and the winter shipments to all points that will be benefitted by the ferry service. With the opening up of continuous winter communication the produce now rushed out in the fall or held over until spring will find an outlet during the winter at better prices, and will very likely affect the direction of the traffic, the bulk of it passing through Moncton on its way to Boston, Montreal, Ottawa and the Cobalt district, Ont. The heaviest passenger travel will also be through Moncton, so that the most

direct route to Moncton, with the most feasible crossing of the straits, should be the one which will benefit the greatest percentage of people on the island. Such being the case this will eliminate the Georgetown and Pictou route, the Charlottetown and Pictou route and the Murray harbor and Pictou route.

HARBORS NOT FAVORABLE. The harbors that are not favorable for the terminus of the car ferry route are as follows:—

Richibucto, on account of its exposed entrance, and difficulty in maintaining a sufficient depth of water over the bar.

Richibucto head, on account of its exposed condition, and difficulty and expense in building and maintaining an artificial harbor, and the construction of about nine miles of railway.

Buctouche harbor on account of its exposed entrance, the expense of removing the solid rock bar across the entrance and the difficulty and expense in making and maintaining sufficient depth of water across the bar.

Pointe du Chene, on account of the expense and difficulty in maintaining a dredge channel $2\frac{1}{4}$ miles long, with a 20 mile exposure and at right angles to a heavy sand drift.

Pugwash, on account of being cramped for room, and the difficulty of turning a large vessel in the narrow channel in a swift current, and the rock ledge shoals covering the entrance to the dredge channel which would require to be about a mile long.

Tatamagouche, on account of being shallow.

Brule point, on account of its exposed position, and amount of breakwater and dredging required.

Murray harbor, on account of its exposure and difficulty of maintaining a channel across the bar.

West point, on account of its exposed position, and the difficulty of building and maintaining an artificial harbor.

ROUTES. The harbors that are considered unfavorable eliminate the following routes: Richibucto to West point, Richibucto head to West point, Buctouche harbor to West point, Pointe du Chene to Summerside, Pugwash to Charlottetown.

The following routes are eliminated on account of the ice conditions and length of haul for the preponderance of the traffic: Georgetown and Pictou, Murray harbor and Pictou, Charlottetown and Pictou.

This leaves Cape Tormentine, Wallace harbor, Brule harbor, and Salisbury point on the mainland, and Charlottetown, Carleton head and Summerside on P. E. Island, to be considered, with the various routes that might be established between these points. The mileage of the various routes remaining to be considered is as follows:

CHARLOTTETOWN AND TATAMAGOUCHE Bay Routes. In these routes, a course common to all, which is about 20

be safer to have a shorter route and one by which the termini could be approached by signal as well as lights.

CARLETON HEAD TO CAPE TORMENTINE. The tidal currents are stronger at this point than at any other, being $3\frac{1}{2}$ knots, but the shortness of the route, a distance of 8 miles, and the openness of approach, would enable the making of the landing stage by sound, during thick or foggy weather. The difference of mileage of Charlottetown and Summerside, from Sydney, Halifax to Moncton via Carleton head and Cape Tormentine, as seen in the table of mileage of various routes, is that Charlottetown is further from Sydney by 145 miles, from Halifax by 66 miles, and nearer to Moncton by 30 miles, than by the shortest route, i.e., by Salisbury point. Summerside is further from Sydney by 81 miles and Halifax by 2 miles, and nearer to Moncton by 94 miles than by the Charlottetown-Point Salisbury route, and as the bulk of the Sydney trade will still be done by water the difference in mileage bears a small part.

SUMMERSIDE AND CAPE TORMENTINE Route. The length of this route is about 20 miles, and would increase the haul on freight secured east of Emerald junction by 14 miles and decrease the haul secured at Summerside and west by 19 miles. But the objection to this route is the danger in navigating the straits in thick or foggy weather, due to the liability to overrun, or under run, one's course owing to the uncertainty of the tidal currents, especially near change and full, and the increased distance in which ice may be encountered.

ROUTE RECOMMENDED. Having considered all the conditions as to harbors and their improvements and maintenance, the routes, their lengths, safety of navigation and probable preponderance of traffic, I am of the opinion that the Cape Tormentine and Carleton head route will be the best and safest route of all those to be considered, will serve the convenience of the greatest number of people, and can be operated daily under all weather conditions by a properly designed steamer, adequate shore signals, and landing facilities.

[Editor's Note. Acting on the recommendation in the above paragraph of the report the Minister of Railways and Canals has selected the Carleton head-Cape Tormentine route. Carleton head is on the south coast of P. E. Island, and on the north shore of Northumberland strait, about 3 miles northwest of Cape Traverse, which is the terminus of the P.E.I. Ry. Cape Traverse branch, which leaves the main line at Emerald junction, 31 miles west of Charlottetown and 16.8 miles east of Summerside, the branch being 11.8 miles long. A connection of about 2 miles will have to be built from this branch, from between Albany and Cape Traverse to Carleton head. Cape Tormentine is on the northern coast of New Brunswick and south shore of

DESCRIPTION OF CAR FERRIES. The following is a short description of some of the car ferries and ice breakers built in various parts of the world:

The Maryland in the fifties ferried the Philadelphia, Wilmington and Baltimore cars across the Susquehanna and transferred to the East river, New York. Capacity, 2 tracks, 14 freight cars.

The Louise was built in the sixties, was built to run between San Francisco and the Oakland Rd.

The Transfer was built in the early seventies to transfer cars across the Detroit river between Amherstburg and Grosse Isle, for the Chicago and southern railways.

The Express, the first ice breaker, was built in 1887 at Oscarshamn, Sweden. Length 139 ft., beam 22½ ft., draught, loaded, 11½ ft., i.h.p. 400, speed 11 knots.

The Isbrytare, an ice breaker, was built in 1881 in Sweden, to keep open Cathenburg harbor. Length 131½ ft., beam 34 ft., draught 12½ ft., i.h.p. 700.

The Oland was built in 1883 at Stockholm. Length 105 ft. 5 ins., beam 24 ft., draught 7 ft., i.h.p. 290, speed 10 knots.

The Bryderen was built in 1885 at Malmo, Sweden. Length 142 ft., beam 32 ft., draught 13 ft., i.h.p. 900, speed 11 knots.

Cape Charles was placed in the early eighties by the New York, Philadelphia and Norfolk Rd. as a transfer steam boat on the route from Cape Charles to Old Point Comfort, across the mouth of Chesapeake bay. Length 259 ft., beam 36 ft., draught 7 ft., capacity 4 passenger cars, speed 18½ miles.

The Solano was put in service in the eighties across the Straits of Carquinez on the line of the Northern Rd., leased to the Central Pacific Rd. The current in these straits runs at 8 miles an hour and the range of tide is 9 ft. Length 424 ft., beam 64 ft., draught 6½ ft., capacity 48 freight cars, or 24 passenger cars, length of run 1 mile.

The Switzer was built in 1885 at Copenhagen. Length 135 ft., beam 25 ft., draught 9¾ ft., i.h.p. 800.

The Starkodder was built in 1885 at Copenhagen. Length 150 ft., beam 27 ft., draught 10 ft., i.h.p. 900, twin screws, speed 11 knots.

The Ice Boat No. 2, a side wheeler, was built in Philadelphia, about 1886. Length 196 ft., beam 29½ ft., draught 10¼ ft.

The Finnish Government designed a steam boat to take the place of the Express. Length 181½ ft., beam 27 ft., draught 13 ft., speed 11½ knots, i.h.p. 650, four bladed cast steel propeller.

The Detroit, a car ferry ice breaker, was built in 1905. Capacity 24 cars, tracks 3, length 308 ft., beam 64 ft., draught 14 ft., screws twin at each end, owner Michigan Central Rd., run Detroit, Mich., to Windsor, Ont.

The Drottning Victoria, a car ferry built in 1909, one of the four of this class between Sassnitz, Germany, and Trelleberg, Sweden, distance 65 miles. Length 370 ft., beam 53½ ft., draught 16½ knots, h.p. 4,400, not an ice breaker. Built at Walker-on-Tyne, England., owners, German and Swedish governments.

The Odin, a car ferry, was built in 1909, to ply between Korson and Nybork, Denmark. Length 293 ft., beam 48½ ft., draught 12½ ft., twin screws, i.h.p. 1,800, speed 15 knots, load 300 tons of cars.

The Christian IX., a sister ship to the Odin, was built in 1908.

In Denmark there are eight connections of railway ferries, their sailing distances ranging from 1 to 26 miles. Over 18 car boats are owned by the Government for working the traffic over these routes. Special ice breakers are in use to keep navigation open during the winter.

	To Sydney.	To Halifax.	To Moncton.	Via
Charlottetown	244	173	159	Salisbury point.
	247	176	152	Brule harbor.
	271	200	135	Wallace harbor.
	389	239	129	Cape Tormentine.
Summerside	292	221	207	Salisbury point.
	295	224	200	Brule harbor.
	319	248	183	Wallace harbor.
	372	223	113	Cape Tormentine.

miles long, is from light to light. One of the drawbacks to this common route is the uncertainty of the tidal currents, and their effect on running a compass course in thick or foggy weather, as evidenced by the grounding of the Earl Grey at Tonny river, her crippled condition very likely contributing to the accident. Another drawback is the shoals which beset the entrance to either harbor. For these reasons it would

Northumberland strait. It is reached by the New Brunswick and Prince Edward Island Ry., which runs from the Intercolonial main line at Sackville, N.B., 36 miles. The N.B. & P.E.I. Ry. will probably be acquired by the Government and made part of the I.R.C. system. The direct distance across the strait from Carleton head to Cape Tormentine is about 9 miles. —Editor.]

The Elsinore was built to act as ferry and ice breaker, her dimensions being: Length 179 ft., beam 43 ft., draught 10 ft., single track capacity 7 cars, single screw at each end.

Four car ferries were built later to accommodate the traffic, two by the Danish government, and two by the German government, two screw boats and two paddle boats, the paddle boats for use in summer only. Length 280 ft., beam 60 ft., draught 13½ ft., i.h.p. 2,600, speed 14 knots.

The car ferry system has also been adopted at the following points: Across the Straits of Messina, the Nordser canal in Holland, also from the Rugen island to Stralsund in Pomerania, and at other points given in this report.

The Ontario no. 1, car ferry and ice breaker on Lake Ontario, cost \$370,000, cars 24, staterooms 100 passengers, length 320 ft., beam 56 ft., draught 15 ft., speed 15 miles, screws twin aft, owner Grand Trunk Ry., built 1906.

The Ermack, ice breaker, not a car ferry. Length 305 ft., beam 71 ft., draught 23 ft. Three stern propellers and one bow propeller, i.h.p. 2,500 each set of engines, with 8,000 h.p., speed 15¼ knots. All engines running 16½ knots forward propeller 13 ft. diameter. All propellers, nickel steel blades (tensile strength 80,000 lbs. per sq. in.). Has steamed through field ice 18 to 24 ins. thick with 6 ins. of snow on top at speed of 8 knots. Went through 1-3 of a mile of rafted ice 20 to 25 ft. thick in two hours. On her trip to Spitzbergen she encountered Polar ice 12 to 14 ft. thick, through which she forced her way at 2½ knots an hour.

The Urimack is a sister ship to the Ermack and has engines of i.h.p. 10,000, triple screws, two at the stern and one at the bow. She is used to keep open navigation through 45 miles of ice to Vladivostok harbor.

The Neva is another Russian boat of the same dimensions and power as the Ermack.

The Finnish ice breaker Sampo. Length 232 ft., beam 45 ft., draught 18 ft., i.h.p. 2,500.

Experience with the Ermack, Urimack, Neva and Sampo has shown that pack ice of practically any thickness can be negotiated. The Ermack on one occasion encountered pack ice 34 ft. thick, 9 ft. being above the level of the field through which she successfully forced her way.

The Baikal, an ice breaker and car ferry on Lake Baikal, Russia. Length 290 ft., beam 53½ ft., draught 18½ ft., 2 screws aft and one forward.

The Delaware, an ice breaker. Length 232 ft., beam 45 ft., draught 13 ft., speed 15 miles, aft engines 2,400 i.h.p., forward engines 400 i.h.p. Two screws aft and one forward, has also a water line deck without camber or sheer, to give additional stiffness, and prevent her being crushed in by moving ice packs.

The St. Ignace, built in 1889. Length 235 ft., beam 52 ft., bow and stern propellers, capacity 10 freight cars, speed 15 miles. This was the first boat built with a bow propeller.

The Sainte Marie, built in 1893. Length 305 ft., beam 53 ft., bow and stern propellers, capacity 18 freight cars, speed 16 miles an hour.

The St. Ignace and the Sainte Marie were designed by Frank Kirby, and built at Detroit, Mich., for summer and winter navigation in the Straits of Mackinac, for the Duluth, South Shore and Atlantic, the Michigan Central and Grand Rapids and Indiana railroads, to make the connecting link between the upper and lower peninsulas of Michigan, the run between Mackinaw city and St. Ignace being 8 miles. Pere

Marquette no. 2, no. 15, no. 19 and no. 20, are all similar and were designed by R. Lagan.

The Pere Marquette no. 20. Length 350 ft., beam 56 ft., draught 14 ft., i.h.p. 2,500 each, twin screws aft, speed 14 miles, 4 tracks, 30 steel coal cars.

The photograph of the Marquette and Bessemer no. 2 forcing her way through piled ice on Lake Erie gives some idea of the class of steam boat used on the Great Lakes for car ferry service. Two of these vessels were lost about 18 months ago, one on Lake Erie, and the other on Lake Michigan. The cause for the one on Lake Erie has never been determined as she has not been found and all hands perished. The loss of the one on Lake Michigan was attributed to leaving the bow port hole lights open when leaving the harbor, and not being discovered until too late to close against the inrush of water, and not being provided with collision bulkhead she filled and foundered.

No. 1 for carrying coal in bulk loaded from tracks on her decks. Length 255 ft., beam 43 ft.

No. 14 has three tracks and is an open deck, and used for transferring cars across the Detroit river. Length 351¼ ft., beam 52 ft.

No. 1 and no. 14 were designed by Frank Kirby, all for the Pere Marquette Steamship Co.

THE TYPE OF VESSEL that would be best adapted for the Northumberland straits would be one between the design of the Delaware and the Bessemer and Pere Marquette types. It should have an ice crushing bow, with bow propeller of special nickel steel, and engines of 200 i.h.p., twin screws aft, with engines of 2,500 i.h.p. each, sea cocks as designed for encountering bolley ice, heavy ice, belt plating, stiffening deck without camber or sheer at water level, to protect hull against pinching by moving ice flows, two railway tracks to accommodate 5 freight cars each, and to load and unload over the stern, and accommodation for passengers as well as crew. This would necessitate a boat about 280 ft. long, 50 ft. beam, 16 ft. draught light and about 18 ft. draught under full load, which would be able to negotiate any of the ice conditions to be found in the straits. Approximate mathematical calculations as to the proper shape of forefoot of ice breaking steamer, and the thickness of ice a given steamer is capable of breaking, were worked out by R. Runenburg, and may be found in Proceedings of the Institute of Civil Engineers, paper 2371, 1891.

CONFIRMATION. Might I suggest that this report be confirmed in its various details as follows: By E. Tiffin, General Traffic Manager, I.R.C., as to the traffic; by F. P. Brady, General Superintendent, I.R.C., as to maintenance and operations; by W. B. Mackenzie, Chief Engineer, I.R.C., who has made a study of this question for some years, and has some valuable information collected, as to the construction, etc.; also by some independent master mariner who is conversant with the navigation of the straits.

I believe that their confirmation of this report would materially strengthen it, and help to allay the feeling of discontent and disappointment that is sure to arise in the places which have been looking forward to having the terminus of the car ferry established at their port.

The foregoing report was made to the Minister of Railways and Canals, who commissioned Prof. Kirkpatrick to investigate the question.

An Ottawa dispatch of Sept. 4, stated that the Railways Department had received several tenders for the construction of the car ferry, from British and U.S. firms.

Lake Vessels and Pilotage Dues in Montreal Harbor.

It is probable that, during the next session of Parliament, amendments will be made to the Canada Shipping Act, regarding pilotage dues in Montreal harbor, in so far as vessels trading from the great lakes are concerned. It is contended that the present regulations constitute a discrimination against vessels from the lakes entering Montreal harbor, as they are compelled to take on a pilot at the mouth of the Lachine canal, or pay the pilotage dues, and also pay a moving charge when changing from one point of the harbor to another, while vessels trading from Quebec are not compelled to take on a pilot, nor pay pilotage dues.

In this connection representatives of the Dominion Marine Association, the Shipping Federation of Canada, and the Pilotage Association, recently met the acting Premier and the Deputy Minister of Marine, to discuss the fulfilment of an arrangement made earlier in the year, whereby assent would be given to the abolition of the pilotage moving charge in any part of Montreal harbor, if the owners of lake vessels would support a scheme for the arrangement and enforcement of regulations governing the traffic in the harbor. The regulations were prepared, revised and sanctioned by both the Dominion Marine Association and the Shipping Federation, and the interview was arranged chiefly to settle the limits within which exemption should be given from the moving charge which lake vessel owners contend is simply a tax on the vessel. The Dominion Marine Association asked that the agreement arrived at be carried out if the regulations now proposed were put in force. The Shipping Federation and the Pilotage Association however contend that exemption from the moving charge should be confined within the limits covered by the regulations. Ultimately it was decided that the approved regulations should be put in force, and that the moving charge be abolished, only within the same limits, which include that part of Montreal harbor extending from its western limit as far east as the eastern limit of the section which includes the Sutherland pier, just east of the Tarte pier. The Dominion Marine Association remains opposed to the imposition of the charge within any part of the harbor, and stays on record as in favor of its complete abolition.

Internal Combustion Engines for Dredges.

—A somewhat new line of development in the application of internal combustion engines is the operation of dredges, and two dipper dredges operated in this manner are now at work on drainage ditch excavation in Iowa. The dredges are in general standard designs of the Marion Steam Shovel Co., which supplied the machinery, the special feature being the application of oil engines instead of steam engines for the hoists. The engines were supplied by Fairbanks-Morse & Co. The dredges were built for D. C. Stephens, contractor, of Buffalo, N.Y., and the design of the hull was modified to suit the engine equipment. Compressed air is used in raising steam in the auxiliary boiler.

The Dominion Government has approved the Montreal Harbor Commissioners' by-law prescribing a system of signals, consisting of semaphores by day and lights at night, for use in the Montreal harbor from the Tarte pier to the Lachine canal. Hitherto small vessels have passed from point to point without any system, causing a number of minor accidents, and endangering shipping.

The Diesel Engined Vessel Eavestone.

The preliminary trials of the vessel Eavestone, built at Middlesbrough, Eng., for Furness Withy and Co., which took place recently, are considered to have been extremely successful. Her dimensions are:—length, 276 ft.; breadth, 40½ ft. moulded beam, with a deadweight capacity of 3,600 tons. She is engined by Carels-Diesel engines of the four cylinder, two cycle type of 850 h.p., with a service speed of 115 r.p.m., being practically a duplicate of the engines supplied for the Canadian Inter-lake Line's vessel Fordonian.

The construction is comparatively simple, there being an open crank pit, with box columns supporting the cylinders, and the open crossheads working the air scavenging pumps. Comparing the vessel with a similar one of the steam driven type, the extra space available for cargo on a 30 days' trip amounts to about 400 tons, due to the less space taken by the machinery. In the course of the trials, the engine was kept running at full load for over nine hours and no trouble of any kind was experienced, and on her maiden trip to Antwerp, Holland, the governor was set for 86 r.p.m., and when the propeller was thrown out of the water, the maximum speed was 92 r.p.m., coming back to 86 r.p.m. in less than five seconds.

It is said that Furness Withy and Co. may place the vessel on its Canadian service.

PATENT ACT.

TAKE NOTICE that manufacture of Nut-Locks constructed in accordance with Canadian Patent No. 28,091, issued September 13, 1910, to Milton Bartley, has been commenced in Canada by W. H. Banfield & Sons, of the City of Toronto, who are prepared to supply any demand for the same at a reasonable price. Ridout & Maybee, 58 Yonge Street, Toronto, Attorneys for the Patentees.

The Merchant Service Guild of British Columbia has recommended to the Minister of Marine that the passage in the Seymour narrows, known as the Maude island channel, be closed, on account of the danger to navigation caused at certain stages of the tide by swirls extending out into the main channel. The channel is about one twelfth of a mile wide, and it is stated that the blocking could be carried out at small cost.

During July, four employees were killed, and six were injured in the course of their work in connection with the navigation of Canadian waters. Of the fatalities, two were due to drowning, and one each to a fall, and to being struck by machinery, while of the non-fatal accidents two each were due to machinery, and falls, and one each to an explosion of kerosene, and to falling material.

Ramapo Automatic Safety Switch Stands

No. 20

This style is especially adapted for use in yards. The throw is parallel. There are no gears. The handle is lifted at an angle at which it can be most quickly grasped, and the stand can be operated with the greatest ease and speed.

The stand measures 10 $\frac{1}{2}$ " from top of tie to top of base fixtures and is furnished preferably with our standard enameled target at such height and of such shape as may be desired. The target is cut out and reinforced at the top to admit lamp tip, so that the only projection above the target is the fit for the lamp socket.

PISTON AIR DRILLS

ARE GUARANTEED 30 P.C. MORE
EFFICIENT THAN ANY OTHER MAKE.

They have the *Corliss Valve Motion*, conceded by Engineers to be the greatest valve mechanism used in any air drill. Are equipped with *Telescope Screw Feed*, allowing for the longest range in drilling. Are made in all capacities suitable for drilling, tapping, reaming, rolling flues, wood boring, stay-bolt work and close corner work.

Don't fail to give these machines a trial. Write for circular G and our proposition before placing your order.

EDISON BSCO

PRIMARY BATTERY

The Standard Closed Circuit Cell

The Edison BSCO cell occupies a prominent position among the sources of current that are practicable for railway signal work.

In planning a signal system, the first consideration is, undoubtedly, efficiency; the second, to carry the installation as far as possible with the available funds.

Little need be said concerning the Edison Cell along the lines of efficiency, signal men being familiar with its ability to do the work in a manner that leaves nothing to be desired. From the standpoint of enabling the railroad to make the best possible use of its money, however, it is generally conceded that a signal system can be installed on a great many more miles of track, if the Edison BSCO Cells are used than is possible with any other source of current of equal reliability.

In addition to the moderate first cost, the Edison BSCO cell is inexpensive to maintain. Its four hundred ampere hours capacity (a year's service on the average railroad), the fact that it requires no attention from one renewal period until the next, a construction peculiar to itself, designed to make the operation of renewal simple and economical in the expenditure of time, all tend to give the Edison BSCO Battery a position that entitles it to respectful consideration when the question of current supply is under investigation.

The use of Edison Cells carries with it the satisfaction of knowing that a source of current has been adopted, which, for reliability, moderate first cost and economical maintenance is unsurpassed.

"STANDARD" QUALITY

You Pay For Good Wire

whether you use it or not. If you buy a cheap wire, "made to meet a price," you may pay several times the cost of good wire in replacement of your wiring or of the building in which it is installed.

"Sterling" Rubber Insulated Wire

is made to maintain a standard, not to meet a price. The price, however, is as low as that for which a product of equal quality can be sold.

Our new booklet, "*Sterling*," gives valuable information about rubber covered wire. Sent on request.

Standard Underground Cable Co. of Canada, Ltd.

Department C

Hamilton, Ont.

Manufacturers of Electric Wires and Cables of all kinds, all sizes, for all services, also Cable Terminals and Junction Boxes, etc.

"STANDARD" ECONOMY

Only Six Parts!

O-B Type D Trolley Frog

Think of it---a Frog with renewable tips that has *only six parts*.

A single machine bolt used---*no nuts*.

Tips clamp wire *securely* by *cam* action.

Ample clearance for wheels in pan---smooth under-run.

Can be installed *much quicker* and *easier* than any other Frog.

A Sample will prove it

Made in all bronze or with malleable pan and bronze tips.

See pages 170-172 of new Catalog No. 12. Sent duty paid on request.

Synopsis of Dominion Land Regulations

Any person who is the sole head of a family, or any male over 18 years old, may homestead a quarter section of available Dominion land in Manitoba, Saskatchewan or Alberta. The applicant must appear in person at the Dominion Lands Agency or Sub-agency for the district. Entry by proxy may be made at any agency, on certain conditions by father, mother, son, daughter, brother or sister of intending homesteader.

Duties.—Six months' residence upon and cultivation of the land in each of three years. A homesteader may live within nine miles of his homestead on a farm of at least 80 acres solely owned and occupied by him or by his father, mother, son, daughter, brother or sister.

In certain districts a homesteader in good standing may pre-empt a quarter-section alongside his homestead. Price, \$3.00 per acre.

Duties.—Must reside upon the homestead or pre-emption six months in each of six years from date of homestead entry (including the time required to earn homestead patent) and cultivate fifty acres extra.

A homesteader who has exhausted his homestead right and cannot obtain a pre-emption may enter for a purchased homestead in certain districts. Price, \$3.00 per acre. **Duties.**—Must reside six months in each of three years. cultivate fifty acres and erect a house worth \$300.00.

W. W. CORY,
Deputy of the Minister of the Interior.

FERRANTI

Traction Meters

The demand for Car Meters has grown very rapidly and the economies effected by the installation of these instruments have more than justified their use.

The guaranteed accuracy of the Ferranti Traction Meter is $2\frac{1}{2}$ per cent. from full load to 1-10th load.

Will stand 100 per cent. overload for ten minutes.
